Stopping at Cherrystone only long enough to load our traps, and an attempt to dispose of a dozen on the half shell, a feat beyond our gastronomic capacities with these mammoth bivalves, fifteen miles brought us to the coast. Mac and the sloop awaited us, and in a few moments everything was, to use a nautical phrase, "snug and ship-shape." Then we began to take in the surroundings. Our cabin was fearfully limited in space; like Captain Dick's apartment, it was so small that you couldn't swing a cat in it without hurting the cat; only a dwarf could stand upright, in fact, a big dry-goods' box is the best simile I can think of. A minature stove sat in the centre; on each side were the bunks, and such sleeping accommodations! Not longer nor wider than a coffin, once in you were wedged tight, indeed, our Joe who has big feet could not turn over without getting out of bed. Our crew consisted of the guide, an ordinary looking man, and his mate Joe. Now, Joe was a character that Hogarth or Felix Darley would have loved to have limned and Dickens to have made one of his character sketches of. He was nearly seven feet high, but a constant life in the low-roofed cabin had so bent his body that he always walked, even in the open air, as if he had lost something and was looking on the ground for it. Joe confessed to be but thirty-eight years old, but he looked fifty, the heat of the stove that he was continually roasting over, for Joe was the cook of this craft, had seamed and lined his features, until he looked as if old Father Time himself had set his sign and seal upon him. Joe's face was a study. In profile it was a half moon, with a nose in its centre that Julius Cæsar would have been proud of; a huge nose indeed that sounded like a fog horn when Joe blew it with his fingers, which he always did. Underneath was a mouth that wise Dame Nature had made when she took in consideration the long, flexible body that had to be filled—for the larger the hold the bigger the hatchway. It was a mouth equal to the one that little Red Ridinghood saw when the supposed grandmother popped her head out of the bedclothes. Joe's ears opened wide like a retriever on a dead stand, and his head was surmounted with the thickest, bushiest shock of hair ever seen. Joe was, albeit, not the glass of fashion or the mold of form, yet has that sterling honesty, simple mindedness and perfect good nature which are better than outward show. If Joe had one fault it was that of Uncle Toby, and Heaven would forgive him, for he means nothing by his oaths.

Shortly after our arrival night set in, the solitary lamp was lit and by its dim light Joe proceeded to get supper. The little stove grew red hot, and the hatchway had to be opened. Coffee was boiled, meat fried and bread cooked, and the long ride giving us an appetite we crouched down and made a hearty meal, then a walk on deck with our cigars to give the guides time and place to eat their supper

It was a beautiful night, calm, clear and mild; the broad firmament gemmed, as Hamlet has it, with its golden fire; the air, laden with salt, is fragrant to the lungs; the bay reflects back the myriad stars. Across the way is seen the gleaming white light of Cape Charles, that every forty seconds revolves and flashes a broad pathway across the still, calm waters. It is such a night as Nature seemed to have robed herself in a costume of spectral white, and charmed all with her weird, enthralling loveliness. To descend from the stars down in the little cuddy hole is a descent indeed. But it is getting late, and we must be off by day to-morrow. So we make preparations for retiring, which consist in taking off our boots and wrapping up in an old dirty coverlet that was grimed with dirt and smelled—Jupiter, how it did smell! After having tucked us in the guides placed a sail-cloth on the floor, and Joe, doubling up his legs, spread a blanket over him and Mac, blew the light out, and then snores—one a tenor and Joe's deep bass—soon showed that slumber had weighed their tired eyelids down. Not so with us, the close imprisoned condition we were lying in, the hard planks with no pillet kept us awake. Hours passed on, and "sleep—balmy sleep that knits up the ravelled sleeve of care"—was not for us. It was pitch dark. The swishing of the water against the oaken bottom, not two inches from our bodies, kept our senses painfully on the alert. The noisome, mouldy perfume of the bed clothes, the varied smells of lamp oil, stale cooking, old clothes, all combined made a horrible mephitic odor that arose in heavy exhalation and could find no vent, for the door of the cabin was closed tight. To my comrade, all unused to rough it, and a perfect Sybarite, the situation was torture.

Dawn came at last—a bright morning—but we did not get under weigh until near noon. And then slowly making our way along under a ripple of wind came to anchor off Smith Island, some ten miles from Cobb's, and about a mile from the mouth of the Chesapeake. A southwest wind now arising, we went to the blinds, placed out the decoys—but it was a bad day, and the ducks did not fly. Though we sat there until dusk only four brant rewarded our efforts. That night we rested better, as our noses grew more accustomed to the confined air of the cabin. The scond day it rained, and we took a tramp on the island—only getting wet and mad for our pains. The third we were out only two hours, and killed only one little deadapper. The morning of the fourth was chiefly spent in trying to get warm—or rather Mac said it was too cold for ducks—and we doubled up, waiting for the wind to moderate; but it still keeping up we insisted on going to our blind. Phew! it was cold. The wind cut like a knife, and blew so hard that the waves were capped with foam. Still, we did not suffer. Each of us had on two pair of drawers, two pair of pants, and a pair of canvas breeches over them. Our bodies were covered with three woolen shirts, vests, coat and oilcloth. Three pair of yarn socks, over which our rubber boots were drawn, kept our feet comfortable—only our faces were blinded with tears when we faced the breeze. The decoys were put out, and we took our position in a small boat inside of the blind, which consisted of cedar bushes stuck in the mud. Mac and his large boat went to a blind some half a mile distant where he concealed himself. It was low water, and the bars around us were covered with snipe in numberless quantities; but we kept quiet, though we were sorely tempted to shoot. The wind was now rapidly rising, and at last a regular nor'wester was whistling around us The tide was on the flood and rushing like a mill-race, and soon the brant, the gamest bird that flies, commenced to move. Here come four in one bunch. We fire, and three fall dead, the other dropping in the waves a couple of hundred yards away. Hardly had we slipped fresh cartridges in when a large flock was seen heading directly for our decoys. We crouched low and waited for them, with every nerve strung to a tension. They wheeled by on the pinions of the wind like a flash of light, but the lead was more swift, and two fell from the flock. But see! here comes a single bird, who circles around and finally alights outside of the decoys We did not waste a shot on him, for the brant now fly in squads, in couples, and flocks, and every few seconds our guns speak out. The sport was glorious and exciting, but it soon came to an abrupt conclusion—the stiff nor'wester was now changed into a gale, and it howled as if so many demons of the deep were unloosed. Just at this time McKown passed by, luffed and ran alongside of us. He cried out:

"Jump on board." We did so, and left our boat adrift.

"Why don't you get the boat and the decoys?" said Fox.

"The wind is too stiff," said McKown, who was undoubtedly scared and thought of nothing but safety. "It's blowing so that I won't try to reach the sloop, but will have to make a run for Smith Island." So saying, he placed her head before the wind and in a few minutes the boat's head struck upon the sand.

Now, neither Fox nor myself were sailors, but we had common sense enough to know that Mac was so timid that even a breeze made him look longingly at the nearest land. He lived in perpetual fear of storms, hurricanes and cyclones. He was always in expectation that the wind was going to *bust* into an everlasting tempest, and that he would be, like old Mrs. Gummige's son, drowned*ead*. And we knew there was no real necessity for running into shore at a time when the ducks were just sailing around the decoys. "Four days gone," significantly said Fox, holding up his fingers of one hand, "at $8 a day—and no ducks."

The keeper of the St. Charles Lighthouse received us most kindly and hospitably. He is an educated gentleman, having taken his degree of A. M. at the University of Virginia. Though surrounded by his wife and children his is an inexpressibly lonesome and dreary life. The days seem like weeks, the months like years, the time drags on with leaden heels, and the monotony is well nigh unendurable. Truly could he exclaim with Alexander Selkirk on his lonely Island,

> "Oh solitude where are the charms
> That sages have seen in thy face."

The eternal sameness and utter isolation from all mankind is hard to bear, for man is a sociable animal and needs company. It must have been such a place as this that caused the plaint in Locksley Hall

> "The weary waste of waters,
> The barren, barren shore."

The next day, instead of being up and early at the ducks, it found Mac toasting his shins at the fire, and as it was near sunset before we were in the blinds, and in the meantime the wind had gone down, the result was nary a duck. "Another day gone," said Fox. Out of temper we pulled back to the sloop, and found that Joe had fulfilled, as he always did, his contract, and had a hot supper awaiting us. After the meal over our pipes we listened to Mac's vivid description of what he was going to do. Fox and myself glanced meaningly at each other, while Joe sat half enveloped in a cloud of smoke that poured from his mouth, his whole attitude expressing a perfect content, that it was none of his funeral as he wasn't after ducks.

"Joe," said my friend, "are you fond of gunning?"

Joe grunted out a negative.

"Why?"

"Cause I most killed myself once, got nuff of guns to last me."

"How did you do that?"

"Well, it happened some years ago when I was a boy. The old man had an old ducking gun of No. 4 I believe, that always sat in the corner in the passage. He told me he'd thrash thunder outer me if I ever totched it, so I dassent handle it. One day a large hawk come and sit on the barn, and I runs and grabs the piece meaning to shoot her anyway, thrashing or no thrashing. I crept behind the cornhouse and peeped around the corner, and there sat the hawk a waiting for a chicken. I tried to draw back the hammer, but it was rusty and I couldn't, so I drops on my knees and puts the butt of the gun against the pit of my stomach and pulled. I had nearly got it cocked when the hammer slipped out of my fingers and it went off. At fust I never knew what happened; then I thought that Mose, the brindled bull, had butt me, or that Sally, our old blind mule, had plugged me; then marm come running out screaming that I was killed, and the old man—" here Joe stopped to fill his pipe.

"Well, Joe, what did he do? Did he scream too?"

"Scream!" said Joe with scorn in his voice, "he wasn't that kind. No; he picked up the old piece, carried it in the house and walked off to the woods, and by the time that marm had got the cramp out of my stomach he came back with a hickory sapling and just tanned the hide ofen me."

After an early breakfast we remained in the blinds during the flood tide, and had a spurt of good luck, but the wind was not high enough, so we returned to the sloop early and passed the rest of the day after the guides' fashion—in the cuddy hole over the stove. "Another day wasted" I remarked.

"Yes;" said my comrade; "I am getting tired of being imposed on. Here we are paying four dollars apiece and we don't get two hours' shooting a day, and it is fine fun for Mac to doze over the fire all the time and play us off with what he is going to do. Here are millions of snipe within pistol shot of the boat, and he hasn't even deigned to carry us to shoot them. I'm going back home to-morrow."

"Yes," I replied, "the whole trip, is a fraud and I will go back too."

That night we notified the guide of our determination, and he promised to carry us to the blinds at daybreak, hail, rain, wind or sunshine.

"How's the weather Joe?" said Fox, poking his head out of the bunk as the gray dawn came stealing in the pane of glass that constituted the window.

"I don't know, but I will see," assured Joe as he unconsciously paraphrased the words of the game that children and even grown people are fond of indulging in called "The Shaking Quaker." So, yawning like Mount Ætna, Joe arose up and almost burst his skull against the low ceiling.

"Durn me for a fool," said Joe (*sotto voce*) "that's five hundred times I have done that; 'pears to me I never will learn sense. Wish my blasted head was off, anyhow."

"Raining like blazes," he shouted, after taking a survey of the weather through the cabin door.

So we remained in our shelves, watching the breakfast being gotten ready. Joe could scare one up in ten minutes when he was in a hurry, but this morning he took his time leisurely, and had a real artistic meal set before us. "I never have no appetite noway when I have to cook," said Joe, and then he sits down and eats enough to make a half a dozen men ill with indigestion.

Noon by our watches and still the rain came down with one of those steady pours that looked as if it meant business and did not intend to leave off. Cramped, cribbed and confined as we were in the cabin, we were glad to put on our waterproofs and take a trip on Shell Island. A tramp of a couple of miles showed us nothing, and so we returned out of sorts and disgusted back to the sloop.

"Another day gone and nothing to show for it," said Fox.

The next morning it was blowing great guns, and the ducks flew beautifully, but our guide Mac curled himself in the bunk, with a congestive chill, as he said; I and my comrade smoked our pipes in wrathful silence.

Both Fox and myself had enough of this, and we insisted on returning home. So Captain Joe commenced to raise the anchor; then by our assistance the sails were spread, and then Mac coming out of the cabin, seized the tiller and steered. All went well until the sloop turned sharp to the right, up a bend in the river, where she ran right in the teeth of the gale. She could make no headway, so the anchor was dropped and the sails were reefed. Then she kept on her course; the wind shrieked, the cordage rattled, the sails flapped, the masts creaked, and the sloop, with the blast on the larboard side, cut through the water with the speed of a racehorse The waves swept the decks clear; the water-casks went first, then all Joe's wood, next Mac's decoys, my hat blew off, and it was the biggest kind of a time. Inside of the cabin there was the devil to play; the boat careened so that the stove slipped aside and broke the pipe off, and the cabin was filled with a dense smoke. Then could be heard the crash of glass as the lamp slid off the shelf, the crockery clattered, the knives jingled, the pans rattled, and it seemed as if the last hour was at hand. Fox and myself stood in the cabin with our heads out of the door. Joe clung to the anchor chains forward, while Mac steered the boat by means of a rope hitched around the tiller. The water was rapidly shoaling now, but the wind still beat the waves up high and bellied out the canvas to its fullest extent. Mac clung like grim death to the rope. All at once the line slipped off of the end of the helm, and the holder disappeared from view into the bubbling tide beneath.

> "And is he gone? Oh, sudden solitude,
> How oft that fearful question will intrude!
> 'Twas but an instant passed and there he stood,
> And now —"

"Save me, for God's sake!" came a cry from the stern. We looked over, and there swung Mac, the other end of the rope being tied fast. "Save me!" cried the pallid lips; "save me!" uttered the imploring eye, and more dead than alive we hauled him aboard. Scared? No, sir. He was only a little demoralized; he hadn't touched bottom all the time, but hung suspended by the rope. The water was only two feet deep and the keel had sunk deep in the mud.

"Thank Heaven! I've escaped from a watery grave," he cried, as he reached the deck.

"Dog gone it," said Joe, "he must have waded in shore; the water ain't 'bove his boot-tops."

And so the trip ended, and we left him wiser, poorer and, as Artemus Ward has it, sadderer men. Yet we were safe; not the ill luck of Canon Kingley's "Three Fishers" was ours, only—

> "Two sportsmen went out in a ducking sloop,
> In a ducking sloop as the tide went down:
> They came back safe but thoroughly scooped
> Of the cash they had by Kenneth MacKown.
> But the guides must live and hunters must pay
> When they go ducking near Chesapeake Bay;
> And the guides do nothing when they charge by the day
> But to anchor by the bar that's moaning."

CHASSEUR.

THE FLIGHT OF RIFLE BALLS.

MT. FAIRVIEW, San Diego Co., Cal., Feb. 14.

THE excellent article by Major Merrill on the above subject calls up a question which has long puzzled me, and I should be obliged to any one who will satisfactorily solve it.

He says "It is as mathematically certain that the rifle does not carry straight for ten yards, as that it does not for 1,000 yards. Gravity is always pulling the bullet down; its effect commences at the muzzle of the gun, and no velocity of the ball can cancel it."

This is the common opinion of the best authorities; but just for fun I propose to dispute a part of it. I have the highest respect for mathematics, and am not one of those who back their own "experience" (miscalled so) against all philosophy. At the same time there is some room here to doubt the proper application of mathematics, or rather philosophy, in this case. That no velocity of bullet can cancel the effect of gravity is absolutely indisputable. But is it correct to say that the effect of gravity commences at the muzzle of the gun?

That gravity is acting upon the ball all the time of it passage up the barrel is undeniable. But are you sure that that action produces downward motion instantly? In other words can force be converted into motion instantly? Can any force overcome instantly the inertia of the ball?

It is clear that at the instant of the ball's passing the muzzle that although it has its forward motion it is as regards its downward tendency in a state of inertia.

That inertia requires time to overcome it is as certain as anything in philosphy. I admit that ordinary cases of over

coming inertia by the sudden application of force, as the gas of powder, etc., are not analogous. The motion must there be imparted from molecule to molecule; whereas, in the case of gravity, the force is exerted upon every individual molecule at the same time. But can the inertia even of a molecule be instantly overcome?

You cannot escape this by saying that inertia is only a negative agent, and is already neutralized by the action of gravity. We all know that a No 12 brass shell may be filled half full of No. 10 wads that would require a pressure of 50 pounds or over to force them through the barrel by hand. This pressure, too, would have to be constant. Yet a charge of powder will blow them out of the gun at a high velocity, and with very little recoil. Put in three ounces of shot so loosely wadded that one pound pressure by hand will force it through the gun barrel and it will have little velocity and will nearly unjoint your neck with recoil if you drive it out with powder. In the one case we have 50 pounds (a constant resistance too) of friction. In the other we have only one pound of inertia. The friction is truly a negative agent. But about the other there is a stubbornness that seems terribly positive when you come to experiment with it.

This is further exemplified by the fact that with no amount of powder, however quick or however arranged, to burn faster as the ball advances can you impart the initial velocity to a ball twice the weight of round ball of same calibre that you can to the round ball with only a moderate charge.

Now, then, can gravity overcome this any more than powder? That gravity is constantly acting on every molecule is true. But the powder force when once developed and when the ball is half-way up the barrel is extremely near to doing the same thing. Yet if the ball be very long a great increase in the powder adds little increase to the velocity, and the force is mainly lost in recoil. There is here some resisting agent besides the time lost in imparting the increase of motion from molecule to molecule. That is not enough to explain the great difference between the velocity of one ounce of shot and one and a half ounces between a short ball and a long one; must not the extra resistance be looked for in the molecule itself?

I strongly suspect that the more philosophical state of the matter is this: The ball tends to fall at the instant of its escape from the muzzle, but as force cannot instantly be converted into motion it remains in equilibris for a fraction of time during which it will be driven on a level line

The experimental proof or disproof of this would of course be very difficult. I doubt if any instrument could be made without great care or expense that would test the question. I suggest the following, however, as the nearest practical approach to it:

Take a very accurate rifle and sight it at ten feet with the finest globe or telescopic sights to a dark line the exact distance below another dark line that the line of the axis of the bore is below the line of sight. Load it with the heaviest charge of powder consistent with accuracy and a round ball; none of the slow lumbering long range balls. If you do not know how to make a round ball work in a breech-loader whittle down a conical one to nearly the same weight, or, what is better, take a good muzzle-loader of large calibre, then sight at the upper line. In this way you will get the line of fire and line of sight very nearly if not perfectly parallel. Then begin shooting at as few feet from the muzzle as possible, and increase the distance until you first notice a drop of the ball. I will warrant you that there is a distance—much longer too than you would suppose—at which you can detect absolutely no fall whatever.

I have just tried this with a rifle which I have used for the past three years and which has gained me many deer by its immense level reach (practically so) which I would have lost if I had had to make any allowance for distance. It is a breech-loading 16-bore (.65 cal.) double express, probably the first one made in America made to order for me by Nichols & Lefever. After trying everything else from .35 up, hunting with all the boasted American "sporting" rifles, having all the work in hunting crippled deer that I wanted, and having fed enough buzzards and coyotes, I have killed 150 odd deer with this and have never hunted for fifty yards one that was struck anywhere in the body. I can truly say that I would not have it a single 100th part of an inch smaller. To the small-bore men who feel disposed to jeer at this I can only say I have tried all yours. Have you tried mine?

This rifle is extremely accurate, but as I had no telescopic sights and only coarse globe sights, and as I shot at considerable distances and had to use a fair-sized bullseye, the experiment was not as close as I would desire. But the following was the result:

Sighted to cut at ten yards the lower edge of an inch bullseye (so as to get the line of sight and the centre of the line of fire parallel) I could detect no drop at fifty yards. At seventy-five the ball was in the lower edge of a two-inch bullseye; at one hundred at the lower edge of a four-inch bullseye. This was with a hardened round ball, patched with heavy parchment, well greased, with six drams of Eagle Duck No. 2 and H. Izard's Electric (finest grain) mixed. The ball weighed just one ounce and went as true as ever ball went from any rifle, the horizontal variation of several shots being less than one inch at one hundred yards. It seems impossible for this ball to have touched the line of sight anywhere, though of course it may have risen a little owing to my want of facilities for getting everything exact. The recoil was no worse than that of a shot-gun properly loaded for ducks. Length of barrel, twenty-nine inches; weight of rifle, eleven pounds.

A word as to point blank. Whatever may be the truth as to an actual natural point blank, or the throwing of a bullet on a level line for any distance, there is, in fact, as nearly all hunters with the rifle well know, a practical natural point blank. The above experiment shows this. The words "natural point blank," which have been so much ridiculed by the ultra-scientific, should be retained as expressing a practical and highly useful fact. I would define it to be this: that distance at which a rifle without any rise of the ball will strike the regulation bullseye for that distance. Under this definition the point blank of my rifle would be one hundred yards and much farther if held over the centre of the bullseye without being held above the upper edge.

Major Merrill has relaxed his usual caution about exactness in his use of words, ect. In speaking of trajectory he should have specified the rifle, ball and powder used. I get a very different trajectory with my rifle from the one he there speaks of. At one hundred and seventy-five yards, sighted level as before, the drop was only fourteen inches below the centre of an eight-inch bullseye. This would catch a seven-inch ring the whole distance and make it almost impossible to miss a deer up to one hundred and forty yards by any mistake of distance. In fact I hold square on everything with level sights right up to that distance.

The trajectory of a ball depends almost entirely on the relation of the weight of the ball to the calibre. The relation to the weight of powder is trifling compared with this. Bullets may be designated as Nos. 1, 2 and 3. No. 1 would be the round ball, the lightest one ever used. No. 2 would be about twice its weight (of the same calibre of course). No. 3 would be three times its weight. No. 2 is about the size of the Winchester ball, while No 3 is about the size of the Creedmoor ball. These proportions are perhaps not exact, but nearly enough so for our purpose.

Now, by no possible amount of powder can you drive No. 3 to one hundred yards on as flat a trajectory as you can No. 2. Nor can you drive No. 2 as far on a level as No. 1, provided that No. 1 is large enough to have sufficient actual weight as well as relative lightness. The more you increase the length of ball the less effect does the powder have upon the initial velocity and the more effect does it have upon the shoulder. On the other hand, the lighter the ball in proportion to the calibre the greater the effect of the powder in increasing velocity and the greater quantity you can shoot. Had the ounce of lead I used in the experiment above mentioned been cast into a .44 ball and fired from a Creedmoor rifle with six drams of powder it would have dropped at least eight inches under the mark at one hundred yards, and the man behind the rifle would have dropped eight or ten feet somewhere else.

But unless the light ball has actual weight it will lose its velocity very fast. And this actual weight can be given only by enlarging the calibre. Any attempt to increase it by lengthening the ball only reduces its velocity at short range, increases the recoil and lessens the amount of powder you can use.

The trajectory you want must be governed entirely by your requirements of the rifle. You cannot combine a good short range and long range rifle if the calibre be small. The length of ball required to make it hold its momentum for a long flight will make entirely too much drop between 80 and 150 yards, the ticklish point (not where the most game is killed), but where the most chances to kill occur, and the most misses also from undershooting and from overshooting in trying to avoid undershooting.

If you lighten the ball enough to overcome this last trouble then it will be too short range. That is, it will not have enough actual weight to hold out well to 300 yards and over.

And this is one of the reasons why I don't bow in blind adoration to the wonderful .44. I'm out of the fashion I know, but not only like the hunt to end when I get a shot instead of one-third of the time just fairly beginning. I not only like to spare noble animals useless suffering and frequent waste, but I like a good long level range with the possibilities of shooting well up to 400 yards or over if necessary. I generally use a short conical ball 1½ times the weight of the round ball with five drams of powder. This gives a better trajectory beyond 200 yards than the round ball, and under that distance is close enough to it for general shooting and is less affected by wind.

I agree with Major Merrill exactly as to the distance of shooting on game, but at the same time one should have a rifle that will perform well at double 140 yards. And to get a good 140 yard trajectory without losing it on the next 140 is the sole and only question as to the trajectory of hunting rifles. And I have found no trouble in solving it at least to my own satisfaction.

Since writing the above it has occurred to me that some will say a 16 bore gun cannot burn six drams of powder, and that it is of no advantage to be able to shoot such large charges. The answer to this is that though a less proportionate amount is burned in a large charge than in a smaller one a greater actual amount is nevertheless burned. I have never had any doubts on this point, but to settle the matter I have just tried the round ball with five drams of the same mixed powder. At 100 yards the balls dropped off an inch from the place where six drams had placed them, and at 175 yards six inches.

T. S. VAN DYKE.

WHY DID HE DO IT?

THE EXPERIENCE OF A "DITTMAR SPORTING POWDER" VICTIM.

ALTHOUGH we have had information of many serious accidents with the "Dittmar sporting powder," which occurred previous to Sept. 23 (when in consequence of the FOREST AND STREAM's explanation of the real nature of that compound its use was abandoned) we have thought that the publication of such accidents would be of little value. Were the powder still employed for sporting purposes these accidents might serve as useful examples, warning the foolhardy from risking their lives by the use of the Dittmar detonating compound. As the case now stands, to warn against the danger of that powder is to deal with a dead issue. For these reasons we have not published the circumstances of the following case, although the main facts came to our knowledge some months ago. They are now given only in response to repeated inquiries for the full circumstances and a request that they be put on record in this journal.

Briefly stated, as developed by personal investigation on our part and amply substantiated by the proper documentary proof now in our possession, the facts are as follows:

On the first day of last July a glass ball match was shot at "Buck's Hill," Summit, N. J. Among those present were E. G. Delany, Job Swain, George Sisco, C. W. Brainsted and J. Ahern. The contestants were all shooting under the same conditions of powder, shot, etc., and care was therefore taken to insure for each the proper charge. In deciding a tie it was E. G. Delany's turn to shoot. In the presence of the others Job Swain carefully measured out with a Dixon's gauge 3¼ drams of "Dittmar sporting powder," with which George Sisco loaded the gun, a muzzle loader, putting in two wads over the powder and one wad over the charge of 1¼ oz. shot. When Delany pulled the trigger the gun burst with a terrific shock which hurled Job Swain violently to the earth. The second finger of Delany's left hand was blown off at the middle joint and the first and third fingers of the same hand torn open. No one else was injured. Delany's hand—what there was left of it—was dressed by Dr. Whittingham, of Milburn, N. J. It was entirely useless for several months, and is now (March 5) at times exceedingly painful.

The powder used had been procured at the office of the Dittmar Powder Manufacturing Company, No. 24 Park Place, New York, the week before, i. e., the last week in June. It was sold in a "sealed can," the "seal" being intact until broken by Job Swain, who himself took the powder from the can when the gun was loaded. The powder was that manufactured, sold and "warranted" by the present Dittmar Powder Manufacturing Company.

The bursted gun belonged to George Sisco. In compensation for his loss occasioned by their detonating compound, the Dittmar Powder Manufacturing Company's agent, Justus Von Lengerke, gave Sisco another gun. "Why did he do it?" The Company must have known that this act was an acknowledgment that the cause of the accident was the detonation of their nitro-cellulose explosive.

The Dittmar Powder Manufacturing Company's agent, Justus Von Lengerke, also immediately after the accident sent word to the man who had been maimed by their powder that the Dittmars would pay all his expenses. "Why did he do it?" They must have known that this too, was an admission that the man, who had been crippled for life, owed his misfortune to the detonating compound which had been sold by them in a "sealed can." The reason, probably, was that the manufacturers, who were just at that time endeavoring to explain away the Nash accident down in Mississippi, thought that the best way to deal with this accident nearer home was simply to hush it up. However, the question quoted above is one which we will leave every intelligent man to answer for himself.

There is another question which is not more difficult of reply. Delany's "expenses" were to be paid by the Company. In addition to the physician's fee, the accident and consequent enforced idleness entailed a loss to Delany of several hundred dollars; but up to the present (March 5), with the exception of a letter from the Company's agent, Delany has heard nothing more from them. When their agent promised to pay the crippled man's expenses, why did he *not* do it?

HOUNDING AND STILL HUNTING

NEAR THE ADIRONDACKS, Feb. 1.

Editor Forest and Stream:

I have noticed in late issues of the FOREST AND STREAM quite a number of articles in relation to the hounding of deer in the Adirondacks, in most of which the writers are opposed to that mode of hunting, giving as the principal reasons that it is more destructive of the game than other ways of hunting them, drives them out of the country, and besides is an unsportsman-like manner of hunting. All this I claim is not the fact by any means. There are three ways of hunting the deer practiced to any extent in the Adirondacks—still hunting, hounding and floating or jack-light hunting, as we call it here. Now, any one who has ever still hunted knows that it cannot be followed to any advantage before the leaves are off the trees, which is not much, if any, before November, at a time that but few, if any, sportsmen come to the Adirondacks from the cities and large towns. At that time the sporting season is considered over by the sporting houses in this part of the country at least. But very few sportsmen come here for the purpose of still hunting at any time. In the thirty years and over I have lived near and frequented the Adirondacks, I have not known of a dozen different ones coming here from a distance to stillhunt deer, and have seldom known of any hunting being done in November, except by residents of this and adjoining counties, and a few market-hunters.

Of the two other methods of deer hunting, hounding and floating, the first is by far less destructive of the deer, will not any more tend to drive them out of the country and is a far more sportsman-like way of hunting. I was camped last season from the middle of June to the last of October on the 16-mile level of the St. Regio River, and kept a record of the number of deer killed while I was there, on the level and ponds in the vicinity. By floating in June, 17 were killed; in July, 2. By hounding in August, 4; in September, 4; in October, 4. I heard by Mr. Phelps, of the Blue Mountain House, who also kept a record, of four more being killed by hounding after I left.

In August and September quite a number of parties came here and hounded deer that did not get one, although I knew of only one case in all where the dogs did not water the deer somewhere. And I will say here that it is not by any means so easy a matter to get a deer by hounding as those who write against it would have one believe. It is seldom one gets a chance to "grab one by the tail" or "knock it in the head with a club," before it is shot, and when a party puts out the dogs in the morning they are not sure of having venison for supper by any means, as many who tried it on the 16-mile level last season season can certify. Deer have many ways of fooling both dogs and men, some of which I could give here, but space will not permit.

By hunting deer by floating, as it was practiced last season and always has been ever since I have been a frequenter of the Adirondacks, is the means of destroying half as many more at least as are killed at the time, because the fawns are left to starve when the does have been shot. I would like to ask what is more unsportsman-like than to be paddled up to within a few feet or yards of a deer and then to fire a load of buckshot into it. As likely as not it will be a doe, which is suckling a pair of twin fawns. In hounding the deer has some chance for his life, but by floating he stands watching the deceitful light, unaware of any danger until shot down in his tracks, or, as is frequently the case, wounded unto death when he will hobble back into the alder bushes and die and is left to rot or make food for wolves or foxes. I found a two-year old buck last season that had been shot and left in that way on the level.

As to driving deer out of the country by hounding, it is all bosh. I admit that where deer have been hounded in a locality for any length of time they will leave and go back into the unfrequented parts of the wilderness, but no more than they will by being fired at in floating, as by my record you will notice but two deer killed in July, although there was more hunting then than in June, when so many were killed and shot at that they all left the level. But they will always return to their old feeding grounds after a while, as they did last season—the last of August and first of September. It is for this reason of hunting deer with dogs that most of the sporting-house proprietors are so opposed to it, for when parties come near their vicinity and hunt with dogs, as they generally do the first of the hounding season, it drives the deer away from their vicinity, so that their guests don't have so good a chance to buck-shot them by floating, and but few are killed in that month, which I consider all the better for the preservation of the game. In my opinion the first of September is early enough to admit hounding deer, and floating ought to be prohibited altogether. Still hunting I believe to be the most sportsman-like manner of hunting deer; but as I have stated above, but seldom sportsmen come here at a time when it can be practised to any advantage. And, therefore, I should not think it advisable to prohibit hounding altogether.

Some may wish to know why I do not complain of those

parties who kill deer out of season. I will say here only that I have reasons that to my own mind I think sufficient, which is the same that many other residents besides myself have, who would be glad to have it stopped. In conclusion, I will say that if the present laws, with a little alteration in the time for hounding to commence, would be good enough, even allowing floating, if they could be properly enforced, and the deer would increase in the Adirondacks. And this is the opinion of fifty or more sportsmen, guides and hunters residing in this county whom I have talked with on the subject within the last six months. Although they do not all live up to it they admit it to be the fact. Their cry is "the game is going and I am bound to get my share while I can."

ADRON ONDACK.

P. S.—A lumberman here to-day, who is cutting lumber between the middle branch of the St. Regis River and Meacham Lake, tells me that as many as forty or fifty deer are feeding every night on the tree tops which are cut down during the day. The snow is about two and a half feet deep on the level. The deer come there instead of yarding. He would not admit any had been killed, but judge by his talk that the camp has a supply of venison. A. O.

The points on which the experience of deer hunters is asked are as follows:

1st. What is the character of the country referred to?

2d. What is the prevailing method of hunting deer?

3d. Describe hounding deer, as practiced in the section referred to and its effects. Does it drive deer out of the country?

4th. Describe in like manner still-hunting and its effects.

5th. What class of men kill the most deer?—market hunters or parties of sportsmen?—residents or non-residents?

6th. Would resident sportsmen approve of a law prohibiting hounding deer? Would the residents assist in enforcing it?

7th. Would they approve of a law permitting hounding, but prohibiting the killing or capturing of the deer after it has been run into the water? Would such a law be practicable?

8th. What is the open season for deer?

9th. What are the winter habits of deer, so far as you have personally observed them?

MIGRATORY QUAIL.

BOSTON, Feb. 28.

Editor Forest and Stream:

I am in receipt of advices, under date of Jan. 25, from Mr. Carl F. Braun, of Messina, Sicily, by whom most of the migratory quail that have come to this country were shipped. He requests me to make public his prices and terms for the present season, which I gladly do through your columns. Mr. Braun offers to deliver the cages of one hundred birds each on board steamer, to provide food for the voyage, to prepay the freight to New York, and to effect marine insurance against total loss, all for the price of $30 per cage of one hundred birds. He reserves, however, the right to cancel the orders and return the money in case the flight of birds during the coming season proves to be so small that he cannot execute the orders without loss to himself. Those who have received birds from Mr. Braun in previous years will bear cheerful testimony to the conscientious manner in which he performed his part of the contract, and to the excellent condition in which the birds arrived. The greatest loss that came to my notice was six from one cage; the average loss was less than three per cent., and in many cases not a single bird was lost.

The terms named by Mr. Braun are cash in advance; evidently the only terms upon which it is possible for him to deal with purchasers at such a distance. Upon the arrival of the birds they must be passed through the Custom House (duty free) and must be delivered to express companies, to be forwarded to their respective destinations. As this is a troublesome operation for parties at a distance, I will, as in former years, at the request of Mr. Braun, and in order to facilitate the importation, attend to it free of charge; and I will also receive and forward to Mr. Braun any orders and money sent to me by parties desiring to import. No orders are received excepting for full cages of one hundred birds each, and the price of large and small lots is the same, to wit, $30 for each cage. The latest time to forward an order with any possibility of having it filled is April 1; and the chances are more than even that orders received here so late as that cannot be filled.

Those desiring to order from Mr. Braun will please send to me as quickly as possible, and certainly before April 1, their orders with cash inclosed to the amount of $30 for each cage, and with full address and name of express route preferred for shipping the birds from New York. I will buy the foreign exchange and send it and the orders to Mr. Braun, after which my responsibility ends until the birds arrive in New York, when I will see that they are passed through the Custom House, and given to the express company designated by the purchaser.

As some of your readers may be interested to know how many migratory quail have already been imported. I give below the exact figures for 1879 and 1880, and figures which I believe to be correct for 1877 and 1878.

Imported in 1877, 200; 1878, 5,000; 1879, 3,046; 1880, 5,100; total, 13,346. HORACE P. TOBEY.

17 *Oliver street.*

THE PROPOSED GAME BILL.—A meeting of the Long Island Sportsmen's Association for the purpose of conferring with a committee from the New York Society for the Protection of Fish and Game was held at the rooms of the Fulton Market Fishmongers' Association, Monday, afternoon, March 7. The committee from the New York Association was composed of Hon. R. B. Roosevelt, Senator Wagstaff and Charles E. Whitehead, Esq. Mr. Roosevelt pointed out the imperfections of the bill, and offered the following suggestions: That the penalties should not be the same for unequal crimes. That the word "willful" should be stricken out of the entire bill excepting in the clause relating to trespassing. That the law on ducks be changed so that the open season commences the first of September. That the law in regard to small fish should not apply to the fisherman who catches them with rod and reel; and that all contraband game should be surrendered to the officer appointed for that purpose in twenty-four hours after it had been received, or the party having the same would be liable to prosecution. The law on summer woodcock shooting is to apply to Long Island, also the words "voluntary surrender or," have been stricken out of the bill. The above suggestions are to be placed before the special subcommittee of the Long Island Association who pass upon them subject to the approval of the New York Association.

OUR DETROIT LETTER.

IN my last preceding letter to FOREST AND STREAM I hit nearer the truth in respect of time than I anticipated in the matter of those then prospective changes in the rules governing the shoots of the Michigan State Medical Association. A meeting was held this week at which my identical prognostications were literally realized, that is to say, the handicapping experiment was abandoned by a nearly unanimous vote, the only opposition coming from Goff Stanton and J. V. D. Eldredge, both excellent shots, but somehow infatuated with the twenty-one yards range. The new rules are:

1. H. and T. plunge traps at twenty-six yards for tame birds, usual rules to govern other points.

2. English rules, twenty-six yards rise for wild birds.

This action effectually settles handicapping by this association so far as contests for its much coveted trophy are concerned. I am glad of it, and I am very sure that the association as a whole is glad of it too. It can well afford to drop everything that has the appearance of child's play, and permit its members to come to the scratch on their merits as marksmen, and not by sufferance of a too tender managing committee.

The Pacific Gun Club held its annual meeting last night and elected officers for one year as follows: President, John Demass; Vice-President, W. H. Gillman; Treasurer, John Shuton; Secretary, Lyman Brant.

This club will give a shoot so soon as the weather shall have taken a favoring turn. At present there is a complete embargo on sport. Even our usual fox-chasing has been laid on the shelf, and is snugly reposing there all because of the heavy snows which render it impossible to run dogs with anything like a compensating measure of success. Our local sportsmen are burnishing up their arms, however, preparatory to a seizure of time by the forelock when the sign is right.

Game legislation at Michigan's capital is in a reasonably satisfactory state of forwardness. There is considerable opposition to that clause of the bill prepared by the State Sportsmen's Association which prohibits duck shooting from batteries. The opposition comes from those who live near the big lakes who say that battery shooting is the only kind they can indulge in with any considerable degree of success. A committee of the association is in correspondence with Senator Gibson (who introduced the bill) advising him that there is no disposition to be tenacious about the objectionable clause if the bill can be passed and preserve intact its remaining features. G. P. G.

Detroit, March 5.

ENGLISH RABBITS FOR LONG ISLAND.

THE great prolificness and fine epicurean properties of the English as compared with the American rabbit have been the cause of many trials by American sportsmen and others to introduce it into this country, but invariably without success.

Mr. Aslin Ward, a well-known sportsman of Brooklyn, has succeeded, after much trouble and expense, in importing a number of these rabbits, and has presented them to the Southampton Sportsmen's Club, of which he is a member, to be turned out upon their preserve. By this instance of liberality Mr. Ward has not alone benefited sportsmen and the Southampton Sportsmen's Club, but the people generally, and especially the poorer classes, the increase of these rabbits being so rapid that in a very few years they will be plentiful throughout all parts of the State, and the wild lands will abound in a spontaneous production of fine meat.

The indefatigableness and efficiency of the efforts of this club in the promulgation and preservation of game deserve the encomiums not alone of the sporting fraternity but of the public generally.

During the whole of this severe winter the birds upon their preserve have been well fed and thoroughly cared for and are now all alive. NEW YORKER.

INFORMATION WANTED.

MINNESOTA SHOOTING.—C. E. W., Troy, N. Y., asks (1) where he can find best deer hunting within 150 miles of St. Paul, Minn.; wants board, preferably with some one who understands sport. (2) Resort for deer, ducks and geese in Otter Tail County, Minn., with board. (3) Sporting centre, with board, on line of St. Paul, Minneapolis and Manitoba Railroad.

BEAUFORT.—"Subscriber" asks: (1) What is the range of the thermometer at Beaufort, N. C., in winter and summer? (2) Is the climate healthy, or subject to malaria and fever and ague? (3) Is wild fowl and general shooting good in its vicinity?

TRAPPING THE CAT.—Our song and game birds have no deadlier foe than the common cat. The serpent destroys only when compelled by the pangs of hunger to seek his food. He fasts for more than half the year. The cat, cruel and cunning as the tiger, kills more than she can consume and, like the Berserkers of old, is mad with the love of slaughter. Prowling by night through forest and by stream, her path is dyed with blood. The young in the nest of the hare that escape her tiger fangs are fortunate. As a household pet she is a nuisance; as a destroyer of rats, a failure; as a companion, unsatisfactory and uninteresting, feeling but little affection for either friend or home; she is the sworn enemy of the farmer, killing the beautiful birds that are his friends and helpers; she is the unrelenting foe of the sportsman and should be hunted down and destroyed like the wolf. Almost any dog can soon be taught to chase and kill a cat; without this accomplishment he is but poorly educated.

The breech-loader can only be used effectually by daylight, or when the moonbeams are very bright; but as the cat prowls most when the nights are dark in the lonely woods, where the ruffed grouse loves to lead her young, and through the stubble fields, where the quail have their play-ground, a deadfall placed here and there along the paths is almost sure to arrest the midnight marauders. If a stream flows through the grounds, throw a tree across it and set your trap there. The cat dislikes to wet her feet and will always use the bridge. As is well known, none of the feline race can resist the odor of valerian; to all the tribe it is the elixir of life and the fountain of youth, and they will rush into any trap where it is. The skunk also loves it, and in his death agony will mingle his own perfume with it. If you set a deadfall and sprinkle under it some of the essential oil of valerian no Thomas or Tabitha passing near it will fail to enter and yield up the last one of the nine lives at the shrine of this great medicine god of the tribe. XIL YORRIS.

[Our correspondent does not tell how to take cats on fish-hooks, but it can be done, and has been done.]

PROPOSED MASSACHUSETTS LAW.

AN ACT FOR THE BETTER PROTECTION AND PRESERVATION OF BIRDS, BIRDS' EGGS, DEER AND GAME.

Be it enacted, etc.:

SECTION 1. Whoever takes or kills any woodcock or any ruffed grouse (commonly called partridge) between the first day of January and the first day of September in any year, or within said time sells, buys, has in possession or offers for sale any woodcock or ruffed grouse, whether taken or killed in this Commonwealth or elsewhere, shall, upon conviction, be punished by a fine of twenty dollars for each and every such bird.

SEC. 2. Whoever takes or kills any quail between the first day of January and the fifteenth day of October in any year or within said time sells, buys, has in possession (except alive) or offers for sale any quail, whether taken or killed in this Commonwealth or elsewhere, shall, upon conviction, be punished by a fine of twenty dollars for each and every such bird; *provided*, that any person may buy, sell or have in possession quail during the months of January, February, March and April if such quail were legally taken or killed; and in all prosecutions for the possession of quail during the four months aforesaid the burden of proof shall be upon the defendant to show that such quail were not taken or killed contrary to the provisions of this act.

SEC. 3. Whoever takes or kills any wood or summer duck, black duck or teal between the first day of May and the first day of September in any year or within said time sells, buys, has in possession or offers for sale any wood or summer duck, black duck or teal, whether taken or killed in this Commonwealth or elsewhere, shall, upon conviction, be punished by a fine of twenty dollars for each and every such bird.

SEC. 4. Whoever takes or kills any Bartramian sandpiper (commonly called called upland plover) between the first day of January and the fifteenth day of July in any year or within said time sells, buys, has in possession or offers for sale any Bartramian sandpiper, whether taken or killed in this Commonwealth or elsewhere, shall, upon conviction, be punished by a fine of ten dollars for each and every such bird.

SEC. 5. Whoever, at any season of the year, takes or kills any pinnated grouse (commonly called prairie chicken, except upon ground owned or occupied by him, and grouse placed thereon by the owner), shall, upon conviction, be punished by a fine of twenty dollars for each and every such bird.

SEC. 6. Whoever takes or kills upon their breeding ground any wild or passenger pigeon, or takes or kills any Carolina or turtle dove, herring-gull, tern, sea-swallow or mackerel-gull between the first day of May and the first day of September in any year, shall, upon conviction, be punished by a fine of ten dollars for each such offence.

SEC. 7. Whoever takes or kills at any season of the year any undomesticated birds not named in the preceding sections of this Act (except birds of prey, crows, crow-blackbirds, jays, wild geese, herons, bitterns and such fresh water or sea fowl as are not named in the preceding sections of this Act), or willfully destroys, disturbs or takes the nests or eggs of any undomesticated birds (except the nests and eggs of birds of prey, crows, crow-blackbirds and jays), shall, upon conviction, be punished by a fine of ten dollars for each such offence: *provided*, that any person above the age of sixteen years, having a certificate from the Curator of the Museum of Comparative Zoology at Cambridge, the president of the Massachusetts Agricultural College at Amherst, the Boston Society of Natural History, the Worcester Lyceum and Natural History Society, the Peabody Academy of Science at Salem or from any incorporated society of natural history or college in the State, to the effect that said person is engaged in the scientific study of ornithology or is collecting in the interests of and for said institutions or any one of them, may take the nests and eggs of, or at any season of the year take or kill any undomesticated birds; but this provision shall not apply to the birds or eggs of birds named in the first five sections of this Act during the time they are protected.

SEC. 8. Whoever, except during the months of October and November, takes or kills any deer (except his own tame deer, kept on his own grounds), shall, upon conviction, be punished by a fine of one hundred dollars for every such offence; and whoever hunts deer at any season of the year by the use or aid of dogs, shall, upon conviction, be punished by a fine of fifty dollars for every such offence; and any person may kill any dog found chasing or hunting deer.

SEC. 9. Whoever, between the first day of March and the first day of September in any year takes or kills any gray squirrel, hare or rabbit, shall, upon conviction, be punished by a fine of ten dollars for each offence.

SEC. 10. Whoever, at any season of the year, takes, kills or destroys any game bird, hare or rabbit by means of traps, snares, nets or springs; or, whoever, for the purpose of taking or killing any game bird, hare or rabbit shall construct or set any trap, snare, net or spring; or whoever takes or kills any hare or rabbit by the use or aid of any ferret, or whoever shoots at or kills any wild fowl or any game bird on the shore, marsh or beach birds with or by the use of any battery, swivel or pivot gun or by the use of any torch, jack or artificial light, shall, upon conviction, be punished by a fine of twenty dollars for each such offence:

Provided, the provisions of this section shall not apply to the trapping or snaring of ruffed grouse (commonly called partridge), hare or rabbit by any person upon his own land between the first day of September and the first day of January following; and *provided, also*, that owners of land shall not lose said rights for such purposes, nor under any circumstances allow any other person to snare or trap upon their lands.

SEC. 11. The Commissioners of Inland Fisheries shall have authority to act as game commissioners also; and their authority shall extend to the protection and preservation of game birds and animals in like manner as to fishes.

SEC. 12. Any regularly incorporated association for the protection of fish and game within this State may appoint, with the approval of the governor and council, one or more persons for each county of this Commonwealth, to act as fish and game constables. Such officers shall have authority to enforce any and all provisions of acts relating to the protection and preservation of fish and game within this Commonwealth, and shall serve without expense to county or State.

SEC. 13. It shall be the duty of every officer qualified to serve criminal processes, including the officers who may be appointed under the provisions of this Act, to arrest without warrant any person whom they shall find violating any of the provisions of this Act and bring such offender before the nearest magistrate. Any officer neglecting or refusing diligently to enforce the provisions of this Act, upon proper information and complaint, shall be punished by a fine or imprisonment, or both.

SEC. 14. Any justice or magistrate, on receiving proof or having reasonable cause for believing in the concealment of any game mentioned in this Act during the time possession of such game is prohibited, shall issue his search warrant and cause search to be made in any house, market or other building, or in any boat, car or vehicle of any description whatever; and for that end may cause any apartment, chest, locker, box, crate, basket or package of whatever description to be broken open and the contents examined.

SEC. 15. All fines accruing under this Act shall be paid one-half to the complainant and one-half to the city or town wherein the offence is committed.

SEC. 16. Chapter 209 of the Acts of the year eighteen hundred and seventy-nine, and all Acts or parts of Acts inconsistent herewith are hereby repealed.

A DUCK BRIDLE.—Port Royal, S. C., Feb. 14.—I inclose you a "duck bridle." No man knowing the intelligence of the wild duck will shoot over dead decoys. With the old poodle duck, muddy gray, and the green-headed drake, "mallards" bridled, placed as decoys, you can kill all the ducks you want. Take up the ducks by the two wings, as you would carry live ducks, place both wings through the slit, one part going behind the wings, the other in front of

the wings; bring the two eyelet holes together, make the cord fast, attach a weight (sinker) and throw out the sinkers far enough apart to keep the ducks separate. As soon as they are in the water they will commence washing and playing. You can sleep in your blind, for as far as the eye can reach they will see ducks on the wing and will call them—the she one with a loud quack! quack! quack! the drake will do the same. Moored, as they will be by this means, they ride like a boat breasting the sea, and they will live through any sea. Secured by the foot, they will drown in five minutes. I invented the duck bridle; use it for the benefit of sportsmen.—J. E. J.

[The bridle sent by our correspondent is a bit of canvas one inch wide and fourteen inches long, with eyelet in each end and a slit six inches long in the centre.]

DEER KILLED WITH NO. 10 SHOT—Tara, Iowa, Feb 27.—In your issue of Feb. 17 I see that Mr. G. L. Appleton, of Bryan County, Georgia, tells of killing a deer on the run with No. 9 shot. I spent the winter of 1879-80 in Marion County, Florida. A gentleman from Connecticut also passed a portion of the winter in the same vicinity. One morning, while walking in the woods, I heard a shot near me and soon the Connecticut gentleman appeared with his gun in his hands. He said that he had just jumped a deer in some palmetto scrub and had broken her right hind leg with a charge of No. 10 shot. She got up about twenty feet from him. He then fired his left barrel at her body; this was also No 10. She, however, got away. A few days afterward we passed near the same spot and found the deer, dead. She had got out of his sight in the thick scrub and he had not gone after her, as he supposed that his shot was too small to have killed her. H. R. E.

AUXILIARY BARREL—Bellville, O.—I purchased one of Shelton's auxiliary rifles some months ago, with which I have done some excellent shooting up to three hundred yards, which is as far as I have tried it. Having failed to find a rear sight that would give good satisfaction in thick timber I have a sort of a peep sight which I made myself, but do not think that it would do for game as well as an open or sporting sight. Probably some one can give us some new ideas or experience in the matter. The winter has been so severe here that quail shooting next fall will not be very profitable. I knew of half a dozen coveys last fall, but it is impossible to find a single bird. Ruffed grouse seem to have stood the storms exceedingly well; plenty of squirrels and rabbits.—W. S. C.

GOOD RECORDS.—Pittsburg, Pa., has a very large and active sportsmen's association; and is a centre for sporting matters. Among other evidences of this fact is the large sporting goods establishment of Messrs. J. Palmer O'Neil & Co., who are displaying most commendable enterprise in providing for the demands of their trade. Mr. O'Neil not only knows what a good gun is, but understands as well how to use it. As a proof both of the excellence of the gun and the skill of the man, we refer our readers to the scores published elsewhere, which were made with the Westley Richards hammerless gun. The gun, the man and the firm have good records.

THE NOROMBEGA SPORTSMEN'S CLUB, of Bangor, Me., held their annual meeting February 23, and elected the following officers for the coming year: President, John P. Tucker; Vice-President, H. N. Fairbanks; Secretary, Charles York; Treasurer, Fred T. Hall. Executive Committee—John P. Tucker, Charles York, Fred T. Hall, H. W. Durgin, G. A. Abbott. The club is prospering and in good financial standing. We have twenty-four members and some applications for membership now of good men. We propose to see the game laws of the State carried out to the letter. BANGOR.

THE BRIDGEPORT GUN CLUB re-organized Feb. 1, 1881, formerly the North End Club. The law, as it now stands, prohibits pigeon shooting in Connecticut; but a bill is now before the Legislature which will repeal it. If repealed, a three days' tournament will be inaugurated, under the auspices of the club, to come off some time in the spring. A drag fox hunt will also take place on each day of the tournament. The tournament will take place at Sherwood Park. Officers: President, Charles Greather; Vice-President, James Scott; Secretary, F. Symington; Treasurer, John White.

THE KENNEDY RIFLE has of late won many friends because of its excellent performances. The weapon is manufactured by the well-known Whitney Arms Co., of New Haven, Conn., and the makers are among the men of the day who believe in building up a reputation for their rifle by its own record and merits. Those who are not familiar with the Kennedy rifle will do well to send to the manufacturers for a description of it.

PROF. HALL'S GUN.—Prof. Wm. B. Hall, of Indiana, Pa., is to be congratulated upon the recovery of his valuable gun, the theft of which was noted by us some time ago.

ARCHERY.—The Executive Committee of the National Archery Association of the United States is now in session at the office of the Corresponding Secretary, Mr G. F. E. Pearsall, No. 298 Fulton street, Brooklyn, prepared to receive application from archery clubs in any State of the Union for admission into the National Association. As the grand annual meeting of the National will be held in Prospect Park, Brooklyn, during the second week of July, at which none but members of the National Clubs will be allowed to compete, it is advisable that applications for membership be made immediately to the Corresponding Secretary, who will afford all necessary information, with copies of the constitution, by-laws, etc.

We have received a copy of what is perhaps the smallest newspaper published in the world. It is the *School News*, edited by a Pawnee boy, who is one of the pupils at the Indian school, Carlisle, Pa., and the pages—there are four of them—measure four inches by three inches. The editor advises his subscribers to keep their undershirts on and to study hard. Napoleon is said to have feared a newspaper much more than a hostile army; if the young Carlisle editor learns his business he may yet play an important part in solving the Indian question.

THE FOREMOST NAME in the retail clothing trade is that of Baldwin, the Clothier. He has the largest establishment in New York and only one branch store—"Baldwin Building," Brooklyn.

TROUTING ON THE UNKNOWN.

"LIVES there a man with soul so dead" that has not somewhere way over the hills and down into the valley a choice little bit of woodcock cover that nobody else in all this world knows of, or some trout brook hidden in the depths of the forest, where no one drops a worm or casts a fly but he to whom alone the brook is known?

The woodcock cover may be shot over by a dozen others, who each cherish the same delusion, still you hug the fond fancy to your breast that you alone pull trigger there, and that for you the brown cock wait in sweet anticipation of being shot exclusively by yourself.

The trout stream may be fished by half the urchins in town; you won't believe it, but stealthily take a devious path through the woods to reach the sanctuary, known to none other among the sons of men.

Away in the vast forests of the North I know a lake, walled in by virgin hills, flooded with the sunshine of summer. Down through the woods a foaming river pours its swift current into the lake. There leap the great red trout; there you hear the partridge drum as you cast the fly, and there the caribou looks curiously at you from out the thickets.

Where is that river? Alas! my friend, for you it is nowhere; it is Utopia; it is the great Unknown to all the world besides, for I alone know of its existence. It is my sanctuary. And I am sure I cannot disclose it to you until at least you tell me truly the exact locality of that new alder run where you shot a dozen cock one afternoon last fall, where no one else ever shot a cock before. But I will tell you of a day's fishing I once had on the Unknown.

We pushed out upon the lake at "5 o'clock in the morning," just as the bell on the little frontier church was ringing matins. Our boat was a light cedar, lap-streak canoe, twenty-three feet long My guides, Jim and George, pulled a leisurely stroke, while I trawled with two light rods from the stern.

I soon reeled off a long line from each rod. On one line I trolled a cast of three brilliant flies; on the other an enormous trolling fly, with yellow body and red wings.

Out upon the great lake we rowed. The only ripples that broke the surface came from our boat and reached away toward the receding shore in long, diverging lines. The lake was yet asleep in the lap of her wooded hills, the morning sun shone brighly from a clear, blue sky; a great quiet filled the air, broken only by the distant dying peal of the church bell calling to early mass. It was

The rarest thing of all the year—
A perfect day in June.

Ah! there's a rise—a tug on the line, the swift click of the reel and a swirl in the smooth water a hundred feet astern.

How it thrills one to be among the trout again. The little fellow fights gamily as I reel him in. Ziz-zag he rushes with the line and gives a pretty curve to my nine-ounce pliant rod of toughest greenheart. In he comes, the first trout, with more pluck than weight, for he falls two ounces short of a pound.

Three miles across the lake we pull. As we near the farther shore there comes a sharp jerk on the trolling fly. My larger rod, of eleven ounces, buckles to the strain. I pass my disengaged rod to George, who reels in the line out of the way, and, standing up, I fight a large, determined fish. He seeks the bottom; the rod bends so sharply I am forced to give him line. Now he slacks and I eagerly reel in great lengths of the silken cord. He shoots under the boat. Why will trout be so disagreeable? What an awkward bend it gives your rod and what a miserable strain it puts upon it to have a big fish run under the boat, double up your little strip of wood, bring the tip to the water's edge and then tug, tug, tug, like the extra leader on an overcrowded horse-car stuck on a slippery, uphill grade! But now he gives a swoop out from under the stern and breaks water for the first time, flinging himself into air, shaking the drops from him. "A beauty, boys, a beauty!"

The tip of the rod drops a bit, the hook does not tear out and the big trout falls into the lake with the hook still fast. Again and again he leaps into air, then seeks the depths once more, but this time so feebly that I snub him short, then reel him to the surface. A few faint rushes. Ah! he lies over on his side. What a picture on the surface of the water, his side all mottled with gold, gleaming with crimson points, his white throat and his red-tipped fins!

But it won't do to stop and admire till he gets his second wind. Jim stands ready in the bows with the edge of the landing-net just dipping in the water. Smoothly I slide my prey along the crystal surface of the lake, Jim gives a sudden dip with the net and aboard flops master trout. Placed on the steelyards he weighs down just two pounds and three ounces. It is wonderful how the simple act of carrying scales with you reduces the weight of trout. Now, my guides and I would all have sworn this trout weighed seven pounds at the least calculation had he broken away.

Having landed him, had we only fortunately forgotten our steelyards we should have taken our solemn oaths that he was a five-pounder, but with that miserable little exact contrivance for reducing the weight of trout we find his weight to be just two pounds and three ounces. "You'd better take river weight," once said an old guide to me. "What's river weight?" quoth I.

"Oh, that's what we guides set the fish at without weighing 'em. It's always much more satisfactory to gentlemen, sir."

But I took my scales along, weighed every fish and entered the weight in my note-book. There were no five-pounders that the guide had promised me. At last he took up my steelyards with a contemptuous sneer, and looking straight at me, said, oracularly, "You'll never catch a big fish as long as you carry that d—d thing along with yer."

True enough; I have always carried that d—d thing along with me, and I have never caught one-half the big trout that most of my brother piscators who take river weight are ready to swear to.

"Show me a gunner and I'll show you a liar," was one of glorious Cale Loring's brevities. Ah, me! must we also include fishermen. But my guides are pulling up the lake, my lines are scarcely reeled out before I get a strike on my little rod, and after fine sport bring to basket a trout of a pound and three quarters.

We hear a gurgling sound; a little rill stealthily creeps out of the forest and trickles into the lake; Jim and George rest on their oars, and reeling in my line to twenty feet I make a cast and drop three flies fluttering down through the air to the margin of the lake just where the brooklet ripples in. Jove, how the little trout leap for the gaudy deceits, I hook and land one of three quarters of a pound, then another the same weight, then three more weighing, respectively, a half pound, six and five ounces.

The trout were still jumping in expectation of more flies, but the catch was getting too small, so we pulled away and soon reached the mouth of the Unknown River. Here I took the middle of our cedar canoe, and reeled in and stowed away my larger rod. Jim stepped into the stern, then the guides, taking their iron-tipped setting poles, forced the canoe steadily up the foaming rapids of the Unknown. Here we caught a few half-pounders; next we paddled through two miles of dead water with never a rise. Now, we come to a deep, broad, still pool. Great ash trees lean far out over the water. Jim and George cease paddling. Stealthily the canoe forges ahead with its old momentum.

I swing my rod back, and with the most gingerly turn of the wrist of which I am capable shoot my choicest cast of flies out into the air, then let them drop like fluttering butterflies upon the smooth surface of the pool. At the first cast a ruddy trout jumped perpendicularly clear of the water, missed the fly and dropped back stiff as a stick. At the second cast I hooked him—a pounder

Next a bigger fellow rose to the lure. He weighed a pound and a half. Then a monster swirled up and quietly took the fly, but as he was fat and lazy, Jim soon netted him—a very handsome fish weighing full two pounds and a half.

It is true that one needs to be very quiet and circumspect in trout-fishing; yet it is equally true—and this I did not find out for years—that in a large pool it is not well to anchor your craft or cast all the time from one spot, even if that spot commands the whole pool.

I fancy that the trout, after a while, get accustomed to seeing the flies drop in the same way and pulled everlastingly in the same direction or toward the same point and so get educated up to your little game. Or perhaps trout need to be stirred up a bit to give the quickest sport, and a boat moving slowly and quietly around a pool, with an almost imperceptible dip of the paddle, may stir them up just enough, without frightening them.

That a canoe and paddle do not always scare the trout I know full well. Indeed, I think the reason so many trout, when hooked, run under the canoe is because they mistake it for a log and seek shelter beneath it.

An old trapper told me that once when propelling his canoe with a red paddle slowly across a remote lake a large trout shot up from astern and bit his paddle as it quietly moved through the still water.

So after landing the three trout we paddled cautiously around the pool. Now a ruddy hero catches the fly and bravely fights; run after run he gives. The sharp click of the reel makes sweetest music as the line whizzes out. But Jim's landing-net stands ready and open like the doom of fate and gathers him in. The fish weighs two pounds six ounces, but he was a male, and these fight hardest. Another rose; he weighed one pound ten ounces. Then, as we slowly moved about the pool, a grand old red-bellied male broke water and took the fly in air. What sport he gave! lashing the pool with his tail, swirling around, the tight gut cutting the water with a twang like the string of a violin, then diving to the bottom, bending the little rod to a keen tension, almost to breaking. Jim landed him at last and he brought down the scales to two pounds and ten ounces, but the scales did not do him justice. Nothing but river weight meets the requirements of such a plucky trout as this.

We had taken six trout from this one pool in less than half an hour, each weighing a pound or more and the six weighing eleven pounds and three-quarters. May this pool forever be unknown. We paddled on. Just above in a whirling rapid we basketed a trout of two pounds and two ounces. At the first catch after landing him a dappled monster took the fly, cut across the rapids from shore to shore and fought me on every inch of line I reeled in. He was the biggest trout yet. How anxiously I watched the scales as the great fellow hung pendant. Why didn't he pull them down to three pounds! "Hold on! hold on!" I cried to Jim, who held him, for the trout flapped his tail and the index on the scales seemed to move down a bit. But it was no use. No friendly hand was near to drop a charge of shot into the trout's gullet or stuff a stone into his jaws, so the scales remained inexorably at two pounds and thirteen ounces.

But our sport here was not ended, for in the rapids we took two more which weighed two pounds seven ounces and two pounds one ounce respectively. Then we poled on, catching a trout wherever we chose to whip the stream

Soon we hear a dull, distant roar that grows louder and louder as we pole up the rapid river. Rounding a bend we catch sight of a white wall of foam stretching across the stream from bank to bank. These are the Unknown falls. The wide river pours over a ledge of rock and tumbles down a rocky incline for thirty feet or more. The whole fall is not more than ten feet vertically, but the rapid water is dashed into foam, and the white, tumbling line forms a pretty contrast with the dark pool beneath and the high, green woods on either bank. At the foot of the falls we land for dinner.

I count the trout; there are thirty. The twelve largest weigh twenty-five pounds and two ounces. I lay out these dozen two-pounders in a row in the bottom of the canoe and a pretty sight they were as a fisherman may care to see. Two red-bellied, big-headed males had a whopper-jawed, horny beak projecting upwards from the point of their jaws which fitted into a groove at the end of their noses when their mouths were shut.

Meanwhile George had built a fire, hung the kettle and got ready the frying-pan. Jim lays violent hands and a sharp knife on one of my two-pound pets. The frying-pan sizzles and sputters, and fragrant odors are wafted from the tea-kettle. Soon, sitting on the bank under the shade of the forest looking out on the foaming falls, we ate a royal woodland meal.

After dinner I tried the fly at the foot of the falls. I hooked a very lively fish, that gave great play in the broken water, and ran out more line than any trout of the day. Brought in at last by Jim's inevitable net; he proved to be an even two-pounder. Quickly I catch thirteen little fellows in the spray of the falls. Then the guides set me ashore and I

walk on along an old portage through the woods with a pistol cocked in my right hand ready for prowling bear or startled moose.

But no living thing appears. After walking half a mile, and passing over a little hill crest, I catch sight of bright water through the vista of the path, and soon am standing on a pretty bluff overlooking another woodland lake. To my left is the rapid forming Unknown River, the outlet of this second lake. I hear a shout, then the regular click of the setting poles as their iron ferrules strike against the rocky bottom; then the canoe appears round a projecting point, bravely forced up stream against the foaming torrent. George and Jim, bare headed, reeking with sweat, briskly ply their poles, and the canoe shoots up and on to the still beach at my feet. A hard time the boys have had of it. 'Twas well I lightened their task by walking the portage.

We pitch our tent on the bluff overlooking the lake, and as George gets ready for supper and cuts boughs for our bed I push out with Jim in the skiff. It is a great comfort to have two guides, for while one is at work you are not compelled to wait and loaf round and watch each slice of salt pork as it is put into the frying-pan and wonder if on the whole the cook is really neat and truly good, and when will that supper be ready anyway, but off you shoot with your second guide, and the time glides by as quickly as the swift flowing river till you hear the call for supper from the shore.

Where the lake drains into the river, and the low, quickening current glides smoothly like bent glass toward the foaming rapids, there lie the big trout behind great submerged boulders along the river bottom. Reeling off a long line I deftly cast my flies across the stream. Jump, jump, jump, leap the trout. A taut line, a quick turn of the wrist and I hook them all three. Wish! whirr! How they buckle and twist the little red snag on my line, and reel off fathoms at a plunge. The middle fish breaks away. Jim picks off the little trout on the dropper with his hands, and then we make short work with the two-pounder on the leader. So near the camp are we fishing that Jim flings our last capture over the bushes to George for our supper.

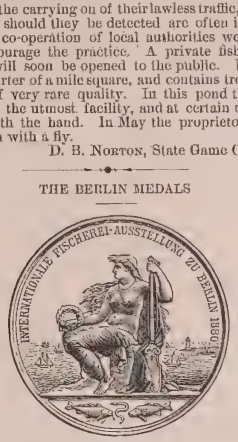
We take five more trout at the outlet, then pull ashore in the twilight. How brightly glows the camp fire! What great shadows the cook casts against the trees as he flits about the flames! How cozy looks the little tent illumined by the blaze—white canvas above and pliant green boughs beneath, and what a jolly supper we eat as darkness closes around us! Then taking out my note-book I reckon up my booty for the day. I reckoned up for my own satisfaction. I surely take no pleasure in deceiving myself, and though this is a fish story, it is also the exact truth.

The figures in my note book are as follows: June 18, 1878, took with fly 15 trout, one pound and over; weight of same 31 pounds 9 ounces; 36 trout less than a pound; weight of same, 19 pounds—51 trout. Total, 50 pounds 9 ounces

As I lie back on the boughs of the open tent, slippers off and feet toasting at the log fire, the full moon rises round and red over the wooded hills and looked us full in the face. I fall asleep content. MARSTRAND.

PARLOR AQUARIA.—These household ornaments are not as common as they should be in order to interest the children in the habits of aquatic life, either marine or fluviatile. We recently dropped into Greenwood's Aquaria depot, 41 College Place, New York, to purchase some nest-breeding stickle-backs for our little tank, but the cold weather had prevented their capture. Here we saw tanks of all sizes down to tiny globes, plants and all the appliances of the aquarian lover. Upon inquiry for some short practical rules for regulating the plant and animal life, we received the following: "A small dip net should be at hand for the purpose of extracting or putting subjects in the tank. The hand should never be used for this purpose. Always keep the aquarium where it will have plenty of light, otherwise it will be impossible to succeed with it. Water-plants require as much light as garden or green-house plants; also keep in as cool a position as possible, and above all things, do not overstock it; two small fish to one gallon of water would be sufficient in warm weather, but in cold weather the number may be increased a little. Avoid all kinds of sea-shells and corals, as they contain lime and are injurious both to animal and vegetable life."

THE BANDED PICKEREL.—It will be remembered that some two or three years ago Judge Potter planted in various parts of the lake the fry of the land locked salmon (*Salmo sebago*). Much interest has been felt among amateur and professional fishermen as to the result of this experiment, and the water has been carefully watched to see whether the young strangers have succeeded in escaping the numerous dangers that environ them. The fishermen in Maumee Bay have several times recently reported the capture of what they supposed to be young salmon, but as they had never seen the genuine nothing positive was known on the subject. The latest specimen, taken a day or two ago, was brought to Mr. C. O. Brigham by his request, and by him referred to Judge Potter. The Judge decides that the fish is the banded or trout pickerel, or in scientific nomenclature the *Esox americanus*, or otherwise the *Esox niger*, or black pickerel. The judge states that this fish is extremely rare, and that the specimen in question is the second he has ever seen. The banded pickerel seldom exceeds a foot in length, but is very graceful and symmetrical in shape, with the head of the larger members of the pike family. It usually lies close to the bottom of the water, for which reason it is sometimes called the mud pickerel, and when it takes the hook circles about, affording little sport as a game fish.



Although in this case the supposed salmon proved bogus, it is interesting to learn that the fishermen at Pleasants Bay near Monroe have taken several of the true salmon in their nets. These were about eighteen inches in length and seemed to be thriving and successfully making their way in the watery world.—*Toledo (Ohio) Telegram.*

This little nuisance is fortunately rare in Ohio waters, but is painfully frequent in the trout streams of Long Island.

POACHING THE FISH—Ithaca, N. Y.—For some time past the local authorities of Springport, situated near the foot of Cayuga Lake, have been in a furor over the lawless raids made by unknown parties upon their fisheries. All attempts to check it seemed useless so well did the fish pirates cover up their tracks, and conceal all evidence of their methods. The matter being brought to my notice I went there, and after the most diligent reconnoitering—for the ice was then five to six inches thick—I succeeded in raising several nets which were set with the stakes chopped off below the ice in such a manner that only those who knew their exact location could discover them. The offenders have not been captured yet, but I have obtained evidence sufficient to warrant several arrests, which I am about to make in a few days. The fisheries there are well supplied with trout, and no doubt the pirates would have had a rich harvest but for the timely interruption of their plans. On Owasco Lake similar attempts have been made, but receiving timely notice, I have to a great extent, if not entirely, prevented them. The offenders are desperate and cunning, and have recourse to the most subtle and daring schemes for the carrying on of their lawless traffic, and threats of vengeance should they be detected are often indulged in; but with the co-operation of local authorities we hope to be able to discourage the practice. A private fish pond near Springport will soon be opened to the public. It covers an area of a quarter of a mile square, and contains trout in abundance and of very rare quality. In this pond they may be caught with the utmost facility, and at certain outlets even picked up with the hand. In May the proprietor will allow people to fish with a fly.

D. B. NORTON, State Game Constable.

THE BERLIN MEDALS

The medals awarded at the International Fishery Exhibition at Berlin have not yet arrived, but may be expected soon. We present our readers with a picture of the medal, which will be the same whether of gold, silver or bronze. We can furnish electrotypes of these cuts if desired.

THE COD FISHERIES.—The use of the gill net for cod, which, though long practiced by the fishermen of Norway, has lately been tried here, at the request of Prof. Baird, who scans the implements in use by the fishermen of all countries to find the best methods, is fast coming into favor. The recent letter from Capt. J. W. Collins, the expert fishermen of the U. S. F. C., in our columns has familiarized our readers with its value. The Cape Ann *Advertiser*, in speaking of the introduction of new methods and the prejudice against them, says: "Now cod-nets have come upon the scene, and the trawlers are claiming that the nets drift down upon their tackle and cause them inconvenience and loss. But nets are fast winning their way into public favor and the indications are that the many-hooked trawl will take a back seat, and bait-bills be unknown."

In another article the *Advertiser* alleges that Prof. Baird is said to be "of the opinion that the only retributive remedy we can apply to Canada for cheating us in the fish question is to refuse to admit Canadian fish to our markets free of duty after the expiration of the treaty in 1885. He suggests that we impose a heavy tax on fish imported from the Dominion as soon as we can do so without violating the treaty. A retaliation by the Canadians in the form of the exclusion of our fishermen from waters within the three-mile limit will not, he thinks, be a serious matter. Our fishing craft seldom go within the three-mile limit, except to get bait, and the use of the gill net will make bait unnecessary."

In speaking of the cod fisheries, the Boston *Herald* says: "If Prof. Baird's colony of cods and other good fish out on the edge of the Gulf stream pans out all right then Gloucester can tell Canada to keep her foggy old banks to herself and be blessed therewith. Fishing on the edge of the Gulf stream would be a good deal more comfortable than on the chilly banks of Newfoundland."

SIZE OF TROUT—New York, Feb. 28.—In reply to Mr. Van Siclen's query in yours of 24th, I would say that the limitation in the weight of trout allowed to be taken by the proposed game law to a quarter pound was fixed by the joint committee who had the matter in charge. My proposition was a limit of eight inches—in a weight of probably one-eighth of a pound. For many years I have persisted in returning to the water all trout under eight inches long—result (frequently), return home with a very poor score. But, if some concert and law are not adopted the result will soon be no score at all.—MANHATTAN.

"BODINES."—Now that the tramping, trouting and camping season is coming on, books on the subject are in order. "Bodines, or Camping on the Lycoming," is a volume which every angler ought to read. It is a good camp companion. Next to a trouting jaunt with its author is the reading of his description of how he and his friends found pleasure and profit along the Pennsylvania trout streams. The book may be ordered through us at the regular publisher's price, $1 50 per copy.

HABITS OF THE GAR-PIKE AND DOGFISH—Chicago, Feb. 5.—Do the gar-pike (*Lepidosteus*) and dogfish (*Amia*) hibernate? In summer they cannot long remain without air. In winter our inland lakes are entirely closed by ice, so that no air is accessible to them. How, then, do they exist through the long winters, unless upon the theory of hibernation? I do not see the above question answered in any work on zoology within my reach. A. M. WRIGHT.

FLY FISHING IN JAPAN.—At the International Fishery Exhibition in Berlin there were artificial flies shown in the Japanese department. They were principally palmers with a gilded head, and we were informed by the Japanese Commissioner, Mr. Matsubara, that they were used to a limited extent by the gentlemen anglers of that country. Very good rods of bamboo and both silk and hair lines were exhibited, showing that the gentle art has its votaries in Japan.

THE FLY-CASTING TOURNAMENT.—S. W. Goodridge, rod maker, Grafton, Vt., offers a rod as follows: "I am glad you are going to make something more than a mere side show out of the fly-casting this year. Put me down for a bass rod, one of Dr. Henshall's pattern, for throwing the minnow, just such a one as the doctor approves."

Fish Culture.

FISH CULTURE AND FISH LAWS.

[Report of the Committee on Fish Laws, presented at the Convention of the Michigan Sportsmen's Association.]

AS chairman of the committee on "fish laws, including propagation as well as protection," I beg to report that the committee have done nothing as to practical results; but at a meeting of the committee recently held at Detroit, at which meeting Mr. Portman and myself were present (Mr. Fitzhugh being unable to attend), it was arranged that Mr. Portman should prepare a paper to be read at the Association, giving his views in reference to the needed legislation for the protection and propagation of the food fishes of the inland waters of the State; while I would direct my attention more especially to the legislation needed for the protection and increase of the supply of the valuable food fishes of the great lakes.

My remarks then will be understood as having reference only to the great lakes

I shall beg your indulgence but for a few moments, as my views as to the necessary steps to be taken to secure an almost unlimited supply of fish food can be briefly stated. That an inexhaustible supply of the valuable food fishes is a "consummation devoutly to be wished," none will deny.

But the question, as the means to be employed to accomplish the desired end, is as perplexing as it is important.

Five years since it might have been said that "something must be done not only to secure an increase, but to prevent a decrease of this food supply, which the statistics of the past decade will abundantly prove." The same assertion will, to a certain extent hold true to-day, and although active measures have, since that time been taken to avert the evil, additional measures should, I think, be inaugurated.

But it occurs to me that, at present, the most important step to be taken in the solution of the problem, after the conclusion is reached that laws are essential, is to ascertain whether the supreme control of the fishing interests of the common waters of the United States rests with the States bordering on such waters or with the general government.

However, as before stated, this step should be prefaced by evidence of the necessity for laws and the discussion of this evidence will necessarily involve discussions of some of the remedies suggested by those in favor of laws. Let us first determine that laws are desirable in the premises.

Must legislative aid be invoked to assist in perpetuating this food supply?

As the matter now stands, no laws, either State or national, that I am aware of, are in effective operation, regulating the fishing industry of the great lakes. True, the States and general government are doing a munificent work in the way of propagation, and should this beneficial support be unlimited, and continued indefinitely, the problem would be solved; but these donations are an "unknown quantity," and may be "plus or minus."

The laws framed for purpose of inaugurating relief and infusing new vitality into the languishing fishing interests contain no provisions of a compulsory nature as regards propagation, and therefore State and national aid in this respect is gratuitous, uncertain and liable at any time to be withheld. The life, growth, or future of this important industry should not hinge upon the uncertainty of legislative or congressional appropriations, but should, as far as practical, be independent and self-sustaining. Nor should we exact or expect to much aid from this direction.

No amount of sophistry can conceal the fact that the class of people most benefited by the results of propagation are those engaged in the occupation of fishing; and therefore they should, in simple justice, contribute to the maintenance of the source of their occupation and income.

But this can be regulated only by law, and we want a law that contains within itself ample provisions for its enforcement. Again, the magnitude of the interests involved is, of itself, a complete argument that a system of laws should be enacted, regulating these interests. I ask any gentleman present to name an industry of equal proportions that is so much neglected in this respect. It is, indeed, strange that in this great land of ours, with its numerous laws for the protection of property and the redress of grievances, that the fishing interests of the great lakes, representing as it does, a capital reaching into the millions, it seems strange, I say, that this vast interest should be practically without any legislature control of regulation. Such, however, is the case.

And it must be patent to the most casual observer that this important commercial industry is, at present, but a suggestion of the gigantic proportions it may attain, if fostered and encouraged by judicious, efficient and enforced laws combining protection and propagation.

In view of these grand possibilities need the question be asked, are fish laws necessary?

There is a law, the law of custom, which in some sections is observed, and which, so far as it is observed, regulates the rights of certain individuals to certain fishing grounds.

The States, too, have passed some laws affecting the interests in question, but from the want of enforcement are practically of no value; and until it is decided that they have supreme jurisdiction in the premises it is useless for them to attempt to adjust this complicated question. Perhaps it is not within the domain of the States to legislate or control the fishing interests of the common waters of the United States, and therefore it is folly for the lawmakers of this or any other State to enact measures which may not be within their jurisdiction to enforce. This is, at present, the most important question to be determined.

It is folly to offer resolutions, to sign and present petitions and memorials to our Legislature for the enactment of laws which, when passed, may be rendered powerless by a single Supreme Court decision. All our labor would then be in vain and our efforts neutralized. These things are, under the circumstances, of secondary moment.

But the question of jurisdiction stands out conspicuously as the one that should pre-eminently command our attention.

The discussions of the measures to be incorporated in fish laws can be left for the future. It is enough for the present to take the necessary steps to find wherein the control of the interests in question rests, and this is of primary importance.

We want fish laws, but we want them enacted by that power, be it State or national, whose authority shall be supreme and whose decisions shall be final. In this connection I desire to read a letter from Professor Baird in relation to this subject. I had previously written him for an expression of his views as to the question of jurisdiction:

"WASHINGTON, D. C., Jan. 17, 1881.

DEAR MR. CLARKE: The question as to whether legislation for the protection of fisheries of the great lakes and of the ocean should be enacted by the general government or the States is a

constitutional one, which I am not competent to decide. The only power to determine this is the Supreme Court of the United States; and it will demand a case to be made up and brought before the court in order to have it decided. So far as the international fisheries are concerned the United States has the power, but I doubt very much whether, even should the Constitution warrant it, Congress would take the responsibility of legislating in regard to home interests. I do not see why State legislation cannot be made efficient. I think that the provisions of the law that I suggest in my first report for the regulation of traps and pounds, more particularly in New England, could be made serviceable under other circumstances. The State should first declare its jurisdiction over the localities where the pounds or gill-nets are located and grant a license to the occupant for the time to prosecute the fisheries, conditional upon obeying the laws on the subject. Let one of the penalties of the law be the forfeiture of the right, and the giving of it to the person who furnishes information of the violation. This, with a fine and confiscation of the property, will be sufficiently severe for the purpose and one that would induce all kinds of people to be on the lookout for a chance to report to the authorities. Should any one be aggrieved by such action and carry the case to the Supreme Court of the United States, we shall then have the desired opportunity of settling the question. Yours truly,

S. F. BAIRD."

I desire further to read from the report of the United States Fish Commissioner for the years 1871 and 1872, as follows:

"In view of all these considerations, I have drafted a bill, which has been presented to the consideration of the commissioners of several States, and to several eminent lawyers, well versed in the local laws of their respective States and corrected to their satisfaction. A copy of this bill, as finally modified, is given on page 132. I sincerely trust that this, or a somewhat similar bill, may become a law in the States of Rhode Island, Massachusetts, Connecticut and New York, as I am satisfied it would be for their benefit. Although there is no serious question as to the right of the general government to make enactments as to the common waters of the United States, it is possible that any attempt on its part, at the present time, to pass this law would meet with considerable opposition; and it would be extremely difficult for the United States to enforce any special requirement or penalty connected with a close season.

"The plan of licensing the pounds, so as to give the State more efficient control, is considered one of great importance and will, I believe, be acceptable to the owners of these establishments, as it would give them a security against interference from other parties that they do not at present possess.

"The penalty attached to fishing without a license, and the ability of a State the more readily to punish an offender by depriving him of his permission to fish, will render parties careful how they offend; and by giving to the informer, in consequence of whose complaint the license is withdrawn, the first choice of taking the station forfeited, an intense vigilance will be induced on the part of those who may desire to secure a favorite location and thus supersede the necessity of an expensive surveillance on the part of the State.

"In the event, however, of the refusal of the States mentioned to establish the very limited close time suggested, I would recommend the passage by the United States of a law," etc., etc.

And again from the same authority, report of 1877, as follows:

"A very large part of the correspondence of the commission is connected with inquiries relating to the jurisdiction of the United States and of the States over the fishing grounds, and the methods by which all parties can secure their rights. * * * *

"The question as to who possesses jurisdiction over the fisheries proper along the coast of the United States and in the navigable waters is yet unsettled. At present, the United States does not exercise any, but leaves to the States the enactment of laws on that subject. Some fishermen, aggrieved by the burden of State legislation, threaten to appeal to the Supreme Court for the decision of the question; and it is much to be hoped that before long a test case may be established, so that persons interested may know whether to appeal for protection and relief to the States, or to the general government. * * * * *

"Of course, so far as the setting of traps or pounds obstructs navigation, it is clear that the authorities of the United States have power to remove these or to require them to be removed under severe penalties; but so far as special question has been made as to fishing where the interests of navigation are not concerned.

"Legislation in the United States is being continually invoked for the removal of fish pounds and weirs, and in certain areas at the head of Buzzard's Bay and about Long Island protection has been granted by the State Legislatures

"During the summer of 1877 an earnest appeal for the protection of the United States was received by the United States Commissions, from Block Island, signed by all its fishermen, and I reproduce this appeal in the appendix to show the feeling on this subject and the general character of the objections to the trawling. Of course, having no jurisdiction in such matters, I can do no more than to publish it in the present case I propose, in a general treatise on the plans and character of the American sea fisheries, to discuss this whole matter at length."

And the following, from the second report of the Iowa Fish Commission, will be of interest in this connection:

"At a meeting of some of the Western Fish Commissioners in 1878 the question of protective fish laws for our great Western rivers and lakes was under discussion, and I requested Professor J. W. Milner, deputy United States Commissioner (who was present) to make some examination of the subject, and report to me his views of the constitutionality and expediency of the general government taking and exercising control of such waters as were common to several States. After considering the matter at some length, he summarizes as follows:

"The point to be decided is in which must a law controlling the Mississippi fall. If it is to be decided by precedent and the whole previous history of fishing legislation it will find its place with internal police laws; but, as Mr. Fairbank suggested in our conference the other day, the work of artificial propagation is a new interest, developing new exigencies, and requiring new legislation. So far as the interior ponds and waters are concerned, containing local species, the States must, without doubt, have entire control; but in a great stream of water like the Mississippi, and in the great lakes flowing through a dozen States, and containing migratory fishes, passing the entire length of the shore of all of them, State laws are necessarily inadequate, as experience proves that little of equity or reciprocity will be considered in legislating with regard to the fishing interest. The upper States may appropriate and expend money for the propagation of fishes which the over States have it in their power to prevent almost entirely from ascending beyond their boundaries.

"The desire for general government legislation has been so generally expressed that it would be well if the State Legislatures would call the attention of Congress to the matter. The whole question is in an undecided, little understood condition, and demands investigation and inquiry on the part of all interested.

"Yours truly, J. W. MILNER."

Professor Baird says in his communication: "The State should first declare its jurisdiction over the localities where the pounds or gill-nets are located," etc., and farther on he says: "Should any one be aggrieved by such action and carry the case to the Supreme Court of the United States we shall then have the desired opportunity of settling the question."

This State has declared its jurisdiction by passing laws affecting the fishing interests of Lake St. Clair, the Detroit River, and Lake Erie; but as these laws are seldom, if ever, enforced, no one is aggrieved, and under these circumstances there is no probability of a case ever reaching the Supreme Court of the United States.

Nevertheless, as before stated, such laws exist, and I think a test case should be made up and carried to the highest tribunal in the land, for the sole purpose of settling the question forever.

Possibly, if some of the existing laws were enforced to the letter, a case might soon arise that would decide the question.

If the Supreme Court of the United States declares that the existing laws are valid, then we may press upon the Legislature, if desirable, such measures as may be necessary to secure the enforcement of these laws; and we may also secure the enactment of such additional laws as the exigencies of the case may demand.

But if the Supreme Court of the United States decides that the States have no jurisdiction in the premises, then we can appeal to Congress with some degree of confidence that our efforts will not be in vain Armed with a decision from the Supreme Court that this jurisdiction was vested in the general government we can approach Congress with a statement of the existing evils, feeling confident that they would enact, and not only enact but provide for the enactment of such laws as would tend to mitigate or neutralize those evils. Or, by special act of Congress, the undisputed jurisdiction over the common waters, with regard to the fish interests, might be conferred upon the States.

I will now notice some of the methods that have been suggested for restoring devastated fishing grounds to their former fertility, as well as increasing the general supply of fish food.

Some favor prohibition of fishing at certain seasons of the year, notably the spawning season. Others again favor unlimited propagation. Still others favor a combination or co-operation of protection and propagation, while a fourth class are of the opinion that the whole matter can be adjusted by regulating the size of the mesh so as to catch nothing but mature fish.

Other remedies have been offered, but these include the more important ones.

I will read a communication from a pound-net fisherman whose views coincide to some extent with those entertained by myself.

The following letter was read at the meeting of the American Fish Cultural Association, at New York, 1880:

MR ROOSEVELT, President, and members of the Fish-cultural Association—Gentlemen: As business compels me to stay here, and I therefore, am not able to be present at the meeting of the Association, I take the liberty to propose the following in regard to pound-net fishing

1. Pound-net fishing ought to be regulated by Congress as it is in Canada.

2. The meshes of pound-nets should be enlarged to protect the young and ungrown fish by giving them a chance to slip through the meshes.

3. Every pound-net should pay a revenue of between five and ten dollars, and receive license and a certain ground to fish on, which will prevent crowding each other.

4. One person shall not get license for more than six (6) pound-nets.

5. It shall not be allowed to fish more than six (6) pound-nets on one string.

6. Inspectors should be appointed for each of the large lakes to enforce the above, license the nets, and make out the grounds for same.

7. The inspector should be paid out of the above-mentioned revenue.

8. For the balance of the revenue, hatcheries for all kinds of fish should be opened all along the four large lakes.

Now, gentlemen, these propositions I make on a very careful study of the pound-net question, and I therefore respectfully ask you to consider the matter and take the necessary steps in regard to it, and I am convinced it will, if well managed, turn out profitable for everybody. Very respectfully yours,

THEO. REINECKE, Pound-net fisher.

I take the ground that the responsibility of maintaining and increasing the supply of the food-fishes should rest primarily with that one which derives the greatest benefit therefrom, namely, the fishermen. They alone are responsible for the decrease; their occupation of necessity is the cause of the depletion of the waters.

Self-interest in this matter would, it would seem, regulate the evil if each individual could get the benefit of his own exertions. But A does not care to plant fry or fertilize spawn at his own expense, which when mature, may be caught in B's meshes; but if B would reciprocate by planting fry to be caught in A's meshes, then, as a matter of course, self-interest would prompt both A and B to engage in propagation, which would be mutually beneficial. But with a thousand A's and a thousand B's this common agreement cannot be made; and here is where a law compelling each one to contribute his part to the common whole, would be as beneficial as it is just And I will state right here that I have taken pains to ascertain the views of fishermen, including both pound and gill-netters in this respect, and find a great majority are perfectly willing to aid in propagation, provided each man is compelled, by law, to contribute his pro rata. But I have yet to find a single member of the fishing fraternity who does not strenuously object to the close season plan.

The States bordering on the great lakes are, by their geographical position, enabled to derive greater benefit from the fishing interests therein than those more remotely situated, and should, therefore, render such assistance in the way of propagation as the importance of the case will warrant; and as the question of an abundant supply of fish food is one of national importance the general government should also aid in the commendable work.

But as before stated, this State and national support cannot be made obligatory, neither should it be. They have done their whole duty in the matter. They have taken the initial steps; they alone have come to the rescue of the declining industry; and though they can not rely upon their aid indefinitely, yet in all probability their support will not be withdrawn until the waters are restored to their former fruitfulness, and the industry is able to carry its own burden. I think no fears need be entertained that they will not continue to do their whole duty in this respect.

Now, let those more directly interested "put their shoulder to the wheel," and give the whole movement such an impetus that it will never again experience a decline. Nor should these efforts be relaxed until the waters of the great lakes are taxed to their utmost capacity, and the supply of fish food rendered almost inexhaustible.

It remains for us then to urge upon the proper authorities the importance of enacting such laws as will render the whole movement perpetually self-sustaining.

But I will be more specific as to some of the points to be embodied in a law which would, in my opinion, tend to bring about the desired results.

I would have the fishing grounds of each fisherman clearly defined, and protect each man, within his own territory, from the infringements of others.

I would allow each man to catch the fish within his prescribed limits, at any or all seasons of the year, and by whatever process he might elect, to secure for himself the greatest possible revenue

But in consideration of this protection of the one from interfering with the other, and of this non-interference at their most profitable season, namely, the spawning season, I would levy an annual tax or license-fee on each pound, and on each fathom of gill or seine nets in use.

I would use the net proceeds of this annual tax exclusively for the propagation of the most valuable food fishes.

I would have the fishermen render all possible assistance, that would not interfere with the prosecution of their work, to the properly authorized persons in the collection of spawn.

The amount of the tax, and an equitable arrangement as to priority of claim to certain localities, could be easily adjusted so as to give satisfaction to all parties interested.

The license given to each man should prescribe the limits of his territory, and state the penalty for the violation of its provisions.

The penalty suggested in Prof. Baird's communication would be, I think, sufficiently severe to secure the observance of any or all of the measures I have suggested.

I will quote entire as follows:

"Let one of the penalties of the law be the forfeiture of the right and the giving of it to the person who furnishes the information of the violation. This, with a fine and confiscation of the property, will be sufficiently severe for the purpose and one that would induce all kinds of people to be on the lookout for a chance to report to the authorities."

In conclusion, I will say that I have weighed this matter carefully, and although my views may be open to criticism, I think the measures suggested will, on the whole, accomplish the greatest good to the greatest number.

The fishermen will willingly submit to compulsory propagation for their own benefit, and thus the reconciliation of this class is accomplished—which would not be the case if the close-season plan is adopted; while the tax-fund, augmented by the contributions of the State and nation, will be abundantly ample to increase the supply of this valuable food to almost unlimited proportions.

Thus it will be seen that my views as to what should be incorporated in "Fish-laws, including propagation as well as protection," may be summarized in one brief clause, viz., Protection for the fishermen and propagation for the fish.

FRANK N. CLARK.

FECUNDITY OF ALEWIVES.

THE alewife, *Pomolobus pseudoharengus*, common to Maine, might have been well termed the farmers' fish a half century ago. Then all of our rivers were annually thronged with countless multitudes of these fish, and to this assemblage of the multitudes came the farmers from the interior to join those residing on the banks of the streams in harvesting the bounteous yield that nature afforded. Although many fish were cured and preserved for food yet great numbers were taken and thrown upon the fields as fertilizers, so greatly did the supply exceed the home demand.

Foreign markets were not sought nor considered accessible, and tons of a certain supply of food that had grown without aid from man were thrown upon the land simply to aid in producing after an expenditure of time and labor an uncertain crop.

But little care was given to the cultivation or protection of nature's supplies in times of such abundance, and "fish farming," or raising fish for markets in other communities, an industry now well established on Long Island, New York and elsewhere in the United States would have been regarded as a visionary scheme.

During the spring of 1880 while in performance of duties as a Commissioner of Fisheries in planting one of the great fish farms of Maine, Sebago Lake, with alewives, the writer was asked many questions about these fish then for the first time introduced to the above-named lake and its connecting waters.

I had no accurate data relating to the fecundity of the alewife, except such as was obtained by comparison with the shad and herring fishes closely allied to them, and failing to find anything satisfactory in books of reference accessible to me I applied to the fish itself for the desired information.

The following brief summary of the result of my interviews may be of possible interest to others:

The fish examined were some of the various lots taken in Fore River, Portland, at the outlet of the old canal "Basin," May 28 and June 2, 1880. Selecting some of the largest, the smallest and medium sizes, I weighed the fish and their ova while fresh. Then I boiled the ova slightly and dried them as uniformly as possible. These ova I weighed again upon a fine balance scale (Henry Troemner, Philadelphia, maker) graduated to weigh one-tenth of a milligramme. Selecting the eggs that were the most evenly dried I separated them, and divided into portions of thirty milligrammes each. Carefully counting, by aid of a magnifying glass, the eggs in each portion, I learned the total number of eggs in each fish. A comparison of the ovaries showed that in all the right ovary was larger than the left. This variation is very marked in most cases and readily noticeable to the eye before comparison by weights.

The following memorandum is copied from my notes and corresponds to the notes taken of other fish. None of these fish were of very large size:

"Fish No. 1—Large: fresh weight 11 oz. averdupois: right ovary, fresh weight, 1 oz.; left ovary, fresh weight, .75 oz. Weight of an ova (1/24 oz.) 16 per cent. of total weight of fish. Fish No. 1, dried ova, 15.3 grammes; average number in one gramme, 11,783.3 total ova in Fish No. 1, 180,284. No. 1, an 11-oz. fish, contained about 16,389 eggs per oz. of total weight. No. 4, a 6¼ oz. fish, contained about 18,736 eggs per oz. of total weight."

My investigations have not been carried out upon so extensive a scale as I would like, but were very carefully made; and upon them I estimated that the average number of eggs carried by the alewives examined was 150,000 to each fish.

I made six trips with alewives from Portland to Sebago Lake and placed 621 fish alive therein. The alewives require a great deal of air and constant attendance during transportation, and I tried to ascertain whether salt or fresh water would serve best. On June 2 five barrels of salt water and five same number containing fresh water, 21 gallons in each barrel, were taken, with a supply of ice for use *en route*. We started with 143 fish and lost but two of the number, so that no preference could be had for either salt or fresh water by this comparison. Estimating one-half of those 621 alewives to be females, the total number of eggs carried would be about 46,500,000. If but ten per cent. of this number were hatched the returns will be bounteous enough.

What a field for fish culture the alewife affords! This fish, although anadromous, will live if confined in fresh water throughout the year, and I have no doubt will breed in such confinement. There is quite a general theory that the young alewives first return to the place of their nativity three years after being hatched. My own observations lead to the belief that the *alewives return when two years old*. Last year in Maine, as there have been no alewives put into Sebago Lake previous to those above referred to, here is an opportunity to demonstrate the facts concerning this subject.

Besides the intrinsic value of this fish, which is less oily, of greater size and superior as food for man to its cousin, the herring, the alewife fills a very important place in the economy of nature. It attracts to our bays and rivers the larger fish of the sea, and its numerous progeny afford a supply of food for the fishes of our streams and lakes. And by affording the alewives access to the lakes the salmon, trout, bass and other fishes there resident may be increased in numbers proportionate to the increased amount of food supplied them, and the fishing in the bays along the coast improved by attracting inshore the sea fishes such as the striped bass, cod, etc.

EVERETT SMITH.

Portland, Maine.

REPORT OF THE WISCONSIN COMMISSION.

THE seventh annual report of the commission, for the year 1880, opens with the statement that "the hatch and distribution of brook trout was far in excess of all that has heretofore been done; while the propagation of whitefish and lake trout was fully up to the standard of past years." It notes the fact that the work of fish culture in the United States has received great stimulus from the labors of Prof Baird, and also that the States bordering upon the great lakes have not relaxed their efforts, but, by liberal appropriations, have been able to extend their operations. Protective laws are asked for to prevent the slaughter of fish during spawning season and at the foot of dams. The subject of fishways also attracts the attention of the commission and a cut of "Rogers' Fishway" is given as the best idea of a correct form.

Nearly six millions of whitefish eggs were hatched at the Milwaukee hatchery and distributed to waters, afterward embodied in the report of Supt. Welsher. Three and a half millions of lake trout also were hatched and distributed; while this season one million of brook trout eggs had been secured at the time of writing, with the prospect of half a million more to be taken. Of adult brook trout there are in the Madison ponds 5,000 four-year old fish, 10,000 three-year old, 9,000 two-year old, 5,000 one-year old, and about 60,000 of last winter's hatching; making a total of 89,000 trout of all ages. Arrangements have been made to secure eggs of wall-eyed pike (*Stizostethium*) and hatch them. Of carp, there are now in the Madison ponds seventy-five which will spawn in the summer of 1881, as well as a hundred and fifty of this year's growth—all obtained from the U. S. Fish Commission; the demand for this fish

in Wisconsin being greater than the commissioners have been able to supply. Of quinnat salmon, about 1,500 were developed from eggs obtained from the U. S. F. C., and many of the larger ones were placed in inland lakes last summer. Rainbow trout are represented at the Madison hatchery by 2,000 specimens hatched from eggs received from the U. S. F. C., and applications have been made to Prof. Baird for more.

Operations at Milwaukee have been suspended on account of the enlargement of the city water works, necessitating the use of the room heretofore kindly loaned the commission for a hatchery. An offer of accommodation in the hatchery of Mr. N. K. Fairbank, at Geneva Lake, was made and accepted, and here Supt. Welsher has taken the eggs of the lake trout obtained during the past fall. The Milwaukee Industrial Association has kindly offered the commission the free use of a room for hatching and aquaria in their building which is now in process of construction; and with these increased facilities it is hoped to carry on the propagation of lake trout and whitefish on an increased scale without an increase of expenditure.

The report of Supt. H. W. Welsher embodies the facts above given and many letters showing the progress of fishculture in the State. On the whole, it is a good report of work done, and is only marred by an alleged list of the scientific names of a few "varieties" of fish which is ludicrously incorrect, and should either be arranged by some competent person or withdrawn from future reports.

REPORT OF THE WEST VIRGINIA COMMISSION.

THE report of this commission for the years 1879-80 calls attention to the fact of an increased and awakening interest in fish culture throughout the State. The black bass have succeeded in the New and Greenbriar rivers beyond expectation, from about 1,500 fish, 300 of which were mature, deposited in 1878. These rivers contained no fish of value except "blue-cats" for miles on either side of the points at which the plants were made, and are now "swarming with black bass weighing from one to four pounds." On this subject Dr. C. Sydney, of Hinton, writes as follows: "I have never seen better fishing with line and rod than is now to be had at New River Falls. I caught over forty-five large bass in one day's fishing, and could have caught more if I had bait." Mr. N. B. Wiggins, of Summer's County, reports great numbers of black bass at his place on the Greenbriar River, and also the taking of several land-locked salmon.

Shad which were planted by Prof. Baird some years ago have been taken at Huntington, on the Ohio River, and the Commissioners have heard of others being taken, and they believe that shad have been up the Kanawha as high as the falls for the purpose of spawning, but as no seining was done during the spawning season, no specimens were secured. Quinnat salmon which were deposited in the tributaries of the Potomac have been seen and caught at various points along the South Branch and the Potomac.

Some carp averaging two to three inches in length were obtained from the U. S. F. C. in November, 1879, and as there were but few they were divided to prevent entire loss. These fish are now of four pounds weight, and ready for spawning. Commissioner Lowry has introduced into New River, at and above the falls, a number of silver perch, white perch and wall-eyed pike, and has placed black bass in the Gauley River. In addition to this 165,000 young shad, furnished by Prof. Baird, have been placed in the New and Greenbriar rivers. Thanks are returned to Prof. S. F. Baird and T. B. Ferguson, of the U. S. F. C.; to Vice-Prest. Wickham, of the Chesapeake and Ohio Railroad, and to Vice-Prest. Keyser, of the Baltimore and Ohio Railroad, for favors received.

THE SAIBLING—Manchester, Feb. 21.—I am very glad to see Prof. Goode's article on the "Saibling" in FOREST AND STREAM, of the 17th inst. An error is made, however, in locating Winnepesaukee Lake in Maine. This is not important, however, as this lake will not be the testing place of these fish, as after consultation with Professor Baird we have decided to place these fish in Newfound Lake, a beautiful sheet of water in the towns of Bristol, Bridgewater and Hebron, about nine miles long and from one-half a mile to two miles wide. There are no black bass and but few pickerel in this lake to destroy the young fry, while there are plenty of minnows, shiners, etc., for fish food.

The lake trout (*Salmo namaycush*) are indigenous to its waters, which are very deep, and some seven or eight degrees Fahrenheit colder than the waters of Winnepesaukee.

Newfound Lake is only seven miles from the State hatching-houses at Plymouth and if the saibling thrive there we can easily procure eggs from them for stocking our other waters. Our young salmon and trout are hatching finely and we shall have busy work distributing them as soon as the rivers and brooks are open.

We are hoping this summer to introduce the German carp to our State, Professor Baird having kindly promised us some, and have copied from FOREST AND STREAM for our annual report, now in preparation, Mr. Walther's article on the growth of these fish, read before the Central Fishcultural Society.

I have no doubt of the correctness of Prof. Goode's surmise that the *Salmo oquassa* is also a char, and am inclined to think that the trout of Diamond ponds, in Stewartstown, N. H., are of the same variety and shall endeavor to procure some in May or June and send to the Smithsonian Institution for identification.

They have the forked instead of square tail, which has always seemed to me one of the distinguishing characteristics of *Salvelinus fontinalis*. SAM'L WEBBER, *Com. of Fisheries.*

PROPOSED DAMS IN THE DELAWARE—Philadelphia.—I send you with this communication a form of petition which is to be sent to our Senate and House of Representatives to prevent the erection of dams, even with a so-called fishway attached, on the Delaware River. I have found these papers at the different gun stores, and especially the two at Mr. John Krider's, well filled with signatures. The petition reads:

To the Honorable the Senate and House of Representatives of the Commonwealth of Pennsylvania:

We, the undersigned tax-payers, residing near the Delaware River, in the city of Philadelphia, or its vicinity, desiring to express our opposition to a bill presented, or to be presented, to your honorable bodies, to authorize the erection of one or more dams in the River Delaware, between Bucks County, Pennsylvania, and the opposite shore of New Jersey, respectfully set forth that the erection of any such dams, even with so-called "fishways" attached, would obstruct the free passage of shad to their spawning grounds in the upper waters of the Delaware River and lead to the ultimate destruction of the fishing interests of said river—an industry now worth over $3,000,000 annually, in which more than fifteen thousand people are directly employed, three-fourths of whom are residents of Pennsylvania. Over one million people depend upon the Delaware River for their supply of shad during three months of the year and, owing to increased protection given this fish by laws passed by your honorable bodies, it has become sufficiently abundant and cheap to be enjoyed by all classes of the community. Your petitioners therefore pray that you will not allow this great industry and source of food supply to be destroyed by the erection of dams in the Delaware River.

CARP IN TEXAS—Willis, Texas.—Of the carp sent by the U. S. Fish Commission to Texas, Capt. R. G. Ashe, of our town, and myself secured eleven a day or two before Christmas—quite a cold and raw day. Capt Ashe has an excellent pond, an excavation used as a reservoir for water supply to steam gin and mill. The pond is some sixty feet in extent each way and seven feet deep, but he is now beginning to enlarge it to twice the present size. This pond is full of "bull-head" cats and sun-perch and, desiring to remove these before we introduced the carp, and the weather being too cold to work at it, on arrival of the little strangers (the carp) we took a linwood barrel and bored small holes all around it and put some four inches of dirt (soil) in the bottom, sank the barrel in the pond in two feet of water, where they have remained ever since. One of them died on the day of arrival from rough handling before we got them. That one I have kept in alcohol to show. The rest, ten in all, are still in the barrel and doing finely.

Mr. Ashe feeds them on cornmeal bread, or dough made of part flour and part cornmeal. They are doing well so far. We will turn them loose in the pond as soon as we can get the other fish out, which we intend doing with a seine. We would be glad to have more light on the management and feeding of these fish and hope that some one better posted will give us, through the FOREST AND STREAM, some dots. These fry are too young to eat cabbage or lettuce or any gross food, but they have to be fed, of course, upon such as their throats can accommodate. I will say in this connection that the water in this barrel froze some two or three inches thick. Capt. Ashe built a fire around the barrel, o-tside, to thaw the ice and could not do it, and then broke the ice with an axe, inside the barrel, thinking the fish would need air. The barrel is sitting in two feet of water only and all this rough treatment does not hurt them. They are as lively as crickets now. I would write you more about these little "wards," but will wait further development. Perhaps it would be of interest to Prof. Baird to know how well his little "delicates" stand the rough and tumble of Western life. C. L. J.

LAND-LOCKED SALMON FOR NEW BRUNSWICK.—A box containing 54,000 of Sebago Lake salmon ova, or land-locked salmon, was received last week by Mr. W. H. Barbar, guardian of the hatchery at Rapid des Fermues, Grand Falls, New Brunswick, from Mister for the Hon. Levite Thériault, M. P. P. The fishes are to be liberated when hatched in Tobidi River and Squadook Lakes. Mr. Theriault has a fishing and hunting lease of the Tuladi River. Its waters are well known by sports-men to contain trout and tobidi, and when salmon are introduced Mr. T. will have as fine fishing grounds as there are in the Dominion. These salmon will eventually descend the Madwaska River to the St. John, and from thence to all its tributaries al ove Grand Falls.

HOW DO BLACK BASS SPAWN?—Indianapolis, Ind.—My black bass are doing well. I put them in a small pond two years ago in hopes of being able to make some close observations while they were spawning, but failed on account of an accumulation of vegetable matter, which thickened the water so that the fish could not be seen. I have reason to believe that when the female is ripe she lies on her side over the prepared bed and the male fish presses the roe from her, during the operation looking very much as if he was biting her along the belly. From time to time, as the roe is deposited, he ejects the milt over the bed, impregnating them. As I have no use for these fish except to make observations, I am willing to give them to any one who wants them for stocking purposes. The largest fish in the pond is a small-mouthed bass that will, or would, weigh four pounds, and I think there are about forty in all. —GRINGO.

EARLY FISHWAY LAW.—The records of the town of Plymouth, Mass., contain the following resolutions, adopted at a town meeting, April 22, 1673: "It was ordered by the Towne that the fish Called the alewives bee not hindered by the mills or otherwise in there goeing up and they be afforded water sufficient to Repair to the salt water when the flood Gates are shut Downe and that none shall take any such fish in theire Going up except for eating, and that the wast gate be Drawn up every night in the season the fish are going up and that butt one ware be made for them in theere coming down. And serjeant harlow and Jabez howland are appointed by the Towne to see these orders Respecting the fish be Duly executed and p formed." In this, as in many other things, the good old New England worthies set an example which their descendents may profitably follow.

The Kennel.

April 1, at Columbia, Tenn.—Close of entries, National American Kennel Club's second American Field Trial Derby. Joseph H. Dew, Secretary.

April 26, 27, 28 and 29, at New York City.—Westminster Kennel Club Fifth Annual Bench Show, American Institute Building, Third avenue and Sixty-third street. Entries close April 11. Charles Lincoln, superintendent, No. 138 Fulton street, or P. O. Box 1,709, New York City.

FASHION AND DOGS.

FASHION extends even to the kennel. According to the old proverb "Every dog has his day," and the various breeds are each in turn by fashion made popular. Some years ago collies in London were very fashionable, and it was the correct thing to have a black and tan collie at one's heels on all suitable occasions. I believe the Queen first brought this breed into notice. I remember seeing in London a photograph of Her Majesty taken holding a sheep dog by the collar on a chair to have his portrait taken. The picture was a good one, and to my mind one of the most pleasing I have ever seen of royalty. The dog looked a real workman, such as you may see behind any drove of sheep in England; but he would have looked out of place among his brethren of the Park or Piccadilly—the black and tan, silky coated, silver collared followers of the "upper ten."

Bull terriers had their day, and they deserved to be fashionable, but the line here was drawn very fine—no black patched, fighting style of gentlemen had any chance, pure white was the color, and the old-fashioned half and half dog was nowhere. The call of fashion in this case was the cause of great improvement in the breed, as the style of dog generally seen now show very little of the bull dog, although they retain his courage. Small bull terriers make handsome pets, and besides are always ready for anything in the shape of mischief or fun.

Dachshunde for a time were all the rage, but, as I expected, they are gradually going out of fashion, for they have really very little to recommend them. A good terrier is much handsomer, and will do anything a dachshund is capable of if we except the music on a trail, and a beagle is better, and in English eyes more suitable for such work.

Fox terriers are still very fashionable, and they are likely to retain first place for some time, being fit for either the field or the drawing-room; fine, bright, active, intelligent, brave little fellows, and their small size and impudence make them great favorites with the ladies.

Pugs are always in demand, but the scarcity of really good specimens prevents them being common.

Setters and pointers of course are always in general use by sportsmen, and are not much affected by fashion, but even here the different breeds and strains have each their day. The wild Irishman or the Gordon, the Laverack or the English, first one then another.

St. Bernards and mastiffs have had their innings, but their size will prevent them from ever becoming really a fashionable breed; a young St. Bernard educated is like a tame donkey around a house and can do a deal more mischief.

The poor Spitz dogs had their day, as it became the notion to imagine that every canine of this breed must necessarily go mad, and they were doomed accordingly. I have known lots of these dogs as harmless as pet lambs (and of about as much use).

Cockers are having a run just now, and they no doubt will remain favorites, being useful, clean, handsome, good tempered, intelligent, and last but not least, not too big for the parlor. I am glad to see that a cocker club has at least been initiated, and I wish it every success. I expect as a result to see a great improvement in the breed, at present it is extremely difficult to get any two men to agree as to what a cocker really ought to be like.

But I must not take up your valuable space with any more about the past fashions, but in a few lines I will try to give my ideas as to the coming breeds in public favor.

I am a great lover of dogs, and very little in the kennel departments of FOREST AND STREAM and similar publications escapes my notice, and by watching the advertisements and other notices one can form an idea as to the turn the fashions are taking.

I think the bull dog will shortly come into notice. Already several good dogs have been imported, and the style is improving in the classes at the dog shows. Vero Shaw, who, I suppose, is one of the first authorities on bull dogs, in his "Book of the Dog," p. 401, says: "The bull dog, pure and simple, is, as a rule, a harmless, good-natured beast, long suffering and very slow to anger." A well educated bull dog makes a good house dog, as they are quiet, clean, patient with children and always on hand in defense of their master or friends.

The English retriever is coming to the front also, and when better known will be greatly liked by Americans. Their handsome, intelligent appearance and useful size must recommend them to all wanting a pleasant companion.

The beagle, too, will be inquired for in thickly settled districts, where game is scarce, lots of fun can be had with beagles, either single or in packs, and I think the merry, musical little fellows will soon be plentiful among us.

When fashion creates a demand for any particular breed the want is soon supplied, and great improvement to the breed results from the high prices obtained for good specimens, as it encourages breeders to import good animals. In conclusion I would say to breeders of fine stock, be in time and anticipate the coming demand for bulldogs, retrievers and beagles—advertise in FOREST AND STREAM, and you may thank me for this "tip."

St. Leonard, P. Q. HEMLOCK.

HAVE DOGS AN EXTRA SENSE?

MR. SIMONDS in your last issue asks this question and seems to think it should be answered in the affirmative, drawing his conclusion from the fact that a faint odor is apparently neutralized by a rank one to the human sense, and from what he states to be a fact that a dog's ability to find a bird by his nose is not destroyed by the effluvium from carrion in which he has rolled. If the latter were a fact it would still not prove his point, the true deduction being that a dog's nose is so much better than a man's, that he is capable of distinguishing two odors at the same time and that a man is not. I have for years indulged in hare shooting, using hounds, and have long noticed that the dogs were put at fault by my presence near the place where the hare had just passed, more particularly when the place has been a road dividing the covert, which a hare always crosses with great jumps. If no one is near the place where the hare crossed the dogs will go straight on without stopping, but will hardly ever do so if any one is standing near, only doing so when the scent lies particularly well. I have always thought the cause of this to be the overpowering scent given off by the man. There is no doubt but that a dog's sense of smelling is something that "no fellow can understand," and satisfied the dog knows every odor, distinguishing the one from the other just as easily as human beings distinguish by the eye one object from another; but it always has been a subject of wonder to me how a hound so quickly knows the direction his quarry has gone. I have often put the dogs on the trail and started them the wrong direction, but always in a few feet, or yards at the most, the error is discovered. They must be able to detect whether the scent gets stronger or weaker each step.

I think not only in each kind of odor known, but each animal of the same genus must have an odor peculiar to himself, for the hound steadily pursues for instance, the hare he first starts, notwithstanding the covert is full of others moving about and crosings the track already made by the one pursued, the dog's instinct or reason teaching him that unless he pursues one alone he can never succeed in killing. I say *reason*, because young dogs often take a fresh trail but old ones never. Then, although a dog undoubtedly recognizes you by the eye, some dogs much more readily than others, but he never seems to be certain or satisfied until he uses his nose. To test this, call your dog in the open air, and when he gets near you, take no further notice of him, and you will find he places his nose against you.

The impression made in the dog's mind through the eye is not lasting and he carries the recollection of his absent master in his nose, not very poetical, is it?—but true. Years ago I left home and was absent about six months, leaving behind me a young pointer about a year old. On my return I went to his kennel, and he was chained, so that when him, but he directed all his attention to a friend who went with me and who was known to the dog. I thought the puppy had forgotten me and felt the slight only as a dog lover could, and I advanced and put my hand on his head. In a moment he dashed his nose against my wrist, and with a howl of delight jumped upon me, testifying in every way a dog could his delight. His eye had forgotten me, but not his nose.

My dogs recognize by their nose the horses they are in the habit or following, and will show at once when one has passed along the street shortly before, but would take no notice, aided by the eye alone. And every one will have noticed how easily a dog follows his master's footsteps along the path where dozens of others have just passed. I think any one should be satisfied that the dog's sense of smelling is so acute as to render it unnecessary to add an extra sense to account for the dog's conduct. GUNNER.

Walkerton, Ont., March 2, 1881.

THE EASTERN FIELD TRIALS CONTROVERSY.

PROVIDENCE, R. I., Feb. 1881.

Editor Forest and Stream:

Allow me to say a few words in behalf of myself and friends who ventured with a few native dogs to the late Eastern Field Trials in order to compare them with the crack dogs of the country, in regard to the articles that have lately been published under various *nom de plume*, as "Creek," "Verdict" and C. B. Whitford, the latter of whom I take to be one and the same as far as writing goes with the editor of the sheet publishing it.

"Creek" wants the owners of Smut and Nat to come out and witness the "Southern manner of shooting over dogs—the only way 'fore Heaven' in which gentlemen should ever shoot, on horseback over a brace of dogs, a servant behind to carry luncheon and another to carry the game."

He goes on to say that "shooting in the East ceases to be pastime and becomes a labor." This would seem to be his idea of what the unfortunate inhabitants of the Eastern country are pleased to go through to obtain a little shooting. I am most willing to admit that the Western and Southern gentlemen live in a region more favored by nature for the production and pursuit of game than we unfortunate Eastern sportsmen. Alas! we have to depend on our legs to carry us from morning till night, to hunt our own dogs, to carry our own lunch and what little game we may be fortunate enough to bag. As varying as are our modes of hunting so are the qualities of the dogs we need. And if "Creek" has not got enough brains to understand this, why Heaven help him.

The owner of Nat is, no doubt, competent to choose his own acquaintances and associates, and if it is his pleasure to give the preference to a "dog handler" who is an honest man, instead of to a set of dog sharps and their parasites—such as the editor of the paper referred to—he should be allowed the privilege.

As for "Verdict," his statements clash with the truth (we used to call it lying) when he says that the FOREST AND STREAM gave the preference to Gladstone in his heat with Nat. As he was not on the ground and gets his information probably from Mr. Bryson, he is not worth wasting ink on; so we will let him drop. He had better learn to read, and then, perhaps, he may be better posted.

As for Mr. Bryson, the owner of Gladstone, he refused to accept Mr. Bloodgood's challenge; his dog was beaten by Rose, Jr., as all honest men know; he tried to seek shelter under the wing of the owners of Sensation, who knew better than to come to the front, and the least said about him the better for himself and his dog.

C. B. Whitford. In his letter of February 19 referred to is shown the animus of this man. This letter was probably written by the editor who published it. At all events, it sounds like him; and to quote anything from that letter would be to defile the pages of the FOREST AND STREAM. The two columns and a half in that issue are a tissue of lies from beginning to end, and no decent paper would have published any such statements.

Col. Gordon is no doubt a type of the high-toned Southern gentlemen, of whom we have heard so much. High toned Southern gentlemen don't count any more as judges in a field trial than high-toned Northern gentlemen. It would appear from the reports of the trial that all the reporters of the prominent papers present gave the colonel dead away, as far as his judgments went. The "old

field editor" did the best *he* could in saying, "the judges did the best *they* could." What Col. Gordon don't know about judging dogs would make a very valuable treatise on the subject. His statement that Gladstone took a point away from Nat is false; for Nat was standing staunchly and Gladstone was stopped by his tricky handler, Whitford, and no more scented the bird than the Colonel did. Supposing the said Colonel to be honest—and his decision of the Saint-Sensation heat leaves grave room for doubt on that point—he is too innocent ageutleman for occupy the position he held. His allusions to the bitch Smut being taken off the field on the first day for inefficiency are about on a par with his other statements. I defy Col. Gordon to show where Smut committed an error in the heat with the bitch Bell for which she should have been taken off the field. Had the judges acted fairly they would have given Smut the heat, for Bell made a flush and two chases at the start, for which Col. Gordon would have the public to believe Smut was to blame. He docked her for not backing a bitch that was not staunch, and broke shot, and chased whenever a bird flew. He allowed her to be brought on again, he says, only at the solicitation of some members of the club. What sort of a judge is he who allows himself to be so influenced?

Let us in a Christian spirit hope that the Colonel's errors were from the head and not from the heart, and that his years may be lengthened in the land that he may live to correct his ways.

It is not for me to give advice to the members of the Eastern Field Trials Club and their committee of management, but I would respectfully submit we *don't* hunt on horseback, with a mounted servant to carry the lunch, and another to carry the game. We do not go in for speed and style, for we have not space when we hunt to let a dog go over a hundred miles of ground a day, but we do claim that for our style of hunting, and the game we hunt—ruffed grouse, quail and woodcock—that our dogs are better for our purpose than the type of dog represented by Gladstone and as we should fail, with fair judgment, in hunting our dogs against him in the West and South, so does he fail when brought into fair competition with us in our Eastern country.

Field trials to be fair must be local, there is no help for it, and the sooner this is recognized the better. T. M. ALDRICH.

HINTS TO THE AMATEUR BREAKER.

COMMON sense shows that a dog should not be corrected for disobedience unless it is certain he knows his fault. Punishment is absolutely necessary at times, and that of the most severe description with certain dispositions; but always be satisfied that the act for which the whip is raised was committed with a full knowledge that it was wrong. Show me a cringing and supplicating dog on being called and his master will be found an unreasonable being with an uncontrollable temper, utterly unfit to train or manage a puppy. Such a dog has been unmercifully flogged before he has been taught and made to understand his line of duty, and fearful of a repetition of the lash—for what he knows not—obeys the summons, cringing and creeping. Such exhibitions are detestable. The servant is to be pitied—the master condemned.

Dogs are wonderfully apt to notice cause and effect. It amounts almost to reason; and it is astonishing how readily a puppy will repeat an act or performance that has once earned a caress or brought a reward. In breaking a dog we must not only be firm, but his self-will. Begin at once in a mild yet firm manner and have him understand that you do not intend to allow any deviation from the path of obedience. By this line of action you gain his confidence, and, above all, his affection. Flog as little as possible, and be ever ready to reward good behavior. Adopt the check cord method of training, for it is never-failing; and the dog punishes himself, attributing it more to his own actions than to that of his master. Should your pupil be a quitter show no weakness in noticing game or if he appears to have little desire for the chase (I have known and owned good dogs of fine breeding that were thus bebindhaud in noticing game afterward proving excellent), take him into the field with an old stager until he shows a liking for it, then work him alone, for fear he may grow up with a lack of self-dependence and be satisfied only to back another dog's point; in other words, a willingness to "play second fiddle." Make your setter or pointer your companion continually, that he may learn your voice, your look and your manner. Be patient and without anger in your lessons and you will surely succeed in his training.

HOMO.

THE COCKER STANDARD.

BY the FOREST AND STREAM I see that I have been elected one of the committee to frame a standard for the "Cocker Club," under which their spaniels shall be entered and judged at future bench shows. As it may be impossible for me to be present and take an active part in the proposed meeting, I take the liberty, through the columns of your paper, to state what I think the standard should be, also my reasons for same.

I believe the standard should be based on the best authorities of the present day. Stonehenge I consider such. On this subject he says: "The springer is a larger dog than the cocker, has a longer nose, a smaller eye, with great strength and hardihood. He gives tongue sooner on scent, is more impetuous by nature, requiring strong coercion. The cocker, on the contrary, has a much more delicate nose and a keen perception of the shades of scent, giving a slight whimper when first touching upon it and changing to a merry note only when quite hot upon his game. Cockers are exceedingly pretty workers, and if they had equal powers of endurance with the springer they would be ten times more valuable, their fault ever so liable to be torn and bruised that a few hours knocks them up." In a later work he says: "The cocker cannot be minutely described, inasmuch as there are so many varieties in different parts of Great Britian; he may, however, in general terms, be said to be a light, active spaniel of about fourteen pounds weight on the average, sometimes reaching twenty pounds, with very elegant shape and a lively, spirited carriage. The head should be round and forehead raised; the eye is of medium size, slightly inclined to water, but not to weep like the toy dog's; body medium length and shape, generally resembling a small setter; coat thick, flat or wavy, but not curly, that showing a cross with the water spaniel. With regard to the Welsh or Devon cockers of former times they are scarcely to be met with in their purity and of the regulation size—twenty to twenty-five pounds; most of them have been crossed with the springer or by improved management increased in weight to at least thirty pounds, which militates against their use in some covers. The modern field spaniel is more like the springer than the cocker." "Idstone" says: "The cocker is, as compared with the springer, what the beagle is as compared with the fox hound," virtually saying the cocker should be a small dog. In view of this evidence it strikes me that but one satisfactory and correct standard can be made, which takes Stonehenge's standard as to formation, making two classes, one under twenty-five pounds and one over twenty-five and under thirty-five pounds. This, if pure specimens are exhibited, will show the cocker of former days as the modern or improved cocker of field or field spaniel. A discriminating public will soon settle the question which is their favorite. As a member of the committee I would advocate a standard be formed in accordance with above, adding such minor details as may seem necessary. This will be no hardship on those breeders who have endeavored to keep up the pure breed, neither on those who have, by judicious management, endeavored to improve the breed the better to adapt them to stand the field work required of them in this country. Regarding color, it is a matter of fancy; while some prefer solid colors, as black or liver, others are far better pleased with those having a large portion of white. Consequently, no one color should be given prominence over another.

J. H. WHITMAN.

DORR.—We call attention to the notice of Mr. Fred. A. Taft in another column, stating that he has placed his Gordon setter dog Dorr in the stud. Dorr is a large, bold, powerful dog of great endurance, and was winner of one of the prizes at the Nebraska field trials last autumn.

THE COUNT NOBLE OFFER.—Dowling, Mich., Feb. 23.—*Editor Forest and Stream:* Since you allowed "Fritz," of Pittsburgh, to freely use your columns to abuse me, I suppose you will as freely grant me space to contradict what he infers somebody told him. So far as the individuality of "Fritz" is concerned, it's a conundrum, or, perhaps more properly, a mathematical problem, which may be solved on strictly mathematical principles. We have six unknown quantities given to find "Fritz," of Pittsburgh. Four of these quantities are in Pittsburgh, one in Arkansas, and one in New York. Which is "Fritz?" The four from Pittsburgh deny being my part of "Fritz," so we have left one in Arkansas and one in New York. The one in Arkansas is out of the question, as FOREST AND STREAM would not receive letters from Arkansas and date them Pittsburgh. If the problem has been properly stated and worked so far the answer is easy. If, however, there has been a mistake in the calculation, the answer is a conundrum. If "Fritz" knows anything for certain, and he will be man enough to state it over his own name, I would take pleasure in trying to convince him he was laboring under a delusion, but as the matter stands now it is an aggravation and a reflection on my dignity to notice him. For the sake of the honorable gentlemen who acted as judges I feel in duty bound to point out to the public some of his many errors. Speaking of Gladstone and Count Noble, he says: "Pools old high on them." I was not aware that any pools were sold on my dog. He was sold in the pools once, and that was after he had run. This pool was bought by a Pittsburgh man. Each pool sold on Gladstone was bought by Whitford. All this was a private affair and no business of "Fritz" or anybody else. If any one wished to speculate as to the chances of these dogs it could have no effect upon the race whatever. "Fritz" objects seriously to my having been offered one thousand dollars for Noble, and offers a gross insult to all parties concerned by holding the matter up to ridicule as not having been a *bona fide* offer. Now, I have no desire to make capital for my dog, but the exact facts I wish to state are these: Mr. McDonald saw Noble run and wanted him bad enough to offer one thousand dollars for him. After he had made up his mind to give this he was attacked with a chill and was obliged to leave the grounds. Before doing so he authorized another party to make the offer, which he did quietly, and I quietly refused it. I paid for Count Noble, and I believe I have a perfect right to refuse to sell him. Whether Mr. McDonald meant in any way that he offered it or not I neither know nor care. I am perfectly satisfied, however, that he was not only willing but anxious to get the dog in exchange for his one thousand dollars. I think things have come to a pretty pass when a man can't refuse to sell his dog without being accused of trickery. In reference to the heat between Noble and May, nearly every one considered it the fairest kind of a race. May outspeeded Noble, but Noble made three points and one flush, while May made one point and three flushes. The heat was short, to be sure, but after May had refused to back she had no chance of winning. I would not detract a particle of merit from Mr. Snellenberg's grand little bitch, but in justice to the gentlemen who acted as judges, I must say had the dogs run an hour longer it could not have made enough difference in May's favor for her to have won "Fritz" says Noble should have been cut for staunchness. To show how little he knows of what he writes I must inform him that Noble was cut for staunchness, so says Mr. Morford, and I suppose he knows whereof he writes. D. C. BANNON.

[Our correspondent is decidedly natray in his "mathematical" remarks. There was no need of going to Arkansas, nor of coming to New York for "Fritz." The letters dated at Pittsburgh, Pa., signed "Fritz" and published in the FOREST AND STREAM, were written by a resident of Pittsburgh, Pa., and mailed at Pittsburgh, Pa. If the "mathematical principles" involved give any other solution respecting "Fritz's" identity and residence they are widely at variance with the facts in the case.]

ADVICE TO BREEDERS AND BREAKERS.—If the breeder desire to be sure that he will not be charged with dishonesty or misrepresentation in the sale of either setter or pointer, especially that of broken dogs, learn the character of the party to whom the sale is to be made; ascertain if he is capable of judging, and by all means take him into the field with the dog and show the performance of the animal. We hear lately of so many charges made against perfectly reliable breeders, and knowing the purchasers of some of the dogs, we are confident a number of these complaints spring from an utter ignorance of what a setter or pointer should be in the field. Few dogs will at once work properly for a new master—in fact there are scarcely two sportsmen who hunt alike. There may be peculiar motions of the hand and tones of the voice of command used by one which the setter or pointer invariably looks for, while by another none are noticed, while very different signals or gestures are resorted to. Fancy the ownership of a dog passing from one to the other of two such persons, without the purchaser ever having seen the animal in the field; or suppose the gentleman who has carefully broken his dog sells him to a person who has but little experience in the field? In the first instance dissatisfaction will very likely be expressed, and in the latter the former owner will be charged with misrepresentation and dishonesty. We are satisfied with what a person relates of his exploits with dog and gun; see for yourself if he is capable of appreciating the working of the animal you wish to dispose of—using a vulgar expression, make him show his hand. There are but few persons who have ever sold field dogs but who have been at some time charged by purchasers with misrepresentation. Such will continue to be the case until breeders are more careful to whom they sell. After all, one sportsman should always be able to recognize another, few moments' conversation, whether his companion is a mere novice or a man of experience in such matters.—HONEB.

PENNSYLVANIA FIELD TRIALS.—At a meeting of the Pennsylvania State Field Trials Association, which will be held at Pittsburgh (Feb. 28 to March 10), the following amendments will be considered and action upon them taken:

Amendment to by-laws, offered by William A. McIntosh, Feb. 24, 1881: Strike out sections 1 and 2 of Article X., and insert as follows, viz:

SEC. 1.—A dog to be eligible to run in the field trials of the Association must be owned by a member of the Association at the time of making the entry and at the time of running the trials. In all cases dogs must be handled by their owners. Nothing in this shall be construed so as to prevent a member from purchasing a dog previously entered and handling him in the trials.

SEC. 2.—The stakes to be run shall be a Derby, and an All-Aged stake, both to be open to pointers and setters only. The Derby stake shall be open to dogs whelped on or after the first day of January of the previous year. Entries for the Derby stake of the year 1881 shall close on the first day of September, 1881, and entries for the Derby stake of any subsequent year shall close on the first day of April of the year the stake is to be run for. The All-Aged stake shall be open to dogs of any age.

SEC. 3.—There shall be no cash prizes offered in either stake, but all prizes shall be of the nature of trophies. There shall be a first, second and third prize offered in each stake. The entry fee, forfeit, value and nature of prizes, time of closing entries for All-Aged stake, time and place of holding trials, as well as details pertaining thereto, shall be determined by the Executive Committee.

By Edward Gregg, of Oxford.—Amendment to Act VII. Sec. 4.—No persons not residents of the State of Pennsylvania shall be eligible to active membership.

By Edward Gregg.—Resolved that this association shall have three stakes in future trials, viz., Derby, All-Aged and Association Stakes, and that the Derby and All-Aged shall be open to the world.

NEW YORK DOG SHOW.—As already noticed in these columns, the office of the show has been opened at No. 138 Fulton street, this city. Superintendent Lincoln says that he has received up to the present time a number of applications from intending exhibitors greatly in excess to that for the corresponding period in any former year, and that he will leave no stone unturned to secure the largest number of entries ever made in this country or in England. Among the entries, Mr. F. Sherwood, of Garrisons, N. Y., has entered three straight-legged beagle puppies, recently imported from the Rock Ferry Pack, Cheshire, England. Letters have been received from the Old Colony R. R., Providence and Stonington Line, Pennsylvania R. R., Erie Railway, Delaware, Lackawanna and Western R. R., New Jersey Midland, R. R., Long Island R. R., New Jersey R. R. and New York and Great Western of Canada R. R. companies agreeing to carry dogs intended for exhibition free both ways when accompanied by owners or representatives. All the other transportation lines are expected to offer the same liberal accommodations, and arrangements are being made with the express companies to carry dogs to the show on prepayment of their usual rates and return the animals free. As yet, nothing is known officially who the judges will be; but the announcement will be made, we are told, at an early date. Two extra classes have been added to the premium list—one for beagle puppies and one for collie puppies—thus making 95 classes in all.

A CANINE GOLGOTHA.—A correspondent of the *Live Stock Journal* writes from Paris:—"I paid a visit the other day to a very curious establishment, know as the 'Fourriere.' It is a large barn-like building, not far from the river Seine, and close to the large wine market—and it is here that are brought, and, in nine cases out of ten, destroyed, all the stray dogs picked up by the police in Paris. In the body of the building are numbers of vehicles which have been abandoned in the streets, and upon one side is a stable for the horses which have been harnessed to them. Most of these vehicles have been abandoned by their drivers while under the influence of drink, or have been taken possession of by the police to prevent accidents. They, however, do not remain long without being claimed, and the same may be said of the many other animals which are from time to time brought to the Fourriere. Cattle, sheep, poultry, etc., are often found straying, and if they are not claimed within a week they are sold, and the proceeds handed over to the State. Even monkeys and parrots have occasionally been brought there, and I may add that the charge for keep is fixed by the Prefect of Police for all animals claimed by their owners.

"My main object, however, in visiting the Fourreire was to inspect the kennels and ascertain what was done with the lost dogs picked up in the streets. The statistics are not very pleasant reading for those who love dogs, as I find that last year 4,563 were brought to the Fourreire, and that only 43 were claimed by their owners. All the others were killed, for the Administration has given up selling the unclaimed dogs, several disputes having arisen when they were recognized by their former owners. The kennels are ranged along the wall, each one having a wire frame in front, so that people who come to look for a dog may have no difficulty in passing an inspection, but they need be very quick about it, for only twenty-four hours are allowed to elapse between the arrival of the dog and his dispatch, unless of course there is something on his collar by which he can be identified. This is too short a time, in my opinion, in a city like Paris, and there is no reason why the dogs should not be kept a week, as used to be the case. It is only within the last few weeks, moreover, that the mode of dispatch has been changed, for up to the other day it was the practice to hang the dogs up with a piece of cord, and literally beat their brains out! They are now spared this horrible death, and are placed in a large wooden box, fitted with a gas apparatus, which ends their sorrows in a very short time. They do not seem to suffer very much judging by their attitude when the bodies are taken out; and this box will hold as many as twenty-five dogs at a time. They seem to have a presentiment of their fate, for those which I saw put to death trembled very much, though the fact of their being brought to a strange place, and kept without food—for they are not even allowed to have a last meal—is enough to account for that. Their bodies are sold for threepence each, the buyer keeping the skin for the tanner, and boiling down the body for the grease, which is sold to the railway companies. To such ignoble uses does many a Paris pet dog come."

NATIONAL AMERICAN FIELD TRIAL DERBY.—The following entrees have been made up to February 28 for the second annual Derby:

Captain Patrick Henry enters Buckel, lemon and white setter puppy, out of Cammie (Gladstone-Buck, Jun.) by Pride of the South. Captain Patrick Henry enters Adair, black and white setter bitch puppy, out of Cammie, by Pride of the South. Mr. P. H. Bryson enters London, blue Belton setter dog puppy, out of Clip (Leicester-Dart), by Gladstone. Mr. P. H. Bryson enters Memphis, blue Belton setter dog puppy, out of Juno (Rake-Fanny), by Gladstone. Mr. D. Bryson enters Bessie T., black, white and tan setter bitch puppy, out of Floy (Rob Roy-Blanche), by Gladstone. Montview Kennel enters Gilda, blue Belton setter bitch puppy, out of Floy (Rob Roy-Blanche), by Gladstone. JOSEPH H. DEW,
Columbia, Tenn. Secretary N. A. K. C.

NATIONAL AMERICAN KENNEL CLUB'S STUD BOOK.—The entry-fee for single registry to the stud book is twenty-five cents and the annual dues, now payable, of members to the N. A. K. Club is five dollars. We learn from Mr. Jos. H. Dew, the Secretary of the Club, whose address is Columbia, Tenn., that he is overwhelmed with letters of inquiry. We therefore would suggest to the sporting world that as the secretaryship of the organization is an onerous one, from which the Secretary receives no emolument, it would be no more than courteous to assist him in the compilation of the stud book by sending in their entries in a proper form, which is substantially as follows: 1, name of breed; 2, name of dog; 3, name of owner; 4, residence of owner; 5, breeder's name; 6, when whelped; 7, color of dog; 8, pedigree.

THE COCKER CLUB—Chicago.—Till you have the kindness to inform me when the meeting of the Cocker Club was held at which A. H. Moore was elected President? As one of the Committee, I have never been advised of the meeting, and object to the judgments either in officers or a standard. J. H. WHITMAN.

We have had no information of a meeting of the Cocker Club, but we were told that the members of the Committee had conferred by letter and that as a result of this correspondence the officers named in our last issue had been elected. We simply gave this report, which had come to us, for what it was worth; and have since received a letter from Mr. J. Otis Fellows, from which it appears that the gentleman named last week as the elected President received four of six votes for that office, and the Secretary named five of six votes for that office. We deprecate, as much as does our correspondent, any "snap judgment;" but if the Cocker Club Committee, which was announced three weeks ago, have not yet organized, it strikes us that they are wasting valuable time.

INTERNAL CANKER OF THE EAR.—Luzerne, Feb. 26—*Editor Forest and Stream:* Seeing a great many readers of your valuable paper inquire about canker in a dog's ear, and seeing different remedies given, I would like to have you publish the following simple remedy which I accidentally discovered several years ago: Seeing a young hound of mine holding his head on one side and keep scratching his ear, I examined it, and soon found it all inflamed of canker. Having nothing handier, I took a small oil can with common black lubricating oil and moistened the inside of the ear thoroughly; it relieved the dog instantly and in twenty-four hours he was entirely cured. I have since used it many times and always with the same result.—FRED ROIDER.

[The inflammation may have been caused by the dog's scratching to remove a flea or some foreign substance. Nine-tenths of the cases reported to us have assumed a chronic character and require a much more severe treatment.]

NOTES FROM ABROAD.—There has been rectification of date for the Hanover Dog Show. A letter to the *London Field* is as follows: "The Great International Dog Show to be held at Hanover, will take place in 1882, (not this year, as announced,) on account of an Agricultural Exhibition, which taking place this summer would clash with the Dog Show." Mr. Emil Meyer, the Secretary, states confidently that the Hanover 1882 Dog Show will surpass all former exhibitions on the Continent. He adds that the preparations for the said show have already been commenced, and that room will be provided for 2,000 dogs.

The "British Lion" is dead! Not all men tremble! He was only a dog—a mastiff, yet supposed to be the biggest of his breed ever known. He weighed just fourteen stones of fourteen pounds each, (196 pounds). The chief honors this dog won were—first prize at Nottingham; third, Crystal Palace, etc.—SIRIUS, *in the Stock Keeper.*

A CAT GOURMAND.—Whitehall, N. Y.—While writing I would like to ask you if you ever heard of a dog that would kill and eat a cat? There is one here that is half pointer and half spaniel that has killed and eaten three, at least. The above can be verified by at least six persons. C. McV. T.

See answer to M. O. S., in Kennel Management. Feb. 24. The cat destroyer and gourmand, of which you write, which we understand is a pure cross between a pointer and spaniel is a most valuable production. Would that there were more of this breed spread broadcast throughout the land. Had we such a treasurer in our backyard o' nights we would consider him a bootjack economist of the first water. Moreover, he would unquestionably pay for himself in china, hair brushes and toilet soap the first month of his engagement.

AMERICAN EXHIBITORS ABROAD.—Whether the New York Show of this year will have many entries from across the water at this time it is impossible to state, from a private letter we learn that Mr. Dalziel is willing to make all arrangements with foreign exhibitors and aid them with his experience. Here arises the question. Will American dog owners at an early date try for some of the glory and prizes on the other side? We believe that there are many dogs now in this country that would hold their own in any company on the bench; and we would not be surprised to see several of our best kennels represented, and successful, too, before many years have gone over our heads. American bred horses have won far beyond the expectation of their owners during the past twelve months, and there is no reason why our dogs should not win in an international field trial. Why not have an international field trials?

"THE MERRIE LITTLE BEAGLE."—Evansville, Ind., Feb. 28.—I am glad to know that you are working for the beagle. I think by offering special prizes you will engender a permanent interest. The articles of Elmore and also of Pownall were splendid. Will they not write more on the subject? I have killed deer, turkeys, quail and prairie chickens, in fact, most of the different varieties of game found in Illinois and Indiana, but the sport *par excellence* is the fox-chase, not with guns, as many people describe in your excellent journal, but with hounds. Now, unfortunately, my professional cares do not permit of a fox-chase, as in my younger days, hence I will keep a small pack of beagles and run hares, as the best substitute for that royal pastime, the fox-chase.—G. F. CENTER, M. D.

OLD-TIME POINTERS—Columbus, O., Feb. 19—*Editor Forest and Stream:* I have been a reader of FOREST AND STREAM for a long time and have never yet troubled you, although strongly tempted to indorse the views of a gentleman from the South who in a few numbers back condemned the race of setters, root and branch, in no doubtful terms, and longed for the old-time, wiry-haired, heavy-set pointer. His experience has been mine. Like him I have owned the blues of three litters with pedigrees as long as a man's arm, yet, with all their pride of ancestry, I have been doomed to disappointment and still look for the old-time pointer.—COLUMBUS.

ENTRY BLANKS FOR THE STUD BOOK and the Second Annual Field Trial Derby will be mailed as soon as they are printed. Mr. Charles De Rouge, the late Secretary of the National American Kennel Club, has the matter in charge and expects to forward the blanks to Mr. Dew within a short time. Mr. Dew desires us to notify the public of the reason why the blanks have not been distributed and state that no legitimate entry will be barred for this reason.

MR. SNELLENBURG'S LAVERACKS.—In another column we notice the purchase by Mr. A. H. Moore, of Philadelphia, of Mr. Snellenburg's Thunder and Lady Laverack, and that of Daisy Laverack by Mr. J. H. Goodsell, of this city. Mr. Snellenburg writes us: "Since I put my advertisement in your paper I could have sold one hundred Laverack dogs, if the letters I have received are any indication." To this we would say, that careful and intelligent breeders like Mr. Snellenburg will never find it difficult to procure their price when they can offer such remarkably fine stock as the above named dogs.

MORTALITY OF STOCK.—Letters from almost all sections of the country advise us of the almost unprecedented mortality of stock during the past winter. Not only have the young dogs suffered, but many of the old and tried companions in the field have galloped off to other "happy hunting grounds." Mr. Kelly, who has charge of the Baltimore Kennel Club, writes that from what he can learn nine-tenths of the young dogs shown at the Pittsburgh show have since died of distemper.

A FINE BULL TERRIER.—Mr. John Wills, of this city, has received from our friend, Mr. Hugh Dalziel, the present of a very promising bull terrier puppy, seven months old, pure white in color Young Victor, as the youngster is called, was bred by Mr. R. J. Hartley, Bowdon, of Cheshire, England, who owns the best kennel of bull terriers in the world. Young Victor is out of Champion Violet (E. K. C. S. B., 7636) by Young Turk (E. K. C. S. B., 6599). We congratulate Mr. Wills on his good luck.

KENNEL MANAGEMENT.

89 CANANDAIGUA.—I had a cocker spaniel about six months old. He seemed to have taken cold; at first he acted stiff and dumpish; eyes looked somewhat red, but still bright; did not seem inclined to eat much for a few days. Then he commenced having fits of shivering, no matter in how warm a place. These shivering fits gradually became more frequent until after ten days or two weeks I first noticed anything wrong with him; then he began to run a little at the eyes—very little—and could be seen to drink anything but water. I have been treating him for distemper; but he gradually became worse, shivering all the time, although I kept him in a warm room night and day. His head seemed very hot and throbbed very violently on top—you could see and hear it throb. His nose did not run exactly, although the nostrils seemed to fill up and impede the breathing, which was very much labored. All this time for about eight or nine days he would eat nothing, although he did not seem to waste very fast. Still he grew weak and seemed to have great difficulty in breathing. He would have spells of getting up and trotting around the room from one side to the other until the last day, when he could not get up. He did not cry, but still seemed to be in great pain, and finally died. I treated him for the distemper, and supposed he had distemper fits. The last day when I went to him in the morning he raised up his head and snapped at me and struggled a few seconds but could not get up. The night before he died, while moving around the room, he turned around and snapped his jaws once. I was expecting that other until the last day, when he could not get up. He did not cry, but still seemed to be in great pain, and finally died. I treated him for the distemper, and supposed he had distemper fits. The last day when I went to him in the morning he raised up his head and snapped at me and struggled a few seconds but could not get up. The night before he died, while moving around the room, he turned around and snapped his jaws once. I was expecting that other dog would die next

Each team shot on paper targets, and exchanged the same by express to verify count, etc. Our club have maintained their previous record by winning the match, having never yet been defeated, though they do not feel that this state of affairs can always exist. This is their ninth victory within a year. A challenge has been received from the Rod and Gun Club to shoot again on March 12 and will probably be accepted. Below are the individual scores:

Wheeling Rifle Club Match.

Otto Jaeger	8	11	10	9	11	12	11	12	11	10—104
C. E. Dwight	10	11	11	9	9	9	12	12	10	10—103
R. S. Stewart	11	11	11	10	10	10	10	8	8	8—99
J. F. Shirk	9	7	12	11	8	10	9	10	9	12—97
R. H. Babcock	9	10	7	11	11	8	8	9	11	8—92
Wm. Cox	8	8	10	11	9	9	9	7	10	10—91-831

Springfield Rod and Gun Club Team.

Bumstead	10	12	10	10	12	12	10	12	11	11—116
Cooley	12	9	12	12	12	0	8	11	10	8—102
Young	12	11	9	11	7	9	11	10	8	10—98
Ames	11	12	10	8	9	11	8	8	9	9—94

Mayott	11	11	9	9	8	9	10	5	8	6—86-831

MAMMOTH RIFLE GALLERY.—Boston, March 4.—The following are the prize winners for the month of February in Everybody's Rifle Match:

E F Richardson.....38 38 39 39 38—193 J H Williams.....37 37 37 37 37—185
J Merrill.....38 38 38 39 38—192 J Ames.....36 36 37 37 37—183
N W Arnold.....37 38 38 39 39—191 J Warren.....36 36 36 36 36—180

Silverware Match.

G Warren.....37 37 38 38 39—189 E L Armstrong..36 36 36 37 37—182
E Brown.....37 37 37 37 38—186

Pistol Match.

Elihu Wilder.....38 38 38—114 J Ames.....36 36 37—109
F J Habbeth.....37 37 37—111

In the pistol match for the month of March the Massachusetts Target will be used. Conditions—Rounds 5, possible 90; three scores to win or a possible 288. There have already been some fine scores made by the several participants. The following are some of the best:

J H Williams.....61 62 63—186 G Warren.....54 59 60—173
Elihu Wilder.....67 59 61—187 Allen P Kelley.....57 59 63—179

In the amateur badge match, for an elegant silver badge and three cash prizes, there has been a number from the bullseye then Mr. Wickham. There was but the eighth of an inch difference between the measurement of the two respective shots. To decide a championship by such a small difference illustrates the extreme closeness of the contest. Owing to absence from the city, this is Mr. Wickham's first appearance in the arena. He is considered one of the best shots of the city. The competitions for the week ending March 12 will be for the championship of swinging bullets, ¾ inches, at 7 yards.

At the New York Rifle Gallery during March $50 will be given in prizes. In the February Match the winners were as follows:

W M Farrow.....48 48 47 49—192 P G Fenning.....48 48 47 48—191
W Hayes.....48 48 48 48—192 G Joiner.....47 47 48 48 190

In the match for March, conditions, open to all comers, weapon any 22 cal. rifle, 3 lbs. pull, 5 rounds, on 25-ring target, distance 25 yds., entrance 25 cts., one score to count, possible 125, marksmen at liberty to use their own rifles and ammunition, ties to be shot off. The leading scored to date are as follows:

W Hayes.....114 H Obet.....106
Col Riggs.....112 E Burg.....103
F S Hutchinson.....111 M Dorrier.....102
P G Fenning.....108

ALBANY, N. Y., March 3.—A very enjoyable match closed to-day on the Kensselaerwyck range. The match in question was started at the close of the regular shooting season last fall, when an enthusiastic lover of rifle shooting, wishing that the practice should be continued during the winter months, offered a gold medal to be shot for at 300 yards, and open to all comers. The match proved to be popular with the small-bore men, and some of the military men were frequently found among the competitors. This afternoon the riflemen repaired to Rensselaerwyck to shoot the ninth competition. The weather was fair, though the light was not of the best. The keen eyesight and steady nerve of the men were noticeable in the opening rounds, and the scores made were of the best kind. The match was won by Capt. Fitch, with a score of 41 out of a possible 50. There have been nine competitions, three of which have been won by Mr. L. Geiger, of Hudson, one by Lieut. B. R. Speiman and five by Capt. Fitch, and none of the winners have made less than 41 points. The following are the leading scores in detail to-day:

Fitch, Bal. S..5 4 5 5 4 5 5 5 5 5—46 Geiger, R. S..4 5 4 4 4 5 5 4 5 4—44
Dexter, S. S..5 4 4 4 5 5 4 5 5 5—45 Sanders, Hep. S.5 5 5 3 4 5 4 5 4 5—43
Charles, Bal.S.5 4 4 5 4 4 4 5 5 5—41 Miles, S. M....3 5 5 4 4 4 5 5 4 4—39

Next Thursday afternoon there will be a subscription match at 200 yards, seven shots, military rifles allowed two points; and should the weather prove favorable, there will probably be a match at 200 yards.

NEW ORLEANS, Feb. 28.—The third and concluding day's shooting at Frogmoor to-day proved quite interesting. The day was a favorable one, and, save for the wind which prevailed, was just what suited the shooters. In several instances, however, the dying birds were carried out of bounds by the breeze. Pools were sold on the grounds, but the betting was rather of a subdued order, and no large amounts were realized. The summary of the day's shooting is as follows:

First match—Ten single rises, 21 yards:

Franklin	7	Hewes	6
Stumpf	7	Young	5
Chaudet	7	Da Ponta	5
Tunstall	6	Schaeffer	5
Cousin	6	Bush	5
Le Breton	6	Sessuns	5
Jones	6	Johnston	5
Stude	6	Williams	5
Scales	6	Mason	4
Muck	6	Carre	4
Sheets	6	Nance	3
Shaw	6	Hunt	3

In shooting off the ties, 26 yards, Mr. Stumpf won the first prize, killing 8; Mr. Johnston the second, 6; Mr. Da Ponta the third, 3.

Second match—Seven single rises, 21 yards:

Shaw	7	Young	5
Cousin	7	Mason	5
Sessuns	7	Stumpf, Jr	5
Tunstall	6	Le Breton	6
Nance	6	Franklin	4
Bush	6	Franklin	4
Hewes	6	James	4
Schaeffer	6	Scales	3
Chaudet	6	Sheets	3
Hunt	5		

The ties were then shot off, and Mr. Cousin won the first prize, scoring 5; Mr. Chaudet the second, 6; Mr. Jones the third, 8.

Third match—Double rises, 31 yards; both barrels, misses and out. The contest finally narrowed itself down to Messrs. Hughes, Tunstall, Le Breton and Bush, who were tied for the first prize, and who divided the money.

Fourth match—Bats; three double rises, 18 yards:

Hughes	6	Cousin	3
Chaudet	6	Tunstall	3
Miles	5	Recks	3
Young	5	Bush	3
Le breton	5	Mason	3
Sessuns	4	Sheets	2
Scales	4	Jones	2
Fort	3	Nance	2
Johnson	3		

The prize was divided between Chaudet and Hughes, who were tied for the first place.

First match—Glass balls, 18 yards rise; after the first fire miss and out. Miles and Hughes made a clean score of 10 for the first prize The tie resulted: Hughes, 3; Miles, 2. Le Breton won the second prize by a score of 9, and Cousin third, scoring 8.

On the opposite side of the bayou were ranged a number of the residents of the vicinity, who, armed with guns of every conceivable description, made short shrift of every luckless bird that escaped the pellets of the marksmen within the grounds.

JAMESTOWN, N. Y.—We are much interested here in looking over the reports in your paper or rifle shooting, as we are doing some gallery work here which is not so very poor for learners. The other evening, at the regular shooting off ties at 43 ft., some pretty good work was done, which I promised to send you an account of for publication. The creedmoor target, proper reduced from 200 yards; rounds 4, possible 20. The best scores were: F. K. Bowler, 20; E. J. Ralph, 20; H. S. Starr, 19; E. J. Blakesley, 19. At the close of the shooting Mr. Bowler said he would make one more full score, and he did make one. B.

FRELINGHUYSEN RIFLE ASSOCIATION.—Newark, March 1.—In the monthly shoot for the association badge, which took place on Tuesday evening at the range of the Frelinghuysen's, 18 Market street, we give the best scores of members:

Geo D Weigman.....46 A C Neumann.....44
Chas T Drake.....46 H Westermann.....45
Adam Rose.....44 W F Lauer.....41

In shooting off the ties Mr Weigman won the badge. The association now numbers forty men and is rapidly increasing. The shooting during the past six months is considered fine. During the coming season we intend taking up pistol practice on a range 40 feet, and we see no reason why we cannot become proficient in the same.

AN UNEXPLAINED ACCIDENT—Saco, Me., Feb. 28—*Editor Forest and Stream:* Six weeks ago I was reloading shells for Springfield musket, cal. .45, using reloading tools made for the U. S. Cartridge Co. of Lowell, Mass., when a cartridge exploded in the reloading tools, blowing the flesh from second finger of left hand to the bone. The manufacturers of these tools claim that no power on earth can explode a cartridge in their tools unless something strikes against the primer. I inclose letter from them. I had sixteen shells to load. First I primed every shell, then put the capping-punch in the box on the table; after that commenced to load. Had loaded ten and was driving ball home by striking on the ball-cutter when the eleventh exploded. I was loading with the safety-block resting on a small piece of hard wood laid across my knees, and I am positively sure that neither the capping-punch nor any foreign substance could have been the means of exploding the cartridge. Now, will you oblige me by answering in your correspondents' columns if you ever heard of a case of this kind? If it is possible to explode a cartridge by concussion caused by blows upon the ball centre? If not exploded by concussion, what did cause the explosion? W. F. CUMMINGS.

[The accident is certainly an exceptional one, and can only be satisfactorily explained on the fact of a foreign substance getting under the cap, or else the leaving in place of the capping-punch. Certain it is that the arrangements have been used thousands of times at all posts of the U. S. Army, and a similar accident has not come to our ears.—ED. F. & S.]

THE TRAP.

COMMUNICATION.—*Editor Forest and Stream:* I wish you would grant me a little space for a statement of facts which may interest some of your sporting readers. On the 25th and 26th of last August, Mr Ira A. Paine, the noted wing shot, held a two-days' pigeon and glass ball shoot at this place. As pigeon shooting is a direct violation of the statute in this State, I called public attention to that fact through the local press. In this way I hoped Mr. Paine might be induced to change the programme and have simply a glass ball tournament. A controversy sprang up between Mr. Paine and myself, which ran through the daily press something like a week, in which I presented the humane considerations against the practice, and he used the arguments generally brought forward in behalf of the sport. In the course of the discussion Mr. Paine laid great emphasis on the benefit to the cause of his class of shooting, and what great things they were always doing in the way of practical charity, etc., and represented the anti-cruelty people as being generally close-fisted and lacking in sympathy for human kind. Seeing he was anxious to have it understood that his generosity was unbounded, I remarked, in my last communication I suggested that the Home for the Friendless was a worthy institution and very much in need of funds.

The shoot came off, and, though the attendance was small, I understand that Mr. P. made some money. Then he had arranged for a tournament in Saginaw City, only two miles away, and was here altogether ten days or more. The attitude of benevolence which he had struck had to be maintained in some way till he had "done" the Saginaw people, and then his generosity was somewhat remarkable. He sent an order on the manufacturers for 1,000 of his feather-filled glass balls, the actual price of which was $18, and gave to me for the Home for the Friendless. I got it indorsed by the president of that institution, and started over to the Saginaw Kindler, our leading dealer in sporting apparatus, and, by the way, a gentlemen. Mr K. sent it direct to the Bohemian Glass Works, Pearl street, N. Y. After waiting two or more weeks without hearing from the order, I wrote to the Bohemian Works, and received a postal saying that they had been delayed by the manufacturers, but would forward the balls as soon as possible. After waiting about a month longer I wrote again, and received a polite note regretting the delay, and saying that the balls would be sent *immediately*, emphasizing Kindler, our leading dealer in Saginaw, who had ordered the balls for me. I have. The

SEAWANHAKA YACHT CLUB.

WE have only a few words to offer at present concerning the decision of the club at the meeting last Monday to build a house as headquarters. It is proposed to lease Manning's Basin below the first or Quarantine landing on Staten Island and to erect a handsome structure on the breakwater. A corporation inside the club is to be formed and will build a two-story house and lease the same to the club, a plan which has been successfully adopted by others. The location selected is simply the best in New York harbor, and the action of the club a most commendable one, certain to concentrate the sailing and to contribute solidarity of the metropolis as they have never been before. Rapid transit to and on Staten Island is only a question of time and the value of the club property is certain to become greatly enhanced in coming years, and to those who have been instrumental in instituting the plan the members and yachtsmen generally will owe a debt of gratitude certain to be appreciated in the near future. As the scheme was unanimously adopted after full discussion the success of the step is assured. At the same meeting Mr. John F. Lovejoy was elected a member.

CUTTERS IN BOSTON.

WHEN FOREST AND STREAM started the crusade against sailing machines and brought the "reality" into prominence perhaps before the public only two short years ago, we had but few followers and the violent opponents and doubting Thomases included 999 out of every 1,000 yachtsmen in America. But in two short years how things have changed! The honest little cruising craft and keel cutters have gained for themselves a name and reputation which insures for their type a permanent life in our fleet. Who will still maintain in face of the evidence that this journal has not through it own tireless efforts in behalf of the cutter and the sailor yachtsman fairly earned the long lead it has taken as the organ of the sport in America? says the Boston *Herald*:

"Lawley & Sons have laid the keels for two more English cutters. They appear to be gaining favor with gentlemen yachtsmen and these two will make four cutters, when they are completed, that this firm has turned out. They all measure 30 ft. on the water line and 35 ft. over all. The keels and frames are of prime white oak and they are made to withstand all kinds of weather. Fastened to each keel are 5,000 lbs. of iron to ballast them ready and to enable a large spread of canvas to be carried with ease."

And we add this is but the beginning of the reform.

A FUNNY RULE OF MEASUREMENT.

SOONER or later length measurement leads into the ridiculous. Mr. Robert W. Bibber, yacht builder at City Point, Boston, deserves the credit for seeing his way clear to the end of the rule, and this is the consequence: A new cat-boat, 26 ft. on keel, 20 ft. beam, and 4 ft. draft with an iron keel of 100 lbs. and 2,100 lbs. inside, mast 36 ft. and a boom of 34 ft. Sail to contain 160 yards, equal to about 600 square ft. Well, did you ever! And how will that rest of the cat-boat fleet of the same length like such a customer? And how long before even the dullest reasoning powers will comprehend the fallacy and the tendency of such a simpleton's measurement as length? Perhaps, without knowing it, Bibber will create a bigger reform with his new wash bowl than pages of ink spilt in FOREST AND STREAM. And then for another "revolution" we have been fighting for in the way of a rule for measurement with a little brains in it in. Paddy, at our elbow, wants to know when yachts become broader than they are long, will the breadth become their length, and will such yachts be sailing sideways when they are sailing ahead?

YACHTING NEWS.

STEPHENS' CANOES.—Mr. Stephens, of Rahway, N. J., has just issued his new catalogue for this year. The little pamphlet is a very useful guide to canoeists, inasmuch as it gives full directions for selecting the type of canoe according to varying wants, and also specific descriptions of the canoes of his make, including his well-known Jersey Blue for paddling and sailing, his racing Kill Von Kull and cruising Sandy Hook. The catalogue contains valuable information on all matters concerning the sport, the feature being a lithographic plate showing the lines and sail plans of a great variety of canoes, including a remarkable little cat boat of 10 ft. length, designed by H. W. Eaton. Mr. Stephens also proposes to make a specialty of building small cruising craft similar to those recently published in these columns, and is prepared to furnish estimates.

WITHOUT AN EQUAL.—An advertiser writes that a recent mail brought him twenty-five letters in a bunch, and that a late edition of 10,000 catalogues will not last him a great while. As an advertising medium to boat and yacht builders FOREST AND STREAM has a very long lead.

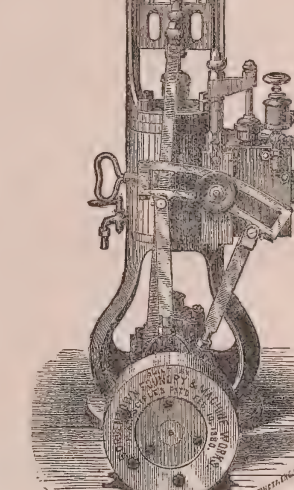
BUFFALO YACHT CLUB.—*Editor Forest and Stream:* Your two-toner is likely to create quite a revolution among small boats on the lakes, as several of my friends will build from your lines. If I could sell my light draft for half the cost would follow suit. Yachts here are being stripped of their winter housing and operations for the spring are under way.—PENNANT.

YACHTS' STOVES.—*Editor Forest and Stream:* I have noticed some queries and answers relative to stoves. Now, I have had pretty good results with a Florence coal-oil stove. The company manufactures a galvanized one especially for boats that won't rust, and it will cook first rate. It won't stink if you use good oil, and it will heat a cabin the size you have designed so as to be very comfortable on a cold day. I have tried the Florence in a large yacht on Chesapeake Bay in the winter and found it warm enough. The oil will not slop over if you have a sort of funnel attached. Let it fit tight, about half the height of the cooking drum, or else fill the reservoir well with cotton. But a better stove is certainly needed.—PORT LYTE.

YACHTS FOR SALE.—Attention is called to yachts wanted and offered for sale through the columns of this journal. Besides the yachting public throughout the country, it is the best medium for buying and selling by advertisement.

DEEP DRAFT.—*Editor Forest and Stream:* You are quite right about our Eastern sloops drawing more water than English cutters, which shows the objections to the draft of the latter to be a bug-a-boo, pure and simple. In fact, they are merging the cutter and sloop under very fast in all respects, save perhaps in the matter of outline, which is governed by fancy and fashion, and changes with the times. The modern Boston sloop is nothing else than a beamy cutter in principle. The keen drag of the keel is all that carries an immense sail plan. I cite the Gem for extreme lateral resistance. She is an average runner, but a dark horse to windward. She can eat the best centre-board sloop of her size out of the wind to-day, and what she lacks in speed she will make up in getting to windward. Her metal ballast is only 2½ ft. Yacht building here has gradually been undergoing a change, almost unknown to ourselves. From the flat bottom centre-board sloop we have evolved the depth, the rocker keel, the outside ballast and the double-head rig, all distinguishing features of the cutter. Even in minor matters—the lead of gear, the introduction of iron floors, and, of late, even hush decks in yachts under 40 ft.—we have been steadily approximating the "honest boat" represented by the cutter of fair beam, with rig slightly simplified, and your journal must be credited with a powerful influence in bringing about the healthy change.—S.

LIGHTS AND RED TAPE.—Authority from Washington having decreed that all boats propelled by oars are to carry lights after sundown without exception, the Treasury Department has forwarded us a printed circular to that effect. As the rule is absurd, impracticable, the yachting public throughout the country, it is the best medium for buying and selling by advertisement.



DEEP DRAFT.—*Editor Forest and Stream:* You are quite right about our Eastern sloops drawing more water than English cutters, which shows the objections to the draft of the latter to be a bug-a-boo, pure and simple. In fact, they are merging the cutter and sloop under very fast in all respects, save perhaps in the matter of outline, which is governed by fancy and fashion, and changes with the times. The modern Boston sloop is nothing else than a beamy cutter in principle. The keen drag of the keel is all that carries an immense sail plan. I cite the Gem for extreme lateral resistance. She is an average runner, but a dark horse to windward. She can eat the best centre-board sloop of her size out of the wind to-day, and what she lacks in speed she will make up in getting to windward. Her metal ballast is only 2½ ft. Yacht building here has gradually been undergoing a change, almost unknown to ourselves. THE SCIPLE YACHT ENGINE.

NOT many years ago Bordentown, N. J., was in a fair way to achieve for itself a name in the nautical world as the home of high speed steam yachts. An enterprising firm had located on the river front, bought a fine lot of tools, and at one time seemed on the highroad to success. They had in their yard three vessels on the stocks, all of iron, the Continental, Miranda and St. George, which gave a good account of themselves when put over the measured mile. But the "hard times" came along; people no longer wanted high speeds, and the firm dissolved and for a time Bordentown ceased to concern itself about the pleasure navy. Since those days, however, the old town has emerged from her temporary eclipse, and once more are the blows of the hammer resound along the banks of the Delaware, as the riveter heads up the red-hot rivets in the shell of a boiler, and the caiker drives the cotton home in the well-fashioned hull of new steam yachts. The Bordentown Foundry, one of the oldest establishments of the kind in the country, long and favorably known to the iron world, has been devoting much attention of late to building yachts for speed and sporting purposes, and, judging from the favorable indorsements sent us, their work leaves nothing to be desired in

the way of soundness or of finish. They furnish their yachts with an engine specially adapted for the purpose, and different in design from all others, as the accompanying illustration serves to explain. The engine is built under Sciple's patent, and, in the arrangement of the guides and connecting rods, bears resemblance to the steeple engine, securing the necessary length of stroke with a low cylinder, light weight of frame and long connecting rod. The reversing and valve gear is of the simplest and strongest kind, and all the working parts can readily be got at without danger while running. The workmanship throughout is of the highest class, and the engines run smoothly from the first opening of the throttle. The thrust bearing has steel and brass rings to take the friction, and stuffing box and steam bearing have brass bushings. Concerning the boilers turned out by the same concern, little really need be said in the way of recommendation, as the firm has been too long in the business to require indorsement as to quality of work at our hands. We give an illustration of the type adopted by them for yachts. They raise steam rapidly, owing to large area of heating surface and excellent draft; and, what is of great importance in high speeds, they also make steam rapidly and supply nearly a steady pressure, owing to the large steam dome attached. The weak point of nine boilers out of ten is that they cannot make steam as fast as the engine will take it for any length of time, and the gauge runs down on the run. Hence it is easy to make a high record for a single short spurt, but which cannot be maintained with the throttle wide open, unless you have the steam to back you. Of all the shell boilers, those built by the Bordentown Foundry give most satisfaction in this respect, as they are the result of considerable study and long experience. In a yacht lately built for the Zip Yachting Club of Philadelphia, the hull was built of red cedar, 30 ft. keel, 7 ft. beam and 4 ft. deep, decked with ⅝ in. stuff, and joinerwork of handsome design and finish. Engine, 6x6 in., shaft, 1⅞ in. steel, 14 ft. long; propeller, 33 in. diameter and 6 ft. 9 in. pitch, turning up to 300. The boiler is of the "dog-house" type, 36 in. face, 36 in. high and 48 in. long, with a dome 20x20 and supplied with fifty 2 in. tubes, 40 in. long, giving a total of 130 square feet heating surface and very economical evaporation. The boiler holds fifty gallons of water when the third gauge cock is sotted, and is made of the best flange iron with the true government regulation stamp of 50,000 lbs. tensil strength, besides being thoroughly braced. The speed of this yacht is 16 miles in slack water, and her cost about $1,600. As another example of the Bordentown practice, we will

mention another launch delivered to Diston's Sons of Philadelphia. She is a handsome model, and, in spite of large beam, shows very good speed on trial. Length on keel, 36 ft.; beam, 8 ft.; hold, 3½ ft. The boiler is 36 in. high, 30 in. face, 48 in. long, of the return tubular style, estimated at 12 horse power. When working it holds 48 gallons of water, and the top is barely even with the gunwale of the boat. Other owners speak in high terms of the Sciple engine, and believe it to be one of the very best in the market for reliability and wear. Capt. Joel Griffin, of New Brunswick, N. J., has one running as well as Capt. J. G. Smith, of Baltimore, and both will give ready indorsement to all we have said. The Foundry is now busy with orders for their specialties, but are prepared to furnish estimates for yachts and all their fittings, and turn them out in time for the season.

YACHT BUILDING AT BRISTOL.—Unusual activity is displayed at the Herreshoff works and much yacht work is in hand. The schooner Sadie is about finished and will go into commission in March. She has been entirely rebuilt and the old sloop cannot be recognized except in name. The steamer Camilla, built for Dr. J. G. Holland, will be ready for deliver, in a very short time and a second one, 60 ft. long by 9 ft. beam, very much the same in model and arrangement, will soon be turned over to her owner, Mr. B. J. Clarke, of this city. Still a third one is to be built for Mr. A. N. Morris, also of this city. When this batch of triplets steam in circles around the clumsy productions nearer home the public will begin to think with us that the Herreshoff barries of the paper are the fastest. The Lemoin Leila, well known as the fastest thing of her inches, has been sold to parties in Toledo, Ohio, and will no doubt become a popular craft on Western waters, where her beauty and extraordinary speed are certain to be appreciated. She is to receive what little overhanging she needs, and will cause it to her new destination. The handsome steam launch for a tender to the S. S. Rhoda, Mr. F. Lorillard, is a little gem in beauty and finish, and is to be delivered in a week. She is 30 ft. long. The British admiralty has not been slow to appreciate the Bristol specialties, and is now having built a couple of yiddete boats guaranteed to steam 16 miles. They are only 45 ft. long with 9 ft. beam, and and will have compound engines of 120 H. P. Now the average launch owner imagines he has a boat which can steam 14 to 16 miles, but upon closer investigation 9 to 10 will be about all she really can do, and under very favorable circumstances perhaps 10. When the picket launches of 48 ft. are guaranteed to run 16 miles, or over 18 knots, off the reel it means something, for they are just humming, and very few people can boast of having handled such speed in such small boats. The business of the establishment is growing at such a rate that enlarged facilities are required, and a new machine shop, 60x16 ft., is to be erected at once. The company is building a compound condensing engine for a large 85 ft. steam yacht belonging to Mr. Mark Hopkins, of Detroit, boiler and appurtenances to go with it, and they have in hand a large amount of general work. We notice a continued increase in the size and power of coil boilers furnished, and hope that they will be found equally as serviceable on a large scale as they have proved to be when of moderate power.

WAVE LINES.—*Editor Forest and Stream:* In your last issue I gather from the text that the figures you give for obtaining the radius of the generating circle should have been R divided by R, your compositor having made them appear as 1xR. By dividing the length of the load water line by the figures given the quotient will be the radius required. Thus, in your two tonner, the afterbody is 92 inches long, and placing the type half way between shallow and light, the divisor by the table is 12.48, and this into 92 gives 7.5 for the radius, as shown in your table of details of the previous week.—CYCLON.

PORTLAND YACHT CLUB.—*Editor Forest and Stream:* I send you the result of our recent election of officers: Commodore, Wm. Senter, Jr.; Vice-Commodore, W. W. Goold; Fleet Captain, J. C. Owen; Secretary, Geo. D. Rand; Treasurer, H. R. Virgin; Measurer, J. H. Dyer. Regatta Committee—Wm. Senter, Jr., T. E. Jones, G. W. Rich, I. T. Wyer, F. L. Mosely. The club is prosperous indeed. We have 27 yachts and 155 members, a club house and library, with FOREST AND STREAM among our papers. During the past season 109 foreign yachts put into our harbor, just double the number which visited us the previous year, so you see the attractions of Portland and neighboring waters are being appreciated more and more every year.—R.

HAVERHILL YACHT CLUB.—*Editor Forest and Stream:* The annual meeting was held Wednesday evening, March 2. The club is prospering finely and in point of membership, with prospect or certainty of new boats this season. The annual supper was partaken of after the election of the new board of officers, which were: Commander, E. F. Brown, Josephine; Vice-Commodore, G. W. Simonds, Grace; Fleet Captain, Alfred Warren, Josie J.; Secretary, C. H. Sleep; Treasurer, Geo. D. Ayer; Measurer, H. J. Boane. Regatta Committee—Geo. D. Ayer, A. M. Dusser and E. F. Brown.

NEW BEDFORD YACHT CLUB.—*Editor Forest and Stream:* At the annual meeting the following officers were chosen for the year: Commodore, John A. Hawes; Vice-Commodore, Francis S. Hathaway; Fleet Captain, Edward S. Brown; Secretary, George P. Shockley; Treasurer, David L. Parker; Measurer, Edgar B. Hammond. The list of members foots up 298, which places the N. B. Y. C. among the leaders in America. Receipts for the year $4,834 for dues and fees. Payments for land and club-house were $3,349, and for other purposes $1,750. There is still a debt on the club-house and furniture of $2,200, which it is intended to pay off as fast as possible. The fleet includes thirteen schooners, thirty-four sloops, two steamers and nine cats—a total of eight in all. During the last year 250 yachts put into the harbor, which is becoming more popular every year. The club sailed seven matches last season.—H.

JERSEY CITY YACHT CLUB.—The annual election held at the club rooms, 43 Montgomery st., Jersey City, resulted as follows: Commodore, Geo. L. Winn; Vice-Com., John G. Norburn; Secretary, S. H. Vreeland; Treasurer, G. Edwards; Measurer, C. H. Smith. The finances of the club are on a sound basis, and a fairly active season is anticipated.

FLORIDA YACHT CLUB.—*Editor Forest and Stream:* At the regular meeting of the Florida Yacht Club, of Jacksonville, the following officers were elected for the year: Commodore, Alexander C. Haskell; Vice-Com., M. W. Drew; Captain, A. D. Barnett; Secretary, H. D. Bonnelhan. Board of Trustees; E. M. Randall, J. E. Burhan, H. T. Baya, J. L. Marvin, B. P. Hazeltine. Governing Committee: J. G. Christopher, A. C. Amsber, W. J. Dancie, J. L. Marvin, D. Greenleaf.

HELM.—Several inquires will find a keel yacht so much steadier on the wind than a centre-board that they will have no trouble about letting the yacht take care of herself while they dive below for a while. A couple of tiller lines, spliced to an eyebolt each side of the cockpit floor or staving, is all that is required. A slight strain on the weather one with a turnbuckle over the tiller and will keep the boat on her course, and the shingle-hander can go about his business clearing up down below, securing his anchor, washing down decks or coiling away the gear at leisure. This is one of the many satisfactory features of a keel yacht. The customary lead of gear is to bring the throat down on the port side, the peak on the starboard, jib and topsail halliards on opposite sides, with the sheet or outhaul belayed to a kleet on the boom near the goose-neck. If a binnacle is in the way in the cockpit, a couple of rings in the deck up under the dash, and on this the compass, a glass bullseye in the cabin bulkhead enabling the steersman to conn his ship, aided at night time by a lamp hung inside over the compass, the flame hidden from the eye by the bulkhead. Charts should be well studied beforehand, the islands and dangers prominently marked by blue lines and fields, and cut up into sections to fit a glass covered frame. In this shape they can be kept in the cockpit before the skipper in all weathers, and the tread of the shore, its prominent marks, channels and buoys will impress themselves upon his mind, and he will soon be quite at home. There is no more interesting to the amateur than to pick his way by the aid of chart, compass, lead and glass, and on long runs by the log in addition, something which is still almost entirely neglected by most, but luck and accidental handicaps being ruled upon instead.

CANOEING AT GLENS FALLS.—A correspondent writes that a new canoe club has been formed at Glens Falls, Mass., called the Lake George C. C., and that their fleet will turn out in force for the grand mid-summer meet on Lake George, N. Y. The credit of arousing the canoeing spirit among its members is given to Mr. N. H. Bishop, who has already done so much for the promotion of the sport.

LOOSE ON THE FOOT.—Mainsails loose on the foot will be supplied to some new yachts building in Boston, partly as an experiment and partly because some trials have given great satisfaction. the boats not being "tied up" so much when close hauled.

COOPER'S POINT YACHT CLUB.—This club and the South Camden Y. C. will form a union, with Capt. J. R. Wilkins as Commodore.

NE SCHOONER.—D. D. Kelly, of East Boston, is said to have contracted with New York parties for a 95 ft. schooner.

CEDAR AND CANVAS CANOES.

Editor Forest and Stream:

A canvas canoe consists of a wooden frame (much resembling the skeleton of a wooden boat) with canvas stretched tightly over it. As the canvas skin gives no appreciable support to the frame a boat constructed on a similar frame but with cedar sidings would be the stronger boat in proportion as the wood was stronger, and stiffer than canvas. To make the canvas almost as strong as a cedar canoe it is necessary to strengthen the frame to such an extent that the weight of the two canoes will be almost the same. If willing to sacrifice strength to portability the cedar canoe would fill all the requirements now that Rushton builds his featherweight canoes from 15 to 25 lbs. In comparing the two canoes I will assume that they are of equal weight and consequently of equal portability. A "canoelo" of wicker-work and canvas, 6 ft. x3 ft. x12 in., weighs only 12 lbs., but could not be compared with a canoe on account of its clumsy model. In general the only injuries to which a canoe on a cruise is liable are blows, strains and jottings when shipped by rail or in a wagon, collision with rocks and stranding by waves when in the water. It is claimed by advocates of the canvas canoe that its elasticity enables it to receive, without injury, blows that would break a cedar canoe, the principle being the same as that by which the basket will outlast the box. An elastic canvas canoe would stand the wear and hard usage a ride on the rail or in a wagon entails better than a cedar, but I

think its superiority in this respect is so slight that unless most of the cruise is to be made in a railroad car or wagon, it need not be considered, the more so as it is of far more importance how a canoe will behave in the water. In streams where the current is swift and which are filled with boulders, against which the canoe is often driven by the current, a canvas canoe would be better than a wooden one, but these places are few and far between, and I have found that the majority of scrapes and bumps are from snags and sharp stones, the force being insufficient to injure the cedar boat, but just strong enough to make a rip in a canvas skin.

In my opinion the elasticity of a canvas boat is not only of no advantage in resisting the blows and strains given by waves, but a great disadvantage. It is the water and not the boat that should yield. Taking, then, all things into consideration, I think the cedar canoe superior to the one of canvas. Still the canvas boat is anything but a bad boat, and it can be built by amateurs more easily and cheaper than any other kind, and enables numbers of men who could not afford a cedar boat to appreciate the delights of canoeing, of whom a large percentage eventually graduate into devoted followers of that sport of all sports—yachting. F. M. E.

The Solid South, to a woman, are for Hop Bitters, using them as their only family medicine.

Answers to Correspondents.

☞ No Notice taken of Anonymous Communications.

B., Baltimore.—For working plans see our advertising columns.

M. O., Groton, Vt.—We know nothing of the English gunmaker mentioned.

G., Toronto.—May publish design of yacht such as you speak of in a few weeks.

G. B. A., New York.—When does the trout season open on Long Island? Ans. April 1.

K., Chester.—Designs can be furnished as per advertisement. A fair price for similar yacht of 30 ft. is $900.

F. S. E., Boston.—The use of a single large pill or your gun depends upon whether the gun is choked or cylinder bore.

E. P., City.—No electrical machinery yet applied to launches or boats. Cost of producing the current is against success.

F., Kittery.—Have not published any book. Write to Brentano's, Union Square, for "Nelson's Boat Building," price $1.

W. E., Yonkers, N. Y.—Percussion caps are primed with fulminate at the manufactory. You cannot reprime them yourself.

H. N. P., Amherst, N. H.—The price of Greener's new book will be announced in our advertising columns as soon as it is determined.

SWAN.—1. The usual pull for a 9 lb. 10 gauge gun is 4½ to 5 lbs. 2. We have found the party referred to reliable in his dealings with us.

G., Cleveland.—The boats you mention are well spoken of by those who have tried them. Think you will find the work of any good builder give you satisfaction.

Don, Southbridge, Mass.—There is no American book on dog training. The series of papers published in the FOREST AND STREAM March 18, April 8, April 15, April 29 and May 13, sent on receipt of ten cents each.

H., Constantine.—Paper boats, if built in layers, receive a coat of varnish or marine glue between each. Pay outside with marine glue, rub down smooth and shellac varnish over all. Keep a good coating at all times.

J. B. T., Eaton.—1. The guns are both first-class and either one as good an arm as you want. 2. The $30 guns mentioned we should not advise you to purchase. 3. Select a ten or 12 gauge. 4. In a 10 gauge for glass ball shooting use 3½ drs. powder.

W., Golden.—See this week's issue. Bowditch is the standard and in use in the navy. French sextants are considered the best, but are expensive. Write to Merrill Bros., 179 Water street, for prices. Fifty foot yawl built here for $5,000 or more, according to finish.

R. E., Belair, La.—You should be able to purchase a first-class pointer puppy, from five to six months old, for from $25 to $50. Of course the expense of shipment to your place depends upon the distance from your home to the locality where you make the purchase.

C. E. C., Indianapolis, Ind.—1. You should consult an oculist. 2. The gun is a reliable one. 3. You ought to find something better than fowl to shoot. 4. You will find all the goods you mention advertised in this paper. 5 Dixon's and Elery's goods are for sale by the dealers.

J. R. A., Princeton, N. J.—The cost of a guide in the West varies greatly. Probably you cannot get one for less than $3, and from that up. North Park is a good place for antelope, black-tail deer, elk, bear and sage grouse. Besides that there are mountain sheep, dusky grouse and ptarmigan in the mountains.

R. E. P., Milford.—Will you give me the habits of the carp, their weight, and the kind of water most adapted for them? Also if they are a game fish and will rise to the fly? Ans. We are preparing an article on the carp which will soon appear. We doubt their rising to the fly. They grow to forty pounds.

IRVINGTON, N. Y.—1. You can have the proper load for your gun determined by a gun dealer if you have not opportunity to do it yourself. 2. Your can have your gun converted into a modified choke; cost $3 to $5. 3. The thread-edge cartridges are approved by those who have used them. 4. A larger load than 28 grain powder and 200 grains lead cannot well be used in the old model (1866) Winchester .44 cal. 5. The limit of accurate range is about 500 yards.

MUSKEGO, Milwaukee, Wis.—1. The "bulging" of a choke-bore is not uncommon. It cannot be remedied. Does not hurt the gun and will not affect the safety of the barrel. 2. Other brands of the powder, of a higher grade, are cleaner and more expensive. 3. For light weight, 12 gauge, 30 inch barrels, about 8 lbs. 4. The "scroll fence" is the rim around the nipple which was formerly put there to prevent the flying of the fragments of the cap. It is retained in some guns with plungers simply as a survival.

D., Spencerport.—You have given rather too much depth, unless well cut away. Otherwise dimensions 22x8x3 will do. Keel of 16 in. amidships is enough. Rig is too small. Give 18 ft. hoist to mainsail, 15 ft. to jib, 12 ft. hoist and foot to mizzen. Use single jib, stepmast well forward and sail as a cat boat when desired. Materials $250, iron about 2½ tons for $100 cast to fit. Cost complete here about $700. Weight of hull, etc., 2 tons; displacement, 4½ tons, leaving ½ ton leeway. Put 1,500 or 2,000 pounds iron on keel. No more expensive than smaller piece.

S. W. G., Grafton, Vt.—1. What is the "Cuttyhunk style" of bass fishing? 2. What is the name of the fish common in Western lakes and ponds which is known in Michigan as the "bing gill?" It is in many respects like the sunfish, pumpkin seed or river. Ans. 1. It is throwing a heavy bait from the tip of the rod; it will soon be described in the rules for casting at the tournament. 2. It is probably the *Lepomis auratus* according to Jordan. The older ones were called *Pomatis appendix* by De Kay. If it is the fish called "blue gill" in Western New York, as we think, it has long appendages to the opercular flap which are dark blue, also called "long-eared sunfish." There are a great number of species in the sunfishes and some are hard to determine.

SUBSCRIBER, New York.—1. A makes a match with B that he can kill 10 out of 13 birds, loser to pay for birds; match shot under no other rules or specifications whatever, and A makes a separate bet that he will kill the first and last bird in the match. He kills the first and then misses four in succession, when B refuses to allow him to shoot at any more, claiming that the match was finished when it became impossible for A to win, and that he had won the bet and also that A was obliged to pay for 13 birds. A claims that he has a right to shoot at the 13 birds and if he killed the 13th would win the bet. Who is right? 2. Also to whom did the remaining 3 birds belong, after B had refused to allow A to shoot any more and A had paid for the whole 13 birds? Ans. 1. A could justly claim the right to shoot out his 13 birds. The "separate bet" was undecided. 2. He having paid for them they belong to A.

—Any subscriber or reader of FOREST AND STREAM in want of any kind of carpetings, oil cloths, rugs, etc., etc., can be sure of fair treatment at the hands of John H. Pray, Sons & Co., Boston. Call or correspond with them, and get their prices before buying. It will pay you to try them.—[Adv.

VITALIZED PHOSPHITES.

Composed of the **NERVE-GIVING** principles of the ox brain and wheat germ. It restores to both brain and body the elements that have been carried off by disease, worry, overwork, excesses or nervousness. It promotes digestion and strengthens a failing memory. It **prevents** debility and consumption. It strengthens the brain, gives good sleep, and recuperates after excesses. Physicians have prescribed 300,000 packages.

For sale by druggists or mail, $1. **F. CROSBY, 664 and 666 Sixth Avenue, N. Y.**

Hornbeam Rods
A SPECIALTY.
W. HUNTINGTON,
WILTON, CONN.

Makes a specialty of the manufacture of FINE HAND-MADE RODS of Hornbeam for fly-fishing. Every fly-fisher should have one of these rods, for whatever preference he may have these are the only thoroughly reliable rods, secure against breakage and capable of real hard usage. With one of these rods a sportsman may venture into the woods for a season and take no other rod, and be fairly sure of returning with it in serviceable condition. As made from wood of my own cutting and seasoning, they are powerful, easy in action and full of endurance. For circular send to WALLACE HUNTINGTON, as above.

STONEHENGE ON THE DOG.
Price $3 50.
For sale by Forest and Stream Publishing Co.

$66 a week in your own town. Terms and $5 outfit free. Address H. HALLETT & CO., Portland, Maine.

The Kennel.

FOR SALE—GUS, by Tom (Sensation-Colburn's Belle) out or Blanco, color white, with black ears and points and body spots. Age, 18 months; weight, 55 lbs.; large and stylish; fine speed, endurance and nose; intelligent and staunch before and behind; capable of learning anything and affectionate. Tom and Blanco are both fine field dogs. One thousand birds each over Tom in season of 1879-80. Blanco is of a pure strain of Virginia pointers owned and bred by A. B. Cooke, Esq., of Norfolk, for over 30 years. Gus is sold for a friend, to whom I gave him when he was a pup because he wants the money and for no fault. He is a rare, fine dog, with lots of work in him, and will sell him cheaper to a sportsman than to one who is not. For price, etc., address JNO. S. WISE, Richmond, Va. Mar10,4t

Retrieving Trap Dogs.

The Kennel.

FOR SALE—THE BLUE STAR COCKER SPANIEL BREEDING KENNEL—I will sell reasonable, owing to poor health and increase of private usine's cares, which will call for all the spare time I care to give in the future, and also enabl me to complete my unfinished work on breeding, breaking and management of Spaniels for American Sportsmen. Therefore I offer as above my Kennel stock, all accessories, together with Kennel, name and good-will, to any one having the taste and competent to carry on the good work well. The demand for this breed is immense. Over five hundred pups would have been sold last year (1880) from this Kennel had we had them. My price, $4,000, is extremely low, considering its well-established reputation and lucrative facilities. I will give all time and advice required, gratis, to the successor. One having breeding experience is preferred, and would like to hand over before June next. Only parties meaning business need apply. M. P. MCKOON, Proprietor, The Blue Star Kennel, Franklin, Del. Co., N. Y. Mar10,tf

"THE FISHING LINE."

TAKE THE

Grand Rapids & Indiana R.R.

Mackinaw, Grand Rapids and Cincinnati Short Line

FOR THE

Trout, Grayling, and Black Bass Fisheries,

AND THE

FAMOU SUMMER RESORTS AND LAKES OF

NORTHERN MICHIGAN.

The waters of the

Grand Traverse Region

and the Michigan North Woods are unsurpassed, if equaled, in the abundance and great variety of fish contained.

BROOK TROUT abound in the streams, and the famous AMERICAN GRAYLING is found only in those waters.

The TROUT season begins May 1 and ends Sept. 1.

The GRAYLING Season opens June 1 and ends Nov. 1.

BLACK BASS, PIKE, PICKEREL and MUSCALONGE, also abound in large numbers in the many lakes and lakelets of this territory.

The sportsman can readily send trophies of his skill to his friends or "club" at home, a box for packing fish can be had at many points.

TAKE YOUR FAMILY WITH YOU. The scenery of the North Woods and Lakes is very beautiful; the air is pure, dry and bracing. The climate is peculiarly beneficial to those suffering with

Hay Fever and Asthma Affections.

The hotel accommodations are good, far surpassing the average in countries new enough to afford the finest of fishing.

During the season Round Trip Excursion Tickets will be sold at low rates, and attractive train facilities offered to Tourists and Sportsmen.

Dogs, Guns and Fishing Tackle Carried Free at owner's risk.

It is our aim to make sportsmen feel "at home" via this route. For Tourist's Guide (an attractive illustrated book of 50 pages), containing full information and accurate maps of the Fishing Grounds and Time Cards, address A. A. LEET, Gen. Pass. Agent, Grand Rapids, Mich.

AGENTS IN THE UNITED STATES FOR

Westley Richards Hammerless Guns.

SPECAL ANNOUNCEMENT!

We have just received a superb assortment of these matchless weapons, choked on Westley Richards new system, for **extra close hard shooting, giving marvelous results with light charges,** as the following scores will show:

On May 5, 1880, in the contest for the Allegheny Sportsmen's Association's prizes, and a place on the team to represent this association at the State contest, at 50 wild pigeons, 26 yards rise, from 5 ground traps 5 yards apart, out of 55 competitors, 3 of the 5, Messrs. Register, O'Neil and Bell, made the following score, winning places on the team:

J. Register	11111	11111	11111	11111	11111	01111	11111	11111	11111	11011—48
J. Palmer O'Neil	11111	11111	11111	11111	11110	11111	11111	11110	11011	11111—47
W. S. Bell	11111	11111	11111	11111	11110	11111	11101	11111	11111	11011—47

And in shooting off the tie for second Mr. Bell killed 16 straight at 31 yards rise.

On April 10, 1880, the following score was made at 50 glass balls thrown from Mole's patent rotating trap, 18 yards rise:

J. Register	11111	11111	11111	11111	11111	11110	10101	11111	11111	11111—47
W. S. Bell	01011	11011	11111	11111	11111	11111	11111	11111	11111	11111—47

On May 26, 1880, same trap and rules:

W. S. Bell	10111	11111	11110	11111	11111	11111	11111	11111	11111	11111—48

On June 2, 1880, same trap and rules, the following remarkable score was made at 50 glass balls:

W. S. Bell	11111	11111	11111	11111	11111	11111	11111	11111	11111	11111—50

At Toledo, Ohio, on June 29, 1880, match, 7 wild pigeons at 21 yards rise, Ohio rules, Mr. Bell killed 1111111—7. Tie, 26 yards rise, 3 birds: 111—3. Tie, 31 yards rise: 111 111 111 111 111—15, winning.

One peculiarity of the Westley Richards new system of boring is the small charges required. In the match of May 5, above referred to, Mr. O'Neil used a 12-gauge, 7-lb. Westley Richards Hammerless Gun, loaded with 3 drs. powder and 1⅛ ozs. of shot. Mr. Bell, in all his shooting, used a 10-gauge, 9-lb. Westley Richards Hammerless Gun, loaded with 4¼ drs. powder, 1⅛ ozs. shot. Mr. Register used a 10-gauge, 9¼ lb. Westley Richards Hammerless Gun, loaded with 4¼ drs. powder and 1⅛ ozs. shot.

PRICES OF WESTLEY RICHARDS HAMMERLESS GUNS:

Highest quality, elaborately engraved and finished, best gun made	$450
B quality, not so highly engraved	350
C quality, well engraved and finished	250
C quality, no engraving	190

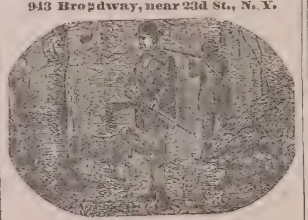
These guns have Anson & Deely's Patent Hammerless Cocking Action and Automatic Safety-Bolt. No possibility of an accidental discharge, as the safety bolt is worked automatically, securely locking the tumblers whenever the lever is moved to open or close the gun.

CAUTION!

ALL GENUINE WESTLEY RICHARDS GUNS ARE MARKED WITH THE FULL NAME,

"WESTLEY RICHARDS."

Guns marked W. Richards, H. Richards, etc., etc., are cheap imitations.



Send Stamp for large 36-page Illustrated Catalogue.

GUNPOWDER!

Dupont's Rifle, Sporting and Blasting Powder.

THE MOST POPULAR POWDER IN USE!

DUPONT'S GUNPOWDER MILLS, established in 1802, have maintained their great reputation for seventy-eight years. Manufacture the following celebrated brands of powder:

Dupont's Diamond Grain.—Nos. 1 (coarse) to 4 (fine) unequalled in strength, quickness and cleanliness; adapted for glass ball and pigeon shooting. Packed in 1lb canisters.

Dupont's Eagle Ducking.—Nos. 1 (coarse) to 3 (fine); burns slowly, strong and very clean; great penetration, with a close pattern; adapted for glass ball, pigeon, duck and other shooting, with either muzzle or breech-loaders. Packed in 1lb and 5lb canisters and 6¼ and 12½lb kegs.

Dupont's Choke Bore.—Specially adapted for "Choke Bore" Guns, and particularly for prairie and upland shooting. Burns slowly, strong and moist; does not cake or burn on the barrels, gives both a good penetration and a close pattern, will be found well adapted for glass ball and pigeon shooting. Made of two sizes, only No. 7 and No. 8 No. 7 being the coarsest. Packed in 6¼lb kegs and 1lb canisters.

Dupont's Eagle Rifle.—A quick, strong and clean powder, of very fine grain for pistol shooting. Packed in 1lb canisters and 6¼ lb kegs.

Dupont's Rifle Fg. "Sea Shooting."—FFg. and FFFg. The Fg. for long-range rifle shooting, the FFg. and FFFg. for general use, burning strong and moist. Packed in 5lb, 1lb and 5th canisters, 6¼, 12½ and 25lb kegs. Fg coarse, FFFg. fine.

Dupont's Sporting, Mining, SHIPPING and Blasting Powders of all sizes and descriptions. **Special Grades for Export.** Also Rifle, Cartridge, Musket, Cannon, Mortar, Mammoth, Hexagonal, Cubical and Pellet Powder, U. S. Government Standard.

Powder manufactured to order of any required grain or proof.

Agencies in all the cities and principal towns throughout the United States. Represented by

F. L. KNEELAND, 70 Wall Street, N. Y.

N. B.—Use none but DUPONT'S Fg. or FFg. for long-range rifle shooting.

The Hazard Powder Co.,

MANUFACTURERS OF

GUNPOWDER.

Hazard's "Electric Powder."

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of one pound *only*.

Hazard's "American Sporting."

Nos. 1 (fine) to 6 (coarse). In 1 lb. canisters and 6¼ lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to shot guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6¼ and 12½ lb. kegs. Burns *slowly* and very clean, shooting remarkably close and with *great penetration*. For field, forest, or water shooting, it ranks any other brand, and it is equally serviceable for muzzle or breech-loaders.

Hazard's "Kentucky Rifle."

FFFG FFG, and "Sea Shooting" FG in Kegs of 6¼, 12½, and 25 lbs. and cans of 5 lbs. FFFG is also packed in 1 and ½ lb. canisters. Burns strong and moist. The FFFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard *Rifle* Powder of the country.

Superior Mining And Blasting Powder.

GOVERNMENT CANNON and MUSKET POWDER; also, SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF, MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's Agents, in every prominent city, or wholesale at our office.

A Skin of Beauty is a Joy Forever.

DR. T FELIX GOURAUD'S

Oriental Cream or Magical Beautifier

PURIFIES as well as Beautifies THE SKIN

Removes Tans, Pimples, Moth-Patches and Blemish on beauty. It has stood the test of thirty years, and is so harmless we taste it to be sure the preparation is properly made. Accept no counterfeit of similar name. The distinguished Dr. L. A. Sayre said to a lady of the *haut ton* (a patient):—

"*As you ladies will use them, I recommend Gouraud's Cream as the least harmful of all the Skin preparations.*" Also Poudre Subtile removes superfluous hair without injury to the skin.

MME. M. B. T. GOURAUD, Sole Prop., 48 Bond St., N. Y.

ANSWERS TO CORRESPONDENTS.... 138

TO CORRESPONDENTS.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen.

Communications upon the subjects to which its pages are devoted are invited from every part of the country.

Anonymous communications will not be regarded. No correspondent's name will be published except with his consent.

The Editors cannot be held responsible for the views of correspondents.

All communications of whatever nature should be addressed to the Forest and Stream Publishing Company, Nos. 39 and 40 Park Row, New York.

FOREST AND STREAM.

Thursday, March 17.

WHERE SOME GAME GOES TO.

NO one whose attention has not been specially called to the subject is likely to appreciate the rapidity with which the game of North America is being destroyed. The practical extermination of the buffalo has already taken place, though, as will be seen below, there are still enough left in the Northern herd to make the destruction of these animals for their hides a profitable pursuit.

We have time and again called attention to the sickening slaughter of the buffalo, which has for years been taking place in the West, and have urged the protection of the largest of our American mammals by national legislation. Ten years ago adequate laws might have preserved the buffalo. Now no legislation can have that effect. Ten years ago buffalo were plenty in Kansas, Colorado, the Indian Territory, parts of Nebraska, and in many other portions of the West. To-day, except for a few scattering animals, they are extinct in the United States everywhere except in Texas and Montana. How long they will continue to exist in Montana each reader can judge for himself by reading the extract from the St. Paul *Pioneer Press* which we print below:

Your special correspondent, on the train to-day from this place to Fargo, met a gentleman just from Miles City, Montana, where he had been for the past four months buying furs. He left Miles City the 14th instant, and came overland on a buckboard to Bismarck, as all trains on the Northern Pacific west of the Missouri River have been abandoned on account of snow. The firm he represents has bought 18,000 buffalo hides during the fall and winter, and he says 83,000 have been purchased by the buyers at Miles City during the past fall and winter, and the number cannot possibly ever be bought again in one season, as they have been slaughtered by the wholesale. The gentleman referred to is one of the largest fur dealers in Michigan, and for the past five years has been pushing to the front in the fur trade, and says the buffalo are becoming extinct at a rapid rate, and gives it as his opinion that of the 80,000 killed near Miles City this season all but 20,000 were slaughtered for their hides alone. Although the law of Montana prohibits the killing of buffalo for their hides only, this wholesale slaughter continues, and to those on the extreme front it is quite a source of revenue, as the hides have brought this season from $2 25 to $2 75 each.

There are still a few of the so-called mountain buffalo in North Park and in the Yellowstone National Park, and it is really on these that our hopes for keeping alive this magnificent race in North America depend. The Yellowstone Park is a Government reservation, and we believe that it is contrary to law to hunt on it. By the appointment of half a dozen game wardens to patrol the park the game now there could be preserved forever.

Not less disheartening than the destruction of our large game is that of the birds. Quail, prairie chickens, ducks and turkeys are shipped each year from this country to Europe in quantities that seem almost beyond belief. A letter from our correspondent, Mr. D. G. Elliott, the ornithologist, calls attention to this subject, and the clipping from a newspaper given below emphasizes what he says. Little comment is needed on the state of things represented to exist. Each sportsman can read and draw his own conclusions. Here it is:

Every year this country augments its exports to the Old World. One of the recent shipments to Europe is wild game from the West, the trade having assumed considerable proportions. The principal points of shipment are naturally Chicago and St. Louis. It is roughly estimated that the business for the present year in the former city will be about $1,250,000 to $1,500,000, and in the latter much in excess of $1,000,000. A single firm in St Louis has already filled an order for the London market for 1,600 dozens of quail, 1,700 dozens of prairie chickens and 700 dozens of wild turkeys. The birds were closely packed in barrels and put in charge of the stewards of the transatlantic steamers. Ordinarily the bulk of shipments is delivered fresh and sound. The present winter is reported to be very favorable to the procurement of game at the West owing to the unusual fall of snow. Venison has been remarkably plenty there. It is also shipped across the sea in small quantities, and dealers are expecting orders for antelope and bear. These are already shipped East, and the demand is growing. A great many English families will have their Christmas and holiday dinners from American game. Various Chicago and St. Louis dealers say that the wild game trade is yet in its infancy, and predict that before a great while it will reach at least $10,000,000 a year.

Now, if one firm does this amount of business, how much is done by all the game trade of the United States, and how long will the country be able to bear this sort of thing, and still have enough left for the sportsmen? Such a state of things would be remedied by a law prohibiting the exportation of wild game from our ports, and this might be backed by laws in each State forbidding the exportation of game beyond their borders. Such laws would probably be very strongly opposed by a certain portion of the community, but is it not necessary that something should be done for the protection of our game? As long as the exportation of game is going on on such a stupendous scale the time and money expended by the friends of protection can avail but little to increase the supply of our birds. We credit the workers in the cause of game protection with a great deal of charity, but we do not believe that they are willing to labor as they have been doing simply to swell the pockets of the dealers in game. What are the sportsmen going to do about it?

DEATH OF MR. L. H. ABBEY.—We record with sorrow the death of Lorenzo Harris Abbey, of the well known firm of Abbey & Imbrie, manufactures and dealers in fishing tackle at 48 Maiden Lane, New York.

Mr. Abbey was for a long time a well-known angler. He was in his fifty-ninth year, and for the past three years his health has been so bad that he has devoted himself almost entirely to angling, and in the hope that the climate of Florida would benefit him he went there on February 26, but without avail. He died at Jacksonville on the 15th of the month, of hydro-thorax. Mr. Abbey was for ten years a clerk of the old firm of Andrew Clerk & Co., and was afterward admitted as a partner in the concern, where he remained for four years until it was succeeded by the present firm, January 1, 1875.

BRITISH vs. AMERICAN TROOP.

GEN. HANCOCK, the new President of the National Rifle Association, has an opportunity for a grand movement in rifle matters if he can and will only improve it. If he can manage to bring together teams of American and British soldiers in such a match as that for the Hilton Trophy he will revive interest in rifle matters and gain credit for himself and the association of which he is the head—a fair test between our Springfield system and the Martini-Henry weapons of the British army. Five years ago, to propose such a match on behalf of the regulars of the United States would have been to place them in a position for sure and positive defeat. The weapon was as good then as now, but the men were not able to use it; and this deficiency Gen. Hancock was the first among army officers of prominence to discover. It was due to his encouragement that the regulars made their appearance at Creedmoor; and the Division of the Atlantic has made some creditable showings at Creedmoor several seasons before the other military divisions of the country were represented by teams. It would, therefore, be entirely fit and proper that the Major-General who taught the whole army how to shoot should appear now as the champion of that force against the similar bodies of other countries. It would be exceedingly difficult to found any reliable estimate of the outcome of such a match. The Hilton Trophy provides for shooting at 200, 500 and 600 yards only. To such low ranges the English shooters would very properly object. The Martini-Henry is a hard-hitting weapon, with charge enough to carry with accuracy up to 1,000 yards. On the Wimbledon Common the second stage of the Queen's Competition is fought with it, and in case of any international team match, the troop armed with that weapon would insist very properly on having it tested to the utmost. The Springfield of the ordinary issue while an excellent mid-range arm would not do good work at the long ranges, nor have the men in the army at the several forts where practice is carried on attempted any records at ranges of from 800 to 1,000 yards. With the improved Springfield, however, it would be entirely possible to make a creditable showing at any range which could be covered by the Martini-Henry.

Of course, there may be trouble in getting two such teams together. Considerable time would be consumed in unraveling the red tape which would surround the proposition; but that the match would be popular and that it would provoke discussion where it is most needed there can be no doubt. Long-range, small-bore shooting is of interest, in a strictly shooting sense, to a comparatively few. What has been done in this way has been of great interest to shooters everywhere; and the lessons of that practice have been taken up by the makers of military arms, so that the matches which we have been having for the past few years have a real bearing on the proposed military match.

The British rifleman and soldier should be, it strikes us, heartily in favor of such a match. Just now the marksman of Great Britain is under somewhat of a cloud. In small bore work he has tried in various ways to gain a victory over the American shooters, and all he has to his credit is the defeat of a company of American gun drummers, even if there be any credit in the routing of the commercial travelers' brigade. There is apparently little disposition on the part of the Britishers to make any further struggle for the long-range championship and the Palma. But Great Britain has an expensive military establishment. For years past rifle instruction has been an important part of the training given her soldiers. To be sure the Boer outbreak seems to be a very recent demonstration that much of the rifle training of the British soldier is of a nominal sort. But the fact remains that, in everything that should make him a superior marksman, he has had superior advantages to his American fellow in arms.

If we cannot have a match among the regulars we can at least have one with the militia of this side matched against the volunteers of England. In arms, experience and familiarity with shooting matters this would make a very even contest. Both forces are built up of civilians, and in neither case would the men be considered other than amateurs in the art of war. There would be less breaking of precedent in such a match, and possibly a great deal less of formality to be circumvented before the men were brought

to face the butts. It would be popular, and could only be productive of good to all concerned, and failing the regular team match, the match of Wimbledon vs. Creedmoor would be an interesting and important one.

THE AMERICA CUP.

As announced in these columns a full fortnight ahead of all its contemporaries, the new sloop building by Cuthbert, of Trenton, Ont., will probably turn up in our waters this summer with her fighting flag at the peak, and a picked racing crew to try her chances for the coveted America Cup. It will be a case of Greek meeting Greek, for Cuthbert's sloop is of the centre board tribe, and in general dimensions and type will not materially differ from our own Gracies, Mischiefs and Arrows. While the match will be none the less international in its political aspect, it will be devoid of the one feature which has made us look forward to the advent of foreign racers in our waters with all absorbing interest. The question of superiority of type, of differences in performance, as well as in appearance, rig and fittings, will not enter into contest, and the match will virtually be reduced to a trial between two individual sloops, both of which may fairly be taken as representatives of American "evolution," though built a thousand miles apart, and on different sides of the line. We learn that an official challenge is to be issued for the new craft in the name of the Bay of Quinte Yacht Club, of Belleville, Ont., one of the most spirited and flourishing of the clubs of the great fresh water lakes. With heavy odds in our favor in the way of greater experience, a course in well-known home waters and weather, and the prestige of previous battles won, the enterprise displayed by our Canadian cousins is certain to meet with hearty commendation. In the schooner matches for the cup a few years ago, the Canadians received fair enough terms, and from what we know of the intentions of the trustees of the cup, equally sportsmanlike conditions will be extended to all comers in the future. The day has fortunately passed when we would insist upon naming a different vessel for every heat according to the weather, after having got the gauge of the stranger, nor is it at all likely that we will again attempt to weight the scales in our favor by sailing a whole fleet of big and little against a single foreigner in the expectation of crowding him out by b'anketing or fouling while some of our vessels have a clear course to themselves and out of the whole fleet some one is sure to find it "just her weather," while the challenger may be all out of sorts in the same wind and sea. The plea that the America won in 1851 from a fleet of British ships is a weak one and will not hold. The lot of old pumpkin-seeds she met belonged, with one or two exceptions, to a by-gone age, were not half the tonnage of Steers' schooner, and were out of the hunt when they hove about for the second or third hitch through the waters of the Solent. Besides, what the America did or did not do has really no bearing on the case. Granted that the deed of trust is open to two interpretations, as claimed by some, it is clearly our business to extend to challenging yachts terms which shall be fair to-day and show no favor to either side. To win from a foreigner as we did from Cambria, pitted against a fleet of racing machines over a tidal course by blanketing and putting the stranger about against the rules of the road, ought to seem barren and inglorious enough to prevent the repetition of such tactics. Fortunately there will be no fresh opportunity for concocting a special rule of measurement to handicap the Canadian should she make her number in the harbor; for in the coming match "what is sauce for the goose is sauce for the gander," and we are unwilling to believe that public sentiment would permit any such doctoring as we have heard whispered might be the case if a narrow, long-legged cutter had made the voyage across the Atlantic in search of glory and "the cup." We do not believe that the New York Y. C. would lend countenance to any such underhand scheme, now that its members at large are far better posted and appreciate their trust with much more understanding than they did some years ago. Let the Canadian come with credentials which cannot be questioned, and she is sure to find us ready and anxious to show fight in a manner becoming to a sport essentially under the control of gentlemen. If Cuthbert's sloop carries away the international silverware, homeward bound, from such a smart and perfect production as Mischief, for example, we will know how to take defeat like men, and we are prepared to cheer the stranger as a craft about as near perfection as will ever be laid down on similar principles. We have not yet seen the new ship's lines or sail draft, but, reasoning by analogy, venture to believe the cup will remain south of the St. Lawrence for some time to come, as long as we are to meet only yachts of our own national type.

It is a Source of Sincere Congratulation to all friends of game protection that the proposed new game law, indorsed by the Long Island Association, has been modified. We reported last week the changes recommended by the members of the Committee of the New York Association, which were substantially as follows:

That the penalties should not be the same for unequal crimes. That the word "willful" should be stricken out of the entire bill excepting in the clause relating to trespassing. That the law on ducks be changed so that the open season commences the first of September. That the law in regard to small fish should not apply to the fisherman who catches them with rod and reel; and that all contraband game should be surrendered to the officer appointed for that purpose in twenty-four hours after it had been received, or the party having the same would be liable to prosecution. The law on summer woodcock shooting is to apply to Long Island only, also the words "voluntary surrender or," have been stricken out of the bill.

These changes, having been laid before the special subcommittee of the Long Island Association, were accepted.

The law is now in such a shape that it commends itself to the favor of sportsmen.

We still believe that bill is not perfect, that the season for selling various kinds of game is too long; but we think also that, as it now stands modified, it is an improvement on the present law.

The Business Community of this City has abundant reason to rejoice over the nomination of Mr. H. G. Pearson as Postmaster. This appointment was demanded by the public sentiment of New York, and President Garfield, in acknowledging the force of this universally expressed desire, has deserved the thanks of all residents of this city. Mr. Pearson has had a long experience in the Post Office, and has enjoyed the benefit of Mr. James' experience and example. He is, of course, familiar with that gentleman's methods, and has ably seconded him in the many reforms which he has inaugurated in the New York Post Office.

Mr. Pearson is known as a faithful and intelligent public servant, and while he is Postmaster New York may expect a service which, for promptness and general efficiency, shall be second to none in the world. It is not too much to hope that our present Postmaster will be as useful and as popular as our last—the best that New York has ever known—who will now in Washington extend to the country at large the advantages that we in this city have enjoyed for years. We are happy to believe that there is no doubt that Mr. Pearson's nomination will be confirmed by the Senate.

A Trip Through the Provinces, whether it costs one or two hundred dollars, is certainly worth taking. The traveler, if he have the powers of observation which all successful sportsmen must possess, cannot fail to see much both in the country and the people that will be new to him as well as interesting.

In the contributions bearing on this subject which we have recently published, many facts have been elicited which will be of use to those of our readers who intend to penetrate the district referred to.

We are always glad to allow the fullest discussion of any subject in our columns, and so have given full swing to Mr. Fay, Mic-Mac and Manhattan; nor would we now check the consideration of the subject could further argument serve any useful purpose. As it is we feel that it must now give place to other matter, and, therefore, after Mr. Fay's reply to Mic-Mac's article in this week's issue, the discussion will cease.

We All of us Desire to be Considered "true sportsmen," but do we consider how dreadfully the term is abused nowadays? Truly, except that unhappy substantive "gentleman," we scarcely know of a word that is more misused and misapplied.

The voice of a true sportsman speaks to-day in our Natural History column, and we commend its utterances to every one of our readers.

We are all far too apt, in the hurry and eagerness of pursuit, to let our excitement get the better of us, to kill too much, to do things of which in our cooler moments we should be ashamed. When, therefore, such an admonition comes to us, when a sportsman, who is at the same time a thoughtful, tender-hearted man—a true gentle man—reminds us of our duty, let us lay the admonition to heart and try to carry the lesson with us when we next shoulder our gun or set up our rod.

"Paddle and Portage" is the attractive title which Mr. Steele has adopted for his new book which is now in preparation. The route over which the party traveled last year was from Moosehead Lake to the Aroostook River, Maine, a country which for book making purposes has all the charms of novelty and beauty of scenery. Mr. Steele obtained a great number of photographic views, which we understand have been hailed with delight by the well-known New York artists, Messrs. Benj. Day and Chas. Graham, who are to illustrate the book. The success of Mr. Steele's "Canoe and Camera" warrants the expectation that its supplementary volume will meet a warm reception.

The Brighton Aquarium.—We regret to learn that Mr. Francis Francis, the well-known Fishery Editor of the *Field*, has resigned his post of Naturalist Director of the Brighton Aquarium. Mr. Francis has brought the Aquarium to a pitch of perfection which was the admiration of scientific men, even so as to win the approval of as conservative a man as Dr. Gunther, of the British Museum, and now, just as he has done this, he has resigned. It is evidently the duty of the Board of Directors to refuse to accept his resignation. Properly managed aquaria are one of the sources of learning, and but few men in the world can manage one. We hope that the next time we visit Brighton we will find Mr. Francis at his old post.

A New Steamer for the Fish Commission.—Congress has appropriated $103,000 to build a new steamer for the Fish Commission to be adapted to purposes of sea dredging and investigation. The Fish Hawk is essentially a river steamer intended for hatching. The new steamer will take the place of the tug Speedwell which has heretofore been detailed from the navy for this purpose, and being built for research will have all the modern appliances and be built with this end in view, and, therefore, more effective.

Good Wine Needs no Bush, and the works of Frank Forester, ever deservedly popular with sportsmen, need no special commendation. A new edition of the sporting scenes and sketches by this graceful writer has just been issued by Messrs. T. B. Peterson & Co., of Philadelphia, having been edited by Will Wildwood, who is well known as an enthusiast on the subject of Herbert and his writings.

This edition contains a life of Herbert, a new introductory chapter and other new matter.

The Sportsman Tourist.

UNCLE 'LISHA'S SPRING GUN.

Uncle 'Lisha Peggs was the owner of a small farm lying so near the Green Mountains that his woodlot was on a westering slope of one of their spurs, and the "black growth" of balsam and spruce crept down to the upper edge of the sugar bush. His acres were too few to keep him steadily employed in their tillage, and so, in slack times, as well as in evenings and rainy days, he mended the boots and shoes of his neighbors, and was sometimes persuaded, as a special favor, to exercise the craft to the extent of building a pair of leathern conveniences. These productions could not be praised for their beauty, for the builder did not hold greatly to snug fits. If the sole of the wearer's foot set fairly on the inner sole of the boot and there were two or three points of contact with the uppers, his ideal of a perfect fit was realized.

He "'callated his stogies 'ould turn water like a cabbage-leaf if you gin 'em a dost o' taller or mushrat'ile onct a week, an' wear julluk iron, an' when a feller onct got 'em broke they sot dreffle easy"—all of which was true, and especially the dreadfulness of the easiness.

One Sunday, late in summer time, when the sun shone hot from a brassy sky through a smoky haze that blurred the shadows' edges and the grass was slippery with drouth, and the locust gave voice to the parching heat, Uncle 'Lisha had performed the duty of church attendance, smoothing his way through it with a comfortable nap, and had eaten his Sunday dinner. He was now taking another nap in his "Windsor chair," atilt on the stoop, his head and face smotheringly protected from the flies by the broad "bendinah hankerdher," used only on Sundays, at weddings, funerals and county fairs. At last an exploring fly found his way under the edge of this expanse of dotted red silk, and got so far on his tour of discovery as the entrance of one of the caverns in the mountain of 'Lisha's nose, into which he was suddenly drawn by a sort of whirlwind, whereupon ensued a commotion which must have seemed to him, at least an earthquake or a tornado. He was cast forth by a tremendous blast, the silken canopy was blown away, the chair came down on its four legs with a bang that awakened Aunt Jerusha on her decorous patchwork couch in the darkened bedroom, the cat from her siesta and set the fowls to cackling.

Of course Uncle 'Lisha was broad awake, and looking in to tell Aunt Jerusha that "the darn'd flies wouldn't let a feller sleep, an' he guessed he'd go up an' see how the corn looked," rammed the bandana into the chamber of his bell-crowned beaver as if loading a cannon, and then putting his head in for a ball, held across lots in his shirtsleeves, his Sunday boots creaking soberly among the fading daisies of the pasture, clattering against them a jerky tattoo. He forded, dry-footed, Stony Brook, now more stony than watery, and went through the corner of the sugar bush, where the giant trees were healing their spring wounds in the summer sunshine, and past the silent shanty hovering sap tubs and the upturned potash kettle, with squirrels and mice for housekeepers.

Beside this lay the two acres of corn, the long leaves rolled by the heat into slender spikes, making the rows indeed "spiky ranks of maize," between which the pumpkins trailed their dark vines overhung by their own drooping leaves, pigeon grass and rag weed, with here and there a yellowing globe shining through the rank growth, but not yet so bright as the golden chalices out of which the bees were drinking honey. The pollen of the tassels powdered the leaves, and the fray of silk at the end of the ears was turning from pale green to brown, showing that the kernels were set and well on in the milk and would soon begin to glaze in the furnace of August. In spite of the dry weather, the promise of a crop was very comforting to Uncle 'Lisha, till as he wandered through the rustling rows he came to the upper edge of the field nearest the dark woods, so near that their balsamic odors spiced the cloying sweetness of the corn.

Here had been havoc. Stalks were torn and trampled down, ears stripped and munched and trodden into the earth as if a herd of swine had been at large among them.

"Coons!" cried Uncle 'Lisha, as at first he stood aghast. "Darn'd if I don't get them Lovel boys to come up here with their hounds to-night! no, to-morrow night."

Then as his eye caught in the mellow soil the imprint of a clawed foot as big as his hand, he started with something like alarm. "Good airth and seas! it's a cussed bear! Yes," he said, as he plucked a tuft of long dark fur from the thorns of a blackberry by the fence, "it's a cussed bear!" Then, as he remembered the day, he apologized to his Sunday clothes—"Wall, he is a cussed bear! Why couldn't he a' eat blackberries, 'stead a spilin' ten bushels o' corn. Dutten corn, too, none o' your nasty Tucket! Gol darn 'im, I'll set a spring gun for him to-night—no, to-morrer night!" And he set his face homeward, full of wrath and news, bearing in his hands a tuft of bear's fur and a munched ear of corn, in proof of the righteousness of the one and the truth of the other.

Monday forenoon was spent by him in warning his neighbors that he was about to set a spring-gun, so that coon hunters and cross-lot travelers might not run into danger in his cornfield, and the afternoon in rigging the deadly contrivance.

First he loaded his ancient piece, which when set upright was taller than himself, with the old military charge, a ball

and three buckshot on top of half his palmful of powder; then bearing the gun and his axe to the edge of the cornfield, he cut two stout stakes three feet long, which he drove into the ground about four feet apart, and then split the tops downward far enough to allow the gripe of the gun to be forced into the cleft of the first and the barrel into that of the second, so that the line of fire should be according to established rule—"at the hayth of the outside bone of a feller's knee." Close to and opposite the lock he drove another stake, on top of which he fixed a short lever with one end resting against the front of the trigger. To the other end, when the work was completed, was attached a line of elm bark, rubbed with earth to dull its too conspicuous whiteness and stretching out sixty or seventy feet beyond the gun muzzle, running at intervals through cleft stakes, wedged to keep them from pinch ng it.

When Uncle 'Lisha's task was done, and he straightened his long-bent back with his palms and gave a last critical look at his infernal machine, he could see no reason why it should not do its deadly work if the bear would do his part. So toward sundown he primed the gun and, setting it at full cock, left it to guard the cornfield. Hoping to get a booming dispatch that should tell the death of the operator of his telegraph, he hardly got into his accustomed heavy sleep till midnight, but was not awakened from it by any sound till cockcrow.

Then, when the rayless sun was rising like a red moon above the ridge of the mountain, he went to the cornfield and found everything undisturbed, no more corn destroyed, and the old gun asleep with beads of dew on its rusty barrel. He made it harmless for the day by brushing the priming out of the pan and setting it at half-cock.

"Las' night warnt his night," he said, "but he'll come tonight, see 'f he don't!" and went home.

Toward nightfall he put the spring gun on guard again. As in the gloaming he leaned over "do' yard" fence, smoking a meditative pipe, with his eastern ear unconsciously cocked toward the cornfield, he became aware of an intermittent glow a furlong down the lonely road that outshone the flashing of the fireflies. It was somebody's pipe, and as it drew nearer its dim light revealed the features of Antoine Bassette, a self-exiled Canadian "patriot," who had fought and fled with Papineau and had taken shelter here, safe from the lion's paw even in the edge of the eagle's nest, where he was hatching out into an American citizen, chipping the shell with brave pecks at the speech and customs of Yankee land. Thus far in his life's pilgrimage he had shuffled along in moccasins, but as he drew near to naturalization he aspired to boots, which, having been bespoken and duly measured for, were the cause of his visit to Uncle 'Lisha.

"Bushoo, musheer," said 'Lisha, airing his French in the twilight.

"Bon soir, monsieur," politely responded Bassette, and then, with more faith in his own English, poor as it was, than in 'Lisha's French, good as its owner thought it:

"Prob'ly you got dem boot done, Oncle 'Lisha, don't it? Wal, prob'ly it ain't. Wal, ah don' care, you gat heem done fore soon, prob'ly. One man tole me bear heat mos' all up you corn, Oncle 'Lisha, an' you goin' catch heem wid gawn. Dat so, Oncle 'Lisha, hein? You tink it bear, Oncle 'Lisha? Wal, ah guess it Beers' hole saow, me. Sacre cochon! heat all ma patack. Daam hole pig like dat! You gat good gawn, Oncle 'Lisha? Ah spose so, prob'ly, good gawn keel bear? Da a no bear you co'nfeel. Beers' hole saow. Ah hope you gawn keich heem, me. You gat dat boots did, Oncle 'Lisha?"

And not till now did 'Lisha find a chance to answer that they were not done and that he was sure it was not neighbor Beers' hog that had done the mischief in the cornfield, for he had seen plainly the tracks of a bear and had found fur such as never grew on swine.

The boots were so near completion that a half hour's work would make them ready for the torture of the poor Canuck.

"Come in, Ann Twine, come in, an' I'll finish 'em up to rights." So saying, Uncle 'Lisha led the way into his little shop and lighted the candle which, stuck in the end of a jointed wooden sconce, illumined his nightly labors. Then he deliberately donned his leather apron, lowered himself into the polished leathern seat of his shoe bench, set his iron-rimmed, owl-eyed spectacles astride his nose, fished out the boots from a clutter of clumsy lasts, broad slabs of sole leather, rolls of cowhide and sheepskin, gave his long shoe knife a rasping on the peculiar coarse, gritty stone used only by shoemakers, and was ready for work, or would have been if the sharp knife had not reminded him of a story which he began to tell, the edge of the knife and the boot, held between his knees, sharing, by turns, his admiring glances.

"Ann Twine, when my father lived in Connecticut he knowed a man that had a shoe-knife julluck that 'at was the cutest thing to cut bread with anybody ever see, so't they use to send for the shoemaker to go to taverns when the' was trainin's and to housen when the' was gret weddin's, an' such crummuxes, jest a puppus to cut the bread. Onct the' was a great shearin' to Colonel Leavenworth's 'at kep a thousand sheep an' had twenty shearers an' big doin's genally, an' they sent for him to"—

But he did not finish his story that night, for just then the heavy air was torn by a loud report, so startling in the midst of the outer stillness that had been broken only by the steady creak of the crickets, that it might remind one of the signal gun of some savagely-beleagured block-house of the olden time, and 'Tater Hill hurled back an echo like an answering gun from another fort and Hog's Back another, and mingling with the swelling and dying reverberations was an angry yell as of attacking Indians.

"Good airth an' seas!" cried Uncle 'Lisha, scattering his exclamations, his spectacles and the boot from the shoe bench to the do'yard gate, as he rushed out, brandishing his knife.

"Come on, Ann Twine, come on, I've got him!"

He was half way across the pasture before Antoine decided to follow him, and the Canadian barely kept the valorous old Yankee in sight in the hazy moonlight as he stumbled across the stony field and splashed through the brook and quite lost him among the shadows of the maples, but found him again in the cornfield just in time to see him charge upon a writhing black object, the bear, sorely hit with the ounce ball and buckshot. The fray was short, the bear sank out of it in a limp heap and his conqueror crept out of it, groaning.

"Oh! Ann Twine, be you here?" he gasped. "The dummed eternal critter's tore all my insides out, but I've gathered up the best on 'em an' I'm goin' to try to git home with 'em."

As he became more clearly revealed to the terrified Frenchman in the hazy light of the harvest moon, he was seen to be stooping painfully along, bearing some burden in his gathered apron.

"Oh, sacre! sacre! sacre! Da's too bad, Uncle 'Lisha, too bad, too bad! Oh, sacre! By gosh, sacre!" He had seen nothing so terrible in the Papineau war. "Oh! what ah do, Uncle 'Lisha, what ah do?"

"You can't help me here none, Ann Twine, but you cut fu' the house an' git onter the hoss an' put fur the doctor. Mabby he c'n stuff 'em back so they'll answer for a spell."

Antoine sped across fields with a face whiter than the moon that shone above him at a pace which had distinguished the close of his military career. He shot himself into the kitchen of the little farmhouse and gave placid Aunt Jerusha a dreadful shock with the dire tidings that "Oncle 'Lisha keel bear an' bear keel heem! Hole man dead an' bringen' hissif home in hees aprum! Ah go for doctor rat off!"

The next minute he was in the barn, saddling the old horse, and five minutes later went clattering down the road at a lumbering gallop toward the doctor's, five miles away.

Poor Aunt Jerusha went hurrying across the pasture to give her wounded lord such succor as she could, with an unwonted sickness at her stout heart. It was a sufficient sign of her trepidation and alarm that she had forgotten to put on her sun-bonnet. Halfway across the field, 'Lisha became discernable against the dull whiteness of the mouse-ear and everlasting of the sterile hillside. As they approached each other, he seemed indeed to be bringing himself home in his apron, as the Frenchman had said, stooping over a burden in that garment which was gathered in both his hands.

"O, father, be you dead?" sobbed Aunt Jerusha, in a voice strangely mixed of shrill and deep tones.

"No, mother, I ain't dead; but I guess I'm goin' to be. The 'tarnal critter has tore me all to pieces! My heart an' lights an' stummeck is inside yet, but I guess he's scooped out all the rest on 'em."

"O, what kin I do for ye, father; what kin I do?" cried the wife. "Antoine's gone lickaty split arter the doctor, an' 't can't be long 'fore he'll come. I do' know as I could git 'em back right if I tried, but I'll try 'f ye say so, father."

"No, mother," 'Lisha answered, weakly; "you can't do nothin', only keep along with me, jist as ye allers have, Jerusha," he added, with a tremulous tenderness in his voice that reminded her of its tones when she was young and fair Jerusha Chase, of Sunday nights, left forty years behind in their plodding journey.

So they went slowly homeward, she, when they came to the fences, making a way for him to pass through. When at last they got home, the good old wife put him and his burden tenderly to bed in clothes and apron, tipped him a stiff dose of cherry rum into oneness, and then with the housewifely instinct strong upon her even in the midst of trouble, put things "to rights" for the doctor's visit, and as quietly as possible awaited that event.

Some neighbors to whom Antoine had scattered out crumbs of the burden of news as he journeyed toward the doctor's, came dropping in to offer their help with the ready kindness of our primitive communities. But there was nothing for them to do. Two or three of the oldest women sat in the little bed-room where Aunt Jerusha watched beside her husband, whom she dared not doubt was soon to leave her alone in this end of the world, for their only son had settled in "the 'Hio," then almost at the other end of the world. The other women sat primly against the walls of the "square room," some telescoping their sun-bonnets together and magnifying in whispers the latest neighborhood gossip.

The men lounged in the doorways or against the side of the house and dooryard fence, and told in low voices their experience with bears and discussed this most recent and tragic one.

"Uncle 'Lisha hedn't fit bears much," said one gaunt farmer who loved hunting more than farming; "'f he hed he wouldn't a tackled one with a shoeknife."

"It don't somehow seem noways fair t' set spring guns and traps and such for varmints, 'thout it's skunks an' mink an' mush-rats. I'd rather shute one bear n' t' trap ten. They ha' no more instinc' about a trap 'n a skunk hes!"

"Wall," drawled an untimely jester, "skunks hes outstink!"

"But then," apologized another, less a sportsman than the first two speakers, "he was a eatin' all Uncle 'Lisha's corn, 'n the'd got to be suthin' did. Gol darned ef I wouldn't kill a bear any way I could if I hed to pizen him."

"That would spile the skin," objected one, with an eye to the main chance, "'n I d' know but 'twould the ile; sartainly 'twould the meat."

"Dot rot bear's meat," cried the despiser of bears, "I'd jes' 's soon eat snake's meat!"

"Wall," remarked the joker, "I've hearn o' folks 'at liked snake's meat. I'd a leetle druther hev bear. It all depends on how a feller was brung up, 'n we never hed no snakes cooked 't our house."

"Wonder 'f Uncle 'Lisha's bear's fat?" queried the thrifty man. "'f he is 't 'ill be quite a help to the widder. Bear's ile is wuth suthin' consid'able."

"Wall, there!" exclaimed the gaunt hunter, unlooping himself from the fence, "why haint we thought to go an' fetch him hum 'stead a-loafin' round here doin' nothin? Come on, men, git a axe to cut a pole an' a rope to tie his legs together, no, the line of the gun 'll do for that."

And so, the axe found, a half dozen of them started across the field and faded out of sight long before their voices were drawn beyond hearing.

The doctor had been aroused from his s'umbers by Antoine's loud summons to "Come up to Oncle 'Lisha. Bear tore his eenside all off, an' he don' gat ma boot done, mos'."

The first of the small hours found the rough but kindly old mediciner at 'Lisha's door before the bearers had returned with the dear-bought spoil.

"Now, come in here with me, you two chaps," he said, selecting a couple of stout hearts, "and bring each on ye a candle. Well, 'Lisha," looking at his patient intently and examining his pulse, "you don't 'pear so very bad off. Guess we can fix you up for another bear fight yet! Now, men, hold the lights," and he put on his spectacles, rolled back his cuffs and turned down the folds of the leather apron. He carefully touched and closely inspected for a moment what was disclosed, then his face flushed angrily and the candle bearers were horrified to see him gather up the trailing mass in both hands and hurl it across the room, roaring:

"You confounded old fool! these all belong to the bear!"

Though 'Lisha had received some ugly scratches, he had suffered no serious injury and was able next day to finish Antoine's boots. And in consideration of his services in the old man's hour of sore trial he was made happy, until he had worn them a day, by having them given him outright.

Keep the kidneys healthy and unobstructed with Hop Bitters and you need not fear sickness.

"A TRIP THROUGH THE PROVINCES."

BOSTON, March 4.

Editor Forest and Stream:

When I hurriedly snatched off the letter which you were kind enough to print in your issue of the 24th ult. I had no idea of entering into a controversy. I simply wanted to correct some statements made as to the chances of getting good shooting in the provinces during a short trip and at a slight expense, which statements I knew from my own personal experience to be such as would give an erroneous idea of the capabilities of that country in that respect.

I endeavored to do so in as gentlemanly a manner as was consistent with having to contradict certain statements made. I was especially induced to do so as I remembered an article on the subject of salmon fishing by the same author which was exactly of the same nature. To the latter, however, I merely referred, as having been (it seemed to me) very thoroughly and properly refuted by "Manhattan." I should be perfectly willing to let the matter rest there, and leave it to the intelligence of your readers to decide whether I had or not shown that misstatements had been made, were it not that in his answer to me, the author of "A Trip Though the Provinces" demands from me an answer to several questions, and takes it upon himself to state that he does not believe that I ever took a salmon, and that personally I know little of certain rivers in New Brunswick. As far as my article goes it would not be of any importance if such were the case, as I merely spoke of his advice with regard to shooting. However, as he has made the statement, I will say that in 1878 a friend and myself were in camp fourteen days on the Nepisiquit River, part of the time on the rough waters, where we paid the government license of $1 a rod per diem, and part of the time at the Pabineau Falls and at Lanegan's camp at the Chain of Rocks, where we were enabled to go by the invitation of one of the gentlemen who leased the river from the Canadian Government, to whom we had letters of introduction, and who was kind enough to extend this hospitality to us. During this time we fished every pool in the river from the Chain of Rocks down, that is every pool except those at the camp at the Great Falls. These we did not fish as there was another party there, but we did go up in our canoes to see the Great Falls. During this trip we (two rods) killed thirty-two fish, salmon and grilse.

The following year we went into camp again on the rough waters, and in two days killed one grilse apiece. As the prospect was not very encouraging we broke camp, put ourselves in light marching order, went up to the Great Falls, portaged over them, poled up the Nepisiquit as far as Portage Brook, between seventy and eighty miles from our starting point, Bathurst; portaged over into Upsalquita Lake and down the Upsalquita River into the Restigouche, and down the Restigouche to Cambelltown, from where we took the railroad back to Bathurst, the round trip in canoes being not less than 200 miles. As we had no permit to fish for salmon, we did not take our salmon tackle with us on this trip, nor did we endeavor to do what could very easily have been done at the Great Falls of the Nepisiquit, try to get hold of salmon on our trout rods. Both there and paddling down the Upsalquita and Restigouche rivers we could undoubtedly have taken a few salmon, and certainly no questions would have been asked, but that is not our idea of the way of doing things. Last season we were fortunate enough to be able to under-lease one of the rivers that empty into Gaspe Basin, and we spent ten days in camp there. We killed eight salmon that averaged nearly nineteen pounds (18¾).

By-the-bye, during our first trip, *i. e.*, in 1878, after we broke camp on the Nepisiquit, my friend wanted to profit of the last days before the season closed, and as I had enough fishing for that season I went down to Pokemouche for a few days plover shooting, and he taking one of our men with him went up the little southwest branch of the Mirimachi, having to hire two canoes and three Indians to make up his crew. He killed six or seven fish and joined me on the 2d of September.

I am aware that all this is not a matter of interest to anybody; but it does show that I have taken a salmon and that I do know something of the Nepisiquit, Upsalquita Restigouche, and, through my companion, of the Mirimachi, in spite of Mr. Fay's belief to the contrary. These scores are not very large ones, but still they show that he did have a certain amount of salmon fishing. But how did we get it? The first year through the fact of having friends who were kind enough to give us letters to gentlemen who invited us to fish on their river; the second year we got no fishing to speak of; the third we were lucky enough to be able to sublease a river from a friend. In addition to this personal experience we had with us as canoemen and guides men who know and have been about every salmon river in the Dominion—certainly all that empty into the Bay of Chaleur—and all the important ones on the St. Lawrence, going down to the north shore—almost to the Straits of Belle Isle. These men are very anxious to have us get fishing and have given us all the information on the subject that experts could give, and are on the watch for any possible chance; and yet we have about come to the conclusion that the only way to get salmon fishing is to hire a river which, unfortunately, is beyond the limits of our purses. I have never said or implied or thought that there was no salmon fishing in the Provinces; but I do say and know that it is not to be got by anybody who happens to get two or three weeks spare time and has a hundred dollars in his pocket; and anybody who starts off with any such idea will come back sold. The only open fishing in New Brunswick at present is on parts of the Mirimochi and on the rough waters of the Nepisiquit; to fish the latter of which one dollar a day per rod must be paid. Anybody who fishes elsewhere in that Province for salmon without either hiring or being invited by somebody who does hire, simply poaches. I have no doubt that often pity has been taken on parties who have dropped down there without any definite plans or ideas on the subject, and that the right to fish for a day or two has been granted them; but I do not suppose that any gentlemen would want to start off deliberately with the idea of sponging on somebody. I am accused of lacking careful observation and being more stupid than a schoolboy because I said that from Mr. Fay's account of the expenses one was rather in doubt as to whether he meant one hundred dollars apiece or for the three. I showed, however, that the latter was impossible; but my reason for expressing the possibility of a doubt was that in his list of expenses among the items, "Fares from Boston to Bangor, Bangor to so-and-so, etc., which from the amount must be individual fares, he enters $12.00 for team from Windsor to Chester, which is the amount he states *they* paid for their conveyance. Now, they either paid $36.00 for that team or the amount entered ought to have been $4.00 instead of $12.00,

That is what I call an "inaccuracy." He asks me so many questions that I cannot impose upon your good nature by taking up space enough to answer all of them; but some I will reply to as briefly as possible. My object in going to New Brunswick was the hope of being able to combine fishing and shooting. I returned there because I liked the country and the men that we hired as guides and had sport that satisfied me, although it has been by no means phenomenal. With regard to the expense, I do not care to say anything more than that it has been by no means a cheap trip, judged by Mr. Fay's standard. I have not and do not propose to publish an account of our trips, because, although they have resulted in a great deal of recreation and recuperation, they have been very uneventful and would not interest anybody; and I do not, on the strength of a few weeks' annually spent in the woods, feel competent to give advice to anybody on any subject,—always excepting the right of warning the public against evident misstatements and exaggerations.

Having said this much it will be no more than right for me, however, to make the following statements as to what my knowledge of the country has taught me with regard to its advantages as a resort for parties seeking sport. A party going at the right season, to the proper places, and having proper guides, will be pretty sure to get very good trout fishing, much more so than in the Adirondacks or in the State of Maine. Guides and canoes are cheaper, and the cost of board at the taverns and inns is less, although the accommodations, outside of the large towns, are very poor. At the proper season very fine snipe shooting can be had, also plover, curlew, dough birds, yellow legs, etc. Ducks and geese are abundant, but not easy to get at. Partridges near the settlements are not very plenty; six is the largest bag I ever made. As to taking down dogs I must persist in laying more stress on my own experience, than on the fact that somebody told Mr. Fay that he better bring a "bird" dog with him. I ruined a very promising young setter, who was nicely broken and only needed experience, by taking her up to the Umbagog region some years ago, where the habits of the ruffed grouse are, or were, exactly the same as in the Provinces.

Two years ago I took up to New Brunswick a Gordon setter that I thought a great deal of, and found him absolutely useless for partridges. He was very useful simply as a retriever, but few setters or pointers could stand the exposure of being used to retrieve ducks and geese during the later part of September, to say nothing of the chance of spoiling the delicacy of their mouths in tackling so powerful a bird as a broken-winged black duck or wild gander. Therefore I repeat what I said before, that the best dog to take is a good retriever, *i.e.*, water spaniel, Chesapeake Bay dog, or the regular English curley coated retriever, if such a one can be got. If Mr. Fay has not shot enough over dogs to be able to understand that because a setter or pointer is of use in western quail and grouse shooting by finding the game, pointing it and standing staunchly on point until the sportsman comes up, and that it does not follow necessarily that the same dog will be of use in partridge shooting, where the birds are so tame that they will simply walk away from the dog, and will not get up unless the dog rushes in on them, we simply cannot argue on the subject.

The chances of getting a caribou or moose would, I think, be infinitesimal except after the snow fall in the autumn. Bears are very numerous, but I never knew of a sportsman shooting one. Lastly, the fact that a license of $20.00 in New Brunswick and $50.00 in Nova Scotia, is exacted from non-residents should not be forgotten.

With regard to the information asked about Gaspe Point, as I suppose he refers to the salmon rivers that empty into the Gaspe basin, *i. e.*, the Dartmouth Fork and St. Johns, I can tell him that if he wets a line in either of them he will have to do one of three things, either get an invitation to fish there from one of the lessees, or hire the right to fish there from the lessee, or poach; and in case he does the latter, I can guarantee him that in spite of his previous experiences, questions will be asked.

As I do not, however, imagine that he purposes to fish without the proper credentials, I suppose that he is lucky enough to have one of the other resources to fall back upon, and I congratulate him most sincerely on his good fortune, and wish him all possible success. As far as his advice not to go for a person goes I should be willing to leave it to any unbiased reader as to which of us two has been gone for most savagely. I accept, however, my castigation in good part and should be most happy to shake hands, only if I ever should have that pleasure, I should re-iterate the only point that I have been trying to prove, and that is, that neither good salmon fishing nor good shooting are to be got in a few days and at a small expense in New Brunswick, nor for that matter in any other place, that is known to MIC MAC.

OCTOBER REVERIES.

Ye peaceful hills!
Ye clinging pastures 'neath the rocky slopes,
Where dreaming kine, 'mid haunt of fox and grouse,
Feel reft of man's unwonted hand and room
The rugged face of Nature, envying not
Their fellows in the greener glades below!
Ye fragrant, weird, unfathomable woods!
Within thy mystic labyrinths I trod
A youthful huntsman, eager for the chase;
There, by some fallen giant of thy race,
Whose grizzled garment, rent with storm and death,
Revealed the piteous wounds by tempest given,
I paused with such tense strain of ear and eye
That every sound came fraught with mystery.
The pattering nut, the gently swinging leaf,
Which, winnowing slowly in its downward flight,
Kissed loving partings to its browny mates;
The springing branch, the distant groaning tree,
Which, moved by winds undreamed of at its base,
Too roughly bore the knotted arms together—
All seemed to people the aisles with sound
That when from out the dreamy fictions wrought,
Some hapless partridge stalked the sunlit glade,
I scarce awoke until the fateful gun,
By instinct aimed, startled with keen report
The Nimrod of my soul to life again!
Thenceforth Apollo ruled,
And throbbing pulses beat in unison
To far-off music of the baying hounds.
The stern intent, the half-barbaric mood,
So lately wedded to its sylvan spouse,
In cosmic meditation, swept the bright
And beauteous cobwebs to forgetfulness.
And yet not all forgot! Still oft my thoughts
In pleasant reveries do conjure back
The days by fell and stream. Gray branches lace
Their network 'round the dark secluded pool
Where wood-ducks hide; far overhead the hawk
In easy circles floats on silent wing,
And ringing notes of quail, from stubbles brown,
Fill up the magic measure of the hour.
Flung over all I catch thy russet glow,
Thy mellow golden tint, O, Nature fair,
And view thee at thy loveliest, richly clad
In the bright garb of thy October days!

WENTWORTH WADSWORTH.

Natural History.

SNAKES—FACTS AND FABLE.

SIR JOSEPH BANKS was the first to explain the snake's mode of progression. Placing his hand under a moving coluber he felt the ribs come forward like the feet of the caterpillar The ribs are so many pairs of levers, by means of which the serpent moves. The vertebræ forming the spinal column are joined together by ball and socket articulation, thus securing the greatest possible freedom of motion.

To each of these vertebra are attached a pair of ribs; the small ends of these ribs are not united to a sternum, but to a single scale on the abdomen by means of a slender cartilage and a set of muscles. The ribs are the snake's legs and act in progressive order like the legs of the centipede, each pair bringing forward the scale to which it is attached. Therefore, the snake is helpless if placed on glass or polished metal.

The snake is without an eyelid, but his optics are perfectly protected by a hard, transparent membrane over each. In spring when just ready to shed his skin he is almost blind, as then he has two scales over his eye. If we examine the head we will see that the bones of which it is composed instead of being firmly locked together as in mammalia are separate, and retained in their places only by the skin and ligaments. The lower jaw is formed of two bones united in front by a lax membrane.

It is this peculiar formation of cranium and jaw that gives to the mouth of the serpent such marvelous power of expansion. All snakes when shedding their skins crawl out of the front part first quitting the tail last.

Venomous serpents have two effective fangs which are replaced, so that if the perfect ones are removed or broken others are soon ready to supply their place. In all arboreal snakes the tail is very long and highly prehensile. All species of venomous snakes common to the U. S. have short tails and are none of them climbers.

Audubon pictures the rattlesnake chasing a squirrel up a tree, and Waterton says that he climbs trees by muscular contraction; which *no* snake can do. All arboreal snakes ascend the trunks of trees in a straight line, and not by winding around them. The rattlesnake cannot climb a tree at all, yet he gets all the squirrels he requires by the power of his evil eye.

A friend of mine some years ago captured a very large rattler and put him in a box; when he went to look at him next morning he found him dead, with a gray squirrel fast against his fangs. Wilson describes in glowing language a wonderful battle that he witnessed between a mocking-bird and black snake, in which the bird was an easy victor, leaving her enemy mangled and dead at the roots of the magnolia tree in which were her "babes in the nest." Now you can whip a rattlesnake into ribbons with a twig, but the black snake (*Bascadion constrictor*) dies hard. Frank Buckland says that the proper way to kill a snake is to leave his head alone and strike him on the tail. I found last summer in a meadow, some weeks after the harvest, a large black snake that had lost almost half its length by the scythe of the mowing machine. He was alive and active. His tail had been struck, but death was not instantaneous, as Mr. Buckland promised it would be. A mocking bird would be utterly incapable of injuring a black snake in any way I have heard from many a rustic marvelous stories of the deadly hoop snake. He has, they say, near the extremity of his tail, and at right angles with it, a long, sharp spur like that of a cock, but hollow and filled with deadly venom Taking his tail in his mouth, like the great Midgard serpent, he rolls with wonderful rapidity down the slopes of hills, and if any animal is in his path he strikes it with his poisoned weapon and death is instantaneous. If by chance he strikes a tree the leaves wither and it is dead within an hour! I have conversed with different people who claimed to have seen and killed many of these snakes, and yet such animated hoops have never rolled over any part of the good green earth. While hunting in the Alleghanies last autumn, a gentleman told me the following snake story: "Yes," he replied in answer to a query from me, "there are plenty of rattlers here. I once found a den of them on the river bank among the rocks at the foot of the cliff yonder. I could not get to them, you see; so I waited until the first September frost, and then threw over to them a quantity of straw. I knew that as the nights grew chilly they would creep into this to keep warm. So after a while I went out to the cliff and threw over into the straw a blazing pine torch, and soon the whole was wrapped in flames. Such rattling and hissing I never heard before. Hundreds of them were in there, and most all were burned up, and the oil ran down the rocks and floated off upon the water. Some emerged half roasted from the flames, with head and tail erect, wild with pain, and fought each other till they died."

All snakes are excellent swimmers, and can cross wide and rapid streams. Many serpents will hybernate together, frequently of different species, rolled up in balls and hid away in caves and cliffs. Mr. Buckland says that there is a singular snake in South Africa whose principal food is the eggs of birds. His teeth are in his stomach, otherwise, he states, the contents of the eggs would be wasted, as the shells would be broken against his teeth were they placed in his mouth as in other snakes. I once saw a wood-cutter sever a large black snake with his axe, and out there tumbled a half dozen or more of the eggs of the ruffed grouse, not one of which was broken. They appeared to be fresh, and had evidently just been swallowed. It is believed by many that this black rascal kills the rattlesnake, crushing him in his voluminous folds, bites his head off, and swallows him! No snake can bite off another's head. They can neither masticate nor separate their food; they must bolt it entire or not at all. Sportsmen should remember that our game birds have no deadlier foe than the black snake, and should show him as little mercy as he has for the young of the quail or the ruffed grouse.

The Roman historians relate that the army of Regulus, while invading Africa, was assaulted by a monstrous serpent which they finally succeeded in killing with their military engines. The skin, measuring 120 feet in length, was sent to Rome and preserved as a trophy in a temple until the Numantine war.

Diodorus Siculus mentions a serpent which was captured, not without loss of human life, in Egypt, and exhibited in Alexandria. He gives the length as 45 feet. Suetonius speaks of one exhibited in front of the Comitium at Rome measuring 75 feet in length. No serpent has ever been seen in modern times that would measure 40 feet. The skin of a snake may be stretched about one-fourth longer than was the living animal.

The loss of human life by the fangs of venomous serpents is frightful. There were killed in British India alone, by snakes during the three years ending 1869, no less than 25,664 persons! The most deadly of all serpents are the cobra-di-capello, of the Orient, and the bush-master, of South America. The fangs of the latter are said to be quite *three inches* long, and the wounds inflicted by them terrible. Fortunately for us serpents have many enemies, chief of which is man. Swine feed upon them, and they are cut to pieces by the feet of deer. Birds, also, destroy immense numbers; the hawk, eagle, and notably the adjutant are famous snake killers. Then they are cannibals, too, and destroy each other. The keeper of the reptile house at the London Zoo saw his two pythons safe at night, and in the morning there was but one. There was only a foot's difference in their length, and yet the larger had swallowed his mate.

The serpent figures in the folk-lore of every nation. The old sea rovers of the North believed that there was a beautiful blue snake that wore on its head a crown of the finest gold, bedecked with the fairest gems. He was king of the snakes, and the followers of Odin searched for him far and near in many lands, for whoever wore his glittering crown could not be hurt by stroke of sword or thrust of spear.

Bridgeport, W. Va. XIL YORRIS.

The snake with teeth in its stomach to which our correspondent refers is a very interesting reptile, and deserves, perhaps, a description a little fuller than he gives it In this genus, *Deirodon*, the teeth are extremely minute, and are very early lost, and the animal goes through life without any teeth in the true acceptation of the term. It is, however, provided with an apparatus which fulfils one office of teeth, although not situated in the jaws. The hypapophyses or ventral spines of the posterior, seven or eight cervical vertebræ, enter the œsophagus or gullet through the upper walls of that organ, and being sharp pointed and tipped with cement, they must necessarily cut anything that passes by and rubs against them. The serpent swallows the egg without breaking it, and in its passage down the throat it is sawed in two lengthwise by these spines and the contents thus liberated.

It is probable, however, that the gastric juices of most serpents are sufficiently powerful to dissolve the shell of an ordinary egg unaided by any mechanical means.

WHISTLING TO THE SQUIRRELS AND BIRDS.

ONE afternoon last summer when out looking for game I sat down on a pile of rails to rest. Pretty soon I discovered in an oak tree, some twenty yards away, a red squirrel stretched at full length on a limb taking a sun bath.

Instead of raising my rifle and sending a ball through the little fellow (it's a mighty mean "sportsman" that endeavors to kill all he sees) I decided to give him a little pleasure if I could, so I commenced to whistle the air of that once popular ditty, "I love thee, sweet Norah O'Neil."

In a twinkling the squirrel was up on his hind legs, his tail over his back, his head cocked to one side, listening to me; a moment of irresolution and then he scampered down the trunk of the tree to the ground and started toward me; he came a few yards, stopped, set up on end and listened again. I was careful not to move, and kept on whistling; after waiting a moment the little beauty came on, jumped up on the pile of rails, ran along within four feet of me, halted, went up on end again, made an umbrella of his tail, tipped his head to one side, looked at me with all the gravity of a justice of the peace at his first trial, and yet if ever a creature's eyes beamed with pleasure his did.

I did not move, but after a little I abruptly changed the tune to the "Sweet Bye and Bye." Chut! Why, with the first note of the different tune away went the squirrel. I did not move, only as I shook with suppressed laughter, and as well as I could I kept on whistling. In a minute or two back came the squirrel, going through all the cunning manœuvres of his first approach, and once more took a seat beside me on the rails. I watched him, and actually thought he was trying to pucker up his mouth and whistle.

Once again I changed the tune, this time to "Yankee Doodle," and as before, with the first note of change, away scampered the squirrel. Unable to control my risibilities longer, I laughed aloud, and after that I couldn't call my little friend to me.

I wonder how many of the so-called "true sportsmen" ever seek or think of any pleasure in connection with such beautiful little creatures save the savage and unmanly pleasure of taking away their lives!

I wonder how many ever go to the dear old woods for the purpose of making a friendly call upon the song birds! What joyous hours I have spent with them! What pleasant memories come to me as I write. I remember especially one afternoon last summer which I passed in the woods. I found a leafy thicket and slowly and cautiously crawled into it; after a little I commenced to hum a low, soothing tune, then I whistled a little—and I am an exceedingly poor singer and whistler. Soon there were robins, sparrows, thrushes and other birds sitting in or flitting about in the branches over my head. When I had finished a tune what a glorious concert they would give me. Some of them would come close to me, and I could see the thrill and quiver of their little throats as the melody within them seemed to struggle for utterance. O, but I enjoyed myself quite as well as I should using my gun upon legitimate game, and no man loves to use a gun better than I, and few use it more.

Had a sportsman (?) come along and shot one of these birds, either he or I would have had occasion to purchase a piece of beefsteak to put over a black eye.

At the end of an hour I left that thicket feeling wonderfully recuperated in body, and loving the dear Father above and all the works of Nature better than when I entered it.

I tell you, brothers, if when out on our vacations we thought a little less about making a large bag of game and sought a little more earnestly to come close to the great pure heart of Nature we should be gainers by it.

"In conclusion"—as I often say on a different occasion—I have read several articles of late which sought to tell what traits were necessary to constitute a "true sportsman." I simply wish to say what in my opinion a true sportsman will never do. He will never inflict unnecessary pain; he will never shoot game unless he is reasonably sure that it will not be wasted; he will never kill a song bird, or wantonly destroy a harmless insect; and he will kill every fish the moment he takes it from the water. J. FRANKE LOCKE.

Burnhamville, Minn., Feb. 28.

A WINTER RESIDENT IN PENNSYLVANIA—Williamsport, Pa., March 1.—There are numerous notes from correspondents in FOREST AND STREAM referring to various kinds of birds being seen at unseasonable times, but I have observed one migratory bird which has surprised me more than any of them—namely, a song sparrow (*M. melodia*)—which has kept around our place all winter. Only this morning, after a snow storm lasting twenty-four hours and with twenty inches of snow on the ground, the little fellow (it is a male) perched on a vine before my door and chirped his little song; but, alas! in melancholy contrast with his cheery notes in the spring time. My nephew has been feeding the birds all winter and little *M. melodia* has come regularly for his rations with the European sparrows and snowbirds. The bird has a rather dilapidated appearance, but I presume a new spring suit and a couple of weeks of warm sunshine will remedy that.—LYCOMING.

SPRING IN MINNESOTA—Burnhamville, Minn., March 1—"Spring, beautiful Spring" has come, but it isn't the time of the singing of birds, neither is the voice of the turtle heard in the land. The snow is fully three and a half feet deep on a level, and this morning the thermometer indicated 27 degrees below zero. It is reported that a coon was seen a few miles from here this morning walking about on snowshoes, and it is feared that all hibernating animals of this latitude will adopt the same means of locomotion and go South.—J. F. L.

BREEDING OF THE HORNED OWL.—A couple of friends of mine collected a set of four great horned owl's eggs near Boston Mass., yesterday (March 10).—E. M.

ANIMALS RECEIVED AT CENTRAL PARK MENAGERIE FOR WEEK ENDING MARCH 12.—One brown capuchin, *Cebus fatuellus*, presented by Mr. A. E. Smith; one horned owl, *Bubo virginianus*, presented by Dr. E. Edson, Whiteplains, N. Y.; one pure white opossum, *Dedelphys virginia*, presented by Mr. E. E. Stewart; one mona monkey, *Cercopithecus mona*; one spider monkey, *Ateles geoffrogi*; one Salle's amazon, *Chrysotis salleï*, purchased; two giraffes, *Camelopardalis giroffa*, placed on exhibition.

W. A. CONKLIN, Director.

Game Bag and Gun.

IN EAST TENNESSEE.

EARLY in the month, one bright October morning, and before the unpleasantness that once existed between the North and South, the writer of this with three friends, all mounted on mettlesome steeds, might have been seen at a brisk trot on what was called the Bottom Road that ran along the right bank of the upper Tennessee River. Our objective point was B——. The road was very crooked, had probably been "blazed" by a pioneer full of new corn whiskey, or, more probably, an original cow path. At times it led us near enough to the stream to afford the eye a momentary feast upon the glinting, silvery water through a many-colored curtain of autumn leaves, then, turning abruptly again, would plunge us into a lofty growth of oaks and hickory with beech gums and alder, the dense foliage of which tempered the bright sunshine of the morning almost to the gray of an evening twilight.

Meeting an ancient specimen of the colored race and inquiring the distance to B—— he imparted the definite opinion that he having "lef' dar afo' sunup, it must be free or fo' mile." It was now nearly nine o'clock and we had been in our saddles since five o'clock. On we went, however, and in half an hour or so, coming suddenly upon a low, tumble-down fence that marked the extreme boundary of a field of tall corn, and the sight of a group of stick-and-lath chimneys and low, shingle roofs in the distance, announced to us that B—— lay just ahead.

As we galloped through the village little towheaded urchins peeped at us from behind house corners and coy maidens in calico dresses, sallow faces and flax-colored hair timidly appeared at windows to catch a glimpse of the disturbers of their usual quiet life. B—— had been "finished" many years before our advent into it. It consisted of twenty-five or thirty hewn log houses, innocent of paint or whitewash—each flanked by tall weeds and an occasional sunflower—strung carelessly along the road, the lofty Cumberland Mountains in the rear and in front the crystal waters of the Upper Tennessee and hoary headed hills.

Fronting the river and standing sideways upon a road that led back toward the mountains stood the grocery—the most pretentious building in B——, and reining up in front of it at the cheerful command of the proprietor (a tall, thin personage, in all the glory of a brand-new broad-brimmed hat and shirtsleeves, leaning carelessly against the door-jam), "Git deown, gentlemen," we dismounted to rest the seats of our trousers and await the arrival of the team that was following us.

The "grocery" combined within its dingy portals a careless selection of cheap dry goods, groceries of the coarser sort, numerous jars filled with highly colored stick candy, the post office, and, arranged in a row like a file of soldiers at a "dress parade," stood eight barrels with wooden faucets near the lower heads, emitting an odor not exactly from "Arahy, the Blest," but more suggestive of a still-house. Obeying the mandate that in rude letters on a broad board securely nailed over the door, admonishing the wayfaring to

STOP. AND. TREET,

we sampled the contents of a barrel, which, the landlord assured us, was the best peach brandy made in that county. Mixed with wild honey it formed a very deceptive and headachey compound.

Sitting astride of a molasses barrel, resting his shoulders against the counter and cracking the joints of his fingers, his old slouch hat slightly pulled down so that the brim shaded his left eye, sat a rotund individual dressed in linsey-woolsey pants, tow-cloth vest and check shirt. His feet were shoeless and bare. Great bags under his eyes and a general puffed and translucent appearance would indicate him to be a thorough lover of "peach and honey" or some other villainous compound of alcoholic tendencies. This man the landlord introduced to us thus:

"Gentlemen, this is my naber and friend, Captain Blum. He is crippled bad; he fit in the war and got winged in the leg by one of Saintanny's bullits."

"Captain Blum, we are glad to see you, and we honor all old soldiers."

"Captain, will you join us?" inquired the Colonel, with a slight inclination of his head in the direction of the rank of eight barrels, and the gallant Captain joined!

"Ven ve vos fitin' dem vellers in Mexigo, eef Sheneral Schott bin geef beech and honigk like dees war, den ve vere cabdure dat ceety sooner as any Yangee speeks Shack Roberson." This compliment to the landlord's peach and honey the Captain leisurely paid while he placed himself outside of a bumper of the compound large enough to make the head of the Hudson River ache for a month!

As the last drop disappeared down his capacious throat his bleary eyes rolled in their sockets, and his great fat lower lip also rolled from the left to the right corner of his mouth something as soil leaves the mold-board of a plow! A good careful look at Captain Blum was a temperance lecture excelling any of Gough's in practical impressiveness.

East Tennessee was, at the time of which we write—and probably now is—a paradise for the hunter. The valleys lying between the numerous spurs of the Cumberland Mountains were sparsely inhabited and very fertile, and mast producing trees grew most luxuriantly, affording a never failing supply in a season for mast eating game of all kinds; while frequent saline springs and grassy glades furnished attractive haunts for deer.

It was to one of these valleys that we were bound when we left Colonel Brettle's hospitable home in North Alabama for a week or ten days' hunt after game as was game.

Our party consisted of Colonel Brettle, our host, a genial Southern gentleman and true sportsman. Mr. Adams, then a member of the Bar, but now before the Highest Court. (May he rest in peace.) Mr. Samuel Evans, an Englishman, a crack shot, good singer, and chock full of hearty John Bull growl; but

"He was a jolly good fellow
As nobody will deny."

Rube, the Colonel's "boy," capital cook and good fiddler, and full of fun as any darkey in the State of Alabama. Tom, another of the Colonel's "boys," general teamster and man of all work; and the humble writer of this truthful story.

A pleasant chat of an hour with the doughty Captain Blum and the proprietor of the grocery was interrupted by the distant rumble of an approaching wagon, the white cover of which was seen undulating above the tall woods that garnished the roadside, and we were soon joined by Rube and Tom. Giving the mules a rest we prepared for the tedious portion of our journey, to wit, crossing the mountains.

Bidding our new acquaintances good bye we mounted, and taking the cross-road leading back toward the hill, the sleepy little village of B—— was soon lost to view.

Gradually ascending a broken, rough, seldom traveled stony road, apparently winding around the base of the mountain, we entered the gorge. The way was dangerous besides being tedious. On either hand the mountains arose for probably a mile in height, covered sparsely with scrub oaks and dwarf pines, with numerous immense rocks jutting out their bold bare heads, as if threatening to tumble down upon any intruder upon their desolation.

The five weary miles through the gorge were covered, unchecred by the sight of any living thing except the skipping of an occasional squirrel as he, frightened, fled from our presence through the tree tops.

At length a point was reached where the mountains appeared to recede and suddenly widen, opening to our view a cup-shaped valley many feet below us, penned in, as it were, by lofty hills This valley was probably four miles in diameter, and a careful examination revealing no smoke ascending above the tree tops, we confidently expected, therefore, to go upon ground rarely visited by Nimrods.

The pleasant prospect before us infused new life into our already jaded animals, and the declining road soon brought us to the base of the mountain, along which prattled a lively little stream of water, cold as ice and clear as crystal; man and horse were soon refreshed. Now leaving the almost trackless road, and crossing the stream we turned to the left through a glade covered with soft hickories and oaks. Here we halted on a gentle knoll shaded by an immense white oak tree convenient to the stream.

Tired as we all were we were ready to shout Eureka! with hearty good will.

Our wagon had been packed with considerable care and contained besides many minor matters which "come in" just right when they are wanted, such as matches, condiments, axes, extra ropes or strong twine, etc., a goodly supply of clean straw for beds, blankets, flour, smoked bacon, potatoes and apples, besides which a good sized box containing dried unmanufactured tobacco and a number of Virginia clay-head pipes were placed with the other things with the possible hope that some one in the party would feel like taking a comfortable smoke, and the boxes containing our rifles, ammunition and gunning clothes.

The broad wagon body was to be used as a bed-room and the "boys" were to sleep under the wagon.

Selecting the spot for our camp Rube and Jim were not long in getting a substantial lunch ready for the tired party. A suitable corral for the animals was constructed, and at a very early hour all turned in and were soon in the embrace of "tired nature's sweet restorer." Long before the morning sun appeared above the hill-tops to the east of us we were awakened by the sharp, ringing crack of a rifle.

Our first thought upon hearing this sound was that we were encamped near other hunters, but that fear vanished with the immediate appearance of Rube holding by the legs a full-grown, young wild turkey that had paid tribute to the accurate aim of the "boy."

"Oh my! Mass John, you should a seen dat gang (flock)—more 'n fifty ob em—one ole chap wid a goat longer dan dat off mule's tail," said Rube, exultingly lifting his prize and smiling all over the country.

"Where did you find them, Rube?" inquired the Colonel.

"Fo de day break I hearn a tweet-tweet along up de branch (little stream), an' I says to myself, 'Rube, dem's turkeys;' so I takes yer rifle, Mass John, and fotch dis fella back wid me. I foun' dem under dem buches rite ober dar," pointing his finger in a direction northward from us.

"How will you hab im cookt, Mass John?" inquired Rube.

"Suit yourself," said the Colonel, well knowing Rube's skill in the culinary art.

Unpacking our rifles, abluting in the rivulet and donning hunting clothes consumed time, and welcomely Rube, in pleasant tones, announced, "Gemmen, de breakfas' am waiting."

Our breakfast, as prepared by Rube, consisted of bread and butter, potatoes baked under hot ashes, the young wild turkey nicely cut up, the pieces broiled over live hickory wood coals, and tin cups of fine aromatic coffee. This breakfast, for appetites whetted by the shaking of a thirty-mile horse-back ride of the day before, was not hard to take.

He who has never eaten of broiled wild young turkey in the crisp air of east Tennessee has in store for himself a toothsome relish that the gods might envy and before which all the fine "fancies" conceived by the brains of *parlezvous* cooks pale in utter insignificance.

Even now, retrospecting a time longer than I care to mention, as memory brings up the superb satisfaction of that mountain meal, the salivary glands exude copiously, and all subsequent repasts compared with it are as the sound of the twanging of a guitar to the trumpet tones of a great organ!

Oh! ye of poor digestion and nerveless muscles, whose very brains ache at the thought of food, whose lung cells are clogged with the impalpable dust of your offices, hie ye thitherward, and on the mountain top or in the deep valley inhale for a month the health-giving ozone of that lovely country, eat game and kill the game you eat, and my word for it you will come back with a new lease upon life and stomachs that an average saw-mill would be ashamed of! Try it, I make no charge for the prescription. The result of our first day's shoot was one deer and a small brown bear. The deer was cleverly knocked off its legs by Mr. Evans, and Bruin gave up to a combined fusillade from all hands on horseback, he having tried the experiment of climbing partly up a gum tree to escape.

The second day our hunt was more systematic and with better results, the first day being spent more for the purpose of ascertaining certain facts as to haunts, etc., etc.

A careful examination of the valley we were in showed it to be about five miles in diameter. We found evidences of abundance of large game, and ourselves the only gunners there.

Learning this definitely we were free to lay such plans as suited ourselves and to take matters coolly as possible, under no restraint or danger of clashing with others' interests. The valley was practically ours and all that was in it, if we wanted all that was there.

The next day was devoted to a still-hunt for deer. Stands were taken by each one of us before daylight, and the fruit of the work was six deer—a buck and a doe falling to each of the rifles of Colonel Brettle and Mr. Adams, and a doe each to myself and Mr. Evans.

The deer were skinned and the saddles and antlers hung up near camp. Rube's "gang" of wild turkeys were also trailed, and, by careful manipulation, "turkey broiled over hickory coals" was with us a common article of food; for "dat gang" lost numerous members—the "ole feller" among them. That fell to the keen aim of Mr. Adams and the Colonel. The grand climax of our hunt was a day devoted to bear hunting, and resulted in the destruction of three animals. Stealthily crawling to within rifle-shot upon one that appeared to be entirely absorbed in crunching delicious beech nuts, and forgetting for the time that there was a state other than the living, Mr. Bruin stood with his short tail exactly toward me and his nose in a direct line away. A deadly aim, with my rifle resting upon the root of an upturned tree, the report of the piece was answered by a short grunt of pain and bruin fell in his tracks. Examination showed that the bullet, entering the body an inch below the vent, passed through, riddling the intestines, through the heart and emerged at the junction of the neck to the shoulders—not a bone was touched. That bear was killed instantly—was nearly turned inside out! Mr. Evans also got his "work in" on a half-grown cub, as also did Mr. Adams with a larger one. Days were spent one after the other, each one yielding tribute to our rifles. Two days of storm and mist kept us under shelter of the wagon cover. Rube, while not engaged in his specialty of getting up something good for us to eat (and he kept us stall fed), was also on the alert for game. Mornings, long before we were awake, Rube would steal away for a quiet little hunt on his own private account.

One day at dinner he said: "Massa John, dars a *lick* ober yander, 'bout two mile, an' dis mornin' I seed an ole buck leavin' dar wid a head on him 'bout five feet. You jess bet he's a honey!" (Rube's "head" referred to the antlers.)

The Colonel, led by Rube, went to the lick that afternoon, and coming back, reported that he thought we could bag that buck if his instructions were carefully executed.

From Rube's description it was evident that the buck was an old one and as cunning as they usually get when they are old. We must "lay for him" on the windward side or he would never come within rifle range, and his visits to the lick were either in the night or just at daybreak. We were favored by the wind the next evening, and, stationing ourselves at selected points, awaited in breathless silence the approach of the deer. Just as daylight streaked the crests of the eastern hills the sharp ring of a rifle, a little distance down the valley, announced that one of our party had seen game, but it was yet too dark for accurate aim and the shot would at best be uncertain.

"I say, Colonel! There he goes, hup that way," shouted Mr. Evans, as he rushed toward us. "'Ees 'it, though, I'll wager a sovereign."

We decided to wait until it was light enough to see clearly before we gave chase.

Rube went back to camp, and long before he returned, bringing the horses with him, the sun was shining brightly and the trail of the deer could easily be followed over the dewy grass. Going at a lively canter across the valley on the trail to the foot of the opposite hills our chase was brought to a sudden stop by a precipitous bluff, and there he stood at bay—a splendid buck of large proportions, and by his demeanor determined to sell his life at the highest possible figure. We approached as near as was prudent, when two simultaneous reports were instantly followed by the dropping of the head of the deer, the body falling heavily to the ground immediately.

To kill a deer his brain must first be killed; so long as his brain is intact he will run or crawl or show fight. A bullet through his heart is death, but not always instantaneous. Of course, he will bleed to death; but it is well established that a deer with a bullet hole through the heart has run a long distance before he dropped. Severing the spinal cord, whereby the hind quarters lose their nerve force, only paralyzes a portion of the animal, and he will do his best to drag himself away by his forelegs. And won't he "light out" on three legs! Try him, and see. To polish off a deer the shot must be a deadly one. None of your footy flesh cuts will do more than to put new vigor into his already overcharged nervous system and render your chase a stern one. A quick shot while stalking stands about the best chance to bring a deer to bag; for a deer running before dogs has his mind intent on the danger that is following, and will, if not too far away, throw his head high as he baits at the sudden yell of the hunter, thus exposing his most vital parts to aim. But the great secret about killing deer is to be cool as a cucumber, and if you miss your shot don't cuss and cavort around like one wild with nonsense of the put-on-mad sort, but "pick the flint and try it again." You will bag him after awhile, and then you may carry your rifle as you please—muzzle front if you like.

Taking our deer across one of the horses we went to camp. On the way Mr. Adams had a return of bleeding from his

NOTES FROM VIRGINIA—New Kent Co., Va., March 7.—From what I see and hear there is enough of the partridges surviving in this portion of the State to insure a crop the ensuing season. The coveys I have seen were large—in one case exceeding thirty. This is said to be a bad sign, as arguing all of one sex. I don't know that there is any truth in this supposition. Nearer the mountains I fear the destruction has been greater, and in the valley I hear that birds are being bought in South Carolina for re-stocking. The Carolina birds are much smaller than ours, but it is to be hoped they will acquire larger proportions by the transplanting.

You are right in supposing that we cannot surrender the name of partridge for quail or colin or any other however scientific or outlandish. The same as to pheasant. We know nothing of your ruffed grouse.

The terrible tenacity of winter has prevented any angling operations, and we are waiting impatiently for a few days of warm sun and soft breezes.

"HAEC FABULA DOCET"—Boston, Feb. 28.—I was greatly amused by an article in your last issue which described the final ejection of a swab from a rifle barrel by "heating the barrel some four hours till it was red hot in the fire and burning the imprisoned swab to a cinder." It reminded me of one of La Fontaine's fables of "The Bear, the Man and the Fly," in which the playful, tame and loving Bear smashes in his master's skull with a huge stone to kill a fly upon his nose, which he, the bear, fears may trouble his master's slumbers. In the recital referred to above, it is stated that the operators tried to eject the swab by using an "iron rod" but were unsuccessful. Now, it seems to me, if they had repeatedly heated this rod red hot and inserted it into the rifle barrel they would have obtained the same results without doing any injury to the rifle. The *savoir faire* of some of our hunters is wonderful.—FUSIL.

AUDUBON GUN CLUB.—The semi-annual election of officers of the Audubon Gun Club took place last evening at their club room, 1226 Broadway, Brooklyn. Robt. T. Sabine was elected President; C. W. Field, Vice-President; James Heming, Secretary, and C. W. Twing, Treasurer. The club elected as members of the Executive Committee: L. B. Field, P. Post and J. F. Scharfenberg. They will hold their next contest for the club badge on Thursday, the 10th inst. This association has only been in existence since last September and now has a membership of twenty and bids fair before the next election to double its present number. Its finances are on the credit side of the account, and the club is in a very happy state of affairs generally.

Brooklyn, E. D., March 8, 1881.

AIR GUNS are a *sine qua non* in a cat infested city. Unfortunately the use of the air gun is for the most part confined to the shooting gallery when it should be used in the back yard to bring Grimalkin down from his discordant perch on the garden fence. If there were half a dozen of Mr. H. M. Quackenbush's air guns to every block in New York the cat problem would be settled without Mr. Bergh's proposed home for vagrant, aged and orphan tommies. If Mr. Quackenbush's notice elsewhere shall be the means of decreasing the feline population of the world that gentleman should be rewarded as a public benefactor.

POACHERS PUNISHED—Williamsport, Pa., March 5.—I send you by this mail one of our local papers with a marked article referring to the arrest by the Lycoming Sportsmen's Club of three individuals for killing a deer out of season. One of the parties arrested and fined is a notorious poacher, who has, perhaps, done more to exterminate the game (especially feathered) in this vicinity than any other ten men combined; let us hope the lesson given him by our club will have the desired effect, for if he is again caught tripping he will fare worse than on this occasion.—LYCOMING.

DEER IN MICHIGAN—Escanaba.—I frequently receive letters from sportsmen asking about the deer supply. Parties outside, it seems, think we are killing so many deer here that it must affect the shooting. We have very fine deer hunting. There is a large range north and east of us that is not hunted. I think (average seasons) there is as many deer fawned as killed. Deer are not as plentiful in some localities as they were a few years ago, and some people think they are decreasing rapidly; but the fact is, they are wintering further north and east as the timber is cut away. This will be a hard winter for deer—deep snow and more wolves than we have had for years. People understand there is no bounty on wolves, consequently do not hunt them.—R.

DUCKING ON THE NIAGARA RIVER.—Lord George G. Campbell, brother of his Excellency the Marquis of Lorne, and Lady Campbell, accompanied by Mr. D. Isaacs, of the Prospect House, Niagara Falls, left on Monday evening *via* Canada Southern Railway for Niagara to enjoy a couple of days' duck shooting. Lady Campbell always, as far as possible, accompanies her husband on his shooting expeditions, as she is fond of the sport. Just now the duck are very plentiful on the Niagara River, and yesterday the gentlemen bagged ninety-three.

FLORIDA QUAIL—Tallahassee, Fla., Feb. 24.—Although we have experienced the most severe winter known here for twenty years not a quail has been frozen, so far as I can learn, and the prospects for next fall's shooting is excellent. An average shot with a good dog can bag forty to fifty birds in a day's shooting. The shooting at this time of the year is especially good as the fields are being plowed and the birds are taking to the hedges, and with a good dog one can have fine sport. The only trouble here we have is that the negroes trap the quail in such large numbers.—DIXIE.

TENNESSEE NOTES—Koshoell, March, 7.—Snipe have already made their appearance in the marshes about the city; quite a number have been bagged, but from some cause or other they are very thin. The cold winter has been disastrous to quail in many parts of the State, hundreds of them being reported frozen. Venison in large quantities has been in our market, though ducks and wild turkeys have been very scarce.—J. D. H.

WILD PIGEONS IN TEXAS.—Last week two hunters, Arch. Murphy and W. C. Scott, went to a pigeon roost in Wood County, N. E. Texas, and in less than eight hours' hunting they killed and brought into camp one thousand and fifteen pigeons. They are also reported roosting by the million in the vicinity of Lime Stone Gap across Red River in the Indian Territory.—H. W. M.

QUAIL FOR NEW JERSEY—*Editor Forest and Stream:* The West Jersey Game Association is making efforts to secure one thousand quail from North Carolina to liberate in the five lower counties of the State. It is doubtful now that so many birds can be obtained; two hundred and fifty pair, however, I believe, have been assured the society. This association is ever foremost in active work for the protection and preservation of game, and many of its most prominent members are residents of Philadelphia, in fact, it seems that our city furnishes the backbone of the society.—HOMO.

A GAME DEPLETED COUNTRY—Tidioute, Pa.—Warren County is one of the "played out" resorts. Formerly we had grand deer hunting ground, but now sawmills are being introduced all through the big woods, and those mills are manned (for the most part) with lawless and soulless marauders, who kill everything in season and out of season, until now the best hunters will not average one deer per week with constant hunting; whereas, ten years ago seven to ten would fall before one gun in the same time.—E. A. B.

MISSOURI, Parkville, Platte Co., March 10.—A friend and self have just returned from a hunting tour among the lakes in this vicinity. Ducks and geese are plentiful but hard to get at. Squirrels are scarce; a few can be found on the bluffs Rabbits are quite numerous and afford good sport. Ruffed grouse and quail are rarely seen here; they are not protected, and hence are almost exterminated.—PRINTER.

ACCOMAC CO., VA.—March 12.—There are plenty of geese in the marsh ponds and the black ducks are beginning to return. The quail have fared badly, not being used to such cold and snows. Found a dead night partridge (woodcock) several days ago.

WORTHINGTON, IND.—March 8.—The quail have been almost destroyed. It will be many years before birds are plenty again; where two years ago there were hundreds, one cannot be found. The prairies are wet, but we expect snipe shooting later on.

LOGAN, HOCKING CO., O.—March 12.—Last winter was a "corker" on the quail. Many bevies have been found in the bottoms frozen to death.

MASSACHUSETTS.—The sportsmen of Springfield, Mass., and vicinity have captured over one hundred foxes this season, and the end is not yet.

PENNSYLVANIA—Philadelphia, March 12.—Two or three snipe were killed on the meadows bordering Darby Creek, near Philadelphia, last week. In some places, however, the marshes have not entirely thawed out. To-day many redheads reached Philadelphia per rail from Havre de Grace and shooting there is reported very good. Our river ducks being shipped by gunners to the city are in very poor condition yet, the ice on the flats this winter having carried off and destroyed the usual vegetable matter which supplies them with food.

NEWPORT—R. I., March 5.—John H. Chase, a fine rifle shot of Portsmouth, was out shooting last week. As he fired at a muskrat in the water another stuck his head out of water in range and he killed them both. He says he never heard of the like being done before with a rifle ball.—SHOOTER.

NEW JERSEY—Hightstown, March 12.—Woodcock were heard here on the first of the month.—P.

N. Y. S. ASSOCIATION.

THE committee on literature are getting up an elaborate programme of between one and two hundred pages to be bound in boards and printed on a delicate, cream-laid, tinted paper. For the outer cover a design is being prepared by one of the finest artists in the country under the supervision of Mr. S. S. Conant, of Harper & Bros. In this book a complete history of the New York State Association for the Protection of Fish and Game will be printed. It is also desired to obtain the accurate scores of prize winners at the trap, and any one who can give any information, either in regard to scores or to the history of the Association prior to 1865, is respectfully asked to correspond with Mr. Abel Crook, Bennett Building, New York. As there is no authentic record, the Committee would like to obtain one as complete as possible so as to make the programme a book of reference, and the earlier any information is furnished the better, as it will involve considerable labor in the compilation of it. The committee propose to take a limited number of advertisements at the rate of one hundred dollars a page to help defray the expense of getting up the programme. Donors of prizes will be allowed an advertisement free, provided they will furnish a suitable cut for the same.

Prizes are being received very rapidly; orders for about forty having been received and placed on file, the aggregate value of which is four thousand dollars. Among others which we are authorized to announce are the following:

The Brooklyn Furniture Company are manufacturing a parlor suit of ten pieces of furniture covered with satin damask and elegantly carved, and valued at one thousand dollars, the damask alone costing two hundred and seventy-five dollars. It is intended that this prize shall be offered for individual competion, and is the largest prize ever offered at a state tournament.

The Le Roy Shot and Lead Manufacturing Company have donated a bronze, representing an American hunter on horseback shooting a bison. The design is by Bonheur, brother of Rosa Bonheur, and possesses that characteristic treatment of animals for which that artist is so famed. It was prepared by Tiffany in whose windows it is on exhibition. It is valued at three hundred dollars. Messrs. Parker & Bros. are manufacturing a gun expressly for the occasion, which they assert will surpass anything their factory ever turned out. It is to be specially built for trap purposes, and of the finest Damascus steel, thirty-inch barrels, ten gauge, between eight and nine pounds in weight, and is to be gold mounted with a rib engraved as follows: "Prize N. Y. S. A. for Protection of Game and Fish, 1881."

The other prizes include articles both useful and ornamental, descriptions of which we will give hereafter from time to time.

No cheap prizes have been accepted, the Committee arguing that it would be unfair to donors of valuable prizes to permit the character of donations to be weakened by such a course. The system which has been adopted, and is working admirably, is as follows: No donations is entered on the books until all correspondence is ended by the receipt and filing of an accredited order for the prize. If any conditions are attached to a donation the Committee reserve the right to return the same to the donor if it should be found impracticable to comply with the conditions. No donation will be accepted unless it is in some way appropriate, and such as shall be acceptable to a winner. Also, the Committee propose to place an honest cash valuation on each prize so that a winner will know just what he has won. Between the middle of April and the first of May all prizes are to be delivered to the Committee, and will be exhibited by the Brooklyn Furniture Company at their warerooms on Fulton Street, opposite Hanover Place, Brooklyn. This company has prepared the most attractive show window that could be found either in New York or Brooklyn. It is entirely of plate glass, with a frontage of thirty feet and a depth of sixteen feet. It is to be carpeted in Wilton and arranged in parlor form, lighted by a chandelier of many lights. Pier glasses will be placed at each end and artificial windows with Madras hangings, loaned especially for this occasion, valued at eight hundred dollars a pair. Within this crystal palace the suit of furniture donated by them will be placed, and all the other prizes displayed in such order and upon such arrangement as will please the eye and prove most advantageous In May a formal opening will be had, to which the donors and members of the press are invited, and a suitable collation will be furnished. Those who are contemplating entering prizes should decide without delay, as it is estimated that the preparation of the book that is to contain the programme will require at least a month, and the Committee feel that in justice to the donors the book should be distributed as early as possible. We are informed that about one thousand dollars in cash has been presented to the prize Committee to use as they see fit. The bird problem appears in a fair way of solution several responsible parties having solicited the contract. The number of birds required is estimated at twenty-five thousand, and any bids for the contract should be forwarded at once to Mr. Crook, who will place them before the Committee on Birds.

LONG ISLAND GUN CLUBS.

Wednesday evening, March 9, the Coney Island Rod and Gun Club held its meeting at the club rooms, No. 451 Flatbush avenue, President W. L. B. Stears in the chair and Secretary Geo. L. Ayers recording. There was a large attendance of members. Mr. C. W. Wingert, who had been appointed to procure a championship club badge, produced an elegantly designed gold badge and reported that it was ready for presentation to the member who had been successful at the last meeting. The conditions under which the badge is to be won are that the member who wins it most times at the twelve monthly competitions is to have it as his personal property at the conclusion of the year.

The chairman, in an able and pleasant address, presented the badge to Mr. Theodore Alston, who, at the first competition which took place last month, killed seven birds straight.

Mr. Alston responded, and was congratulated by his fellow members on his success.

A case of stuffed birds was presented by Mr. J. Batty to be shot for on the 16th inst.

Mr. C. W. Wingert presented a handsome gold pin to be shot for in April.

Mr. Robert Furey presented a ten dollar gold piece to be shot for in May. The thanks of the club were tendered the doners.

The following new members were elected: Daniel W. Northrup, Wallace W. Samuels, C. J. Glover, Harry Deginee, T. Sidebotham, Harry Brown, James O'Connor, Harry Hass, J. B. Stearns, G. C. Marsters, Benjamin Baker, B. G. Thier, William Booth and George Kinnel. The names of thirteen applicants for membership were received. The Secretary reported the number of members to be 143, which, considering that the club only started November 11 last, is a good showing.

After the formal adjournment a fine collation and entertainment, consisting of singing, etc., concluded the evening's proceedings.

The Long Island Shooting Club has filed its annual report in the County Clerk's office. The membership of the club is seventy-eight, of whom sixty-one are in good standing. The receipts of the year were $678.46 and the expenditures $527 14, leaving a balance of $151.29. The total amount of club asserts are $1,180.33.

INFORMATION WANTED.

HISTORICAL QUERY.—W. M. H., 712 Market street, Philadelphia, Pa., would be glad to get a letter from some one who can tell him accurately in what organization of the Confederate Army the lance was used. (This weapon is about nine feet long, the Confederate States flag being attached to the staff near the steel spear-point. The pike for infantry of various shapes was usually heavier and longer, as to its point, than the lance. Were many of the pikes used?) This correspondent was a soldier—then as now a lover of historic things. He has two great boxes of these lances. The boxes were addressed to "Capt. Getty, Lynchburgh, Va." He would like to learn who this officer was and exactly where these curious weapons were abandoned or captured. A letter or postal addressed as above would reach the historical student aforesaid.

MINNESOTA SHOOTING.—C. E. W., Troy, N. Y., asks (1) where he can find best deer hunting within 150 miles of St. Paul, Minn.; wants board, preferably with some one who understands sport. (2) Resort for deer, ducks and geese in Otter Tail County, Minn., with board. (3) Sporting centre, with board, on line of St. Paul, Minneapolis and Manitoba Railroad.

BEAUFORT.—"Subscriber" asks: (1) What is the range of the thermometer at Beaufort, N. C., in winter and summer? (2) Is the climate healthy, or subject to malaria and fever and ague? (3) Is wild fowl and general shooting good in its vicinity?

A READER of Pittsburgh desires to know the nearest point to Pittsburgh, Pa., where live quail for breeding purposes can be purchased.

THE WICKERSHEIMER FLUID.

BOSEMAN, Montana.

WILL the "Fish Editor" of FOREST AND STREAM please advise me as to best manner of preserving bear skins. Conceding they have been "pegged out" and cleaned of most of the flesh and fatty matter, what is the best preparation to apply? I have usually used common salt, but am told that will always attract moisture. Have also used alum and salt. I have an objection to using arsenical soap or any of the salts of arsenic. I have supposed on reading your article on the "Wickersheimer Fluid" that it was a good preparation, but that would be a very bulky article to take into the mountains in a pack outfit. At any rate I should like to get your advice as to the best method, preferring, of course, it in a solid form that could be easily "packed" and mixed up in the field. I killed six large grizzlies in these mountains last season well furred, and fear the fur will slip for want of proper treatment, and don't wish to be unprepared the next trip. P.

[The "Wickersheimer Fluid," the formula of which was given in FOREST AND STREAM of Nov. 4, 1880, has been misunderstood by many correspondents. We do not consider it of the slightest value for preserving birds, as objects preserved by it remain flexible. It is of great value in making skeletons which are held together by natural ligaments; for preserving insects, spiders, crustaceans and perhaps fishes for museums. It may be of use to the taxidermist in case of skins, but we know nothing of its use in this manner. The skin would remain flexible, and the moths would probably avoid it, but whether it would retain the hair or not we cannot say. There has been a great demand for copies of the paper which contained the recipe, but we have no reports from those who have used it in this country. In a week or two we will give our readers another formula for a preserving fluid, which, like the other, comes from Germany.

A mixture of one-third (by measure) alum to two-thirds salt is used and recommended by taxidermists for preserving the skins of mammals.]

Sea and River Fishing.

FISH IN SEASON IN MARCH.

FRESH WATER.

Pickerel, *Esox reticulatus.*
Pike or Pickerel, *Esox lucius.*
Pike-perch (wall-eyed pike) *Stizostethium americanum, S. griseum*, etc.
Yellow Perch, *Perca fluviatilis.*
Striped Bass, *Roccus lineatus.*
White Bass, *Roccus chrysops.*
Rock Bass, *Ambloplites.* (Two species).
War-mouth, *Chænobrytus gulosus.*
Crappie, *Pomoxys nigromaculatus.*
Bachelor, *Pomoxys annularis.*
Chub, *Semotilus corporalis.*

SALT WATER.

Sea Bass, *Centropristis atrarius.*
Striped Bass, *Roccus lineatus.*
White Perch, *Morone americana.*
Smelt, *Osmerus mordax.*
Pollock, *Poliachius carbonarius.*

A SUMMER FISHING TRIP.

ARE you an angler, reader? If you are not I assure you there are some of the real pleasures of life which you have failed to discover. I fancy I see those of my friends who practice the craft seated before warm fires in some cozy library, during these cold evenings, with their materials, pleasant reminiscences of past sport, scattered around in confusion.

And while they assort and reassort their gaudy flies, hooks and tackle, they are busily thinking over the past season, and planning for the future, meanwhile I will endeavor as a brother angler to interest you for a time with an account of a trip which I had the fortune to make.

The heat in the city had become intolerable, and the feelings which my friend Jack and myself experienced when we found ourselves spinning away were far from unpleasant. Where we were to go was unsettled, plan we had not, and so after drifting around fashionable watering places, idling away our time in dancing and making imaginary love on one day, and on the next, interviewing ancient maidens and petrified sandwiches at the railway stations, tired and weary at last, one quiet Sunday morning we tumbled into that quaint, old-fashioned town of Quebec. The fact was, we were dying of *ennui*, and having been in this interesting old spot many times before, of course Montmorency Falls, French cathedrals and drives had lost all charms. In this frame of mind we sauntered along the promenade of Dufferin Terrace.

Jack threw himself into a seat, and while he puffed out huge volumes of smoke, commenced to dream of the pretty girl who had played on the guitar during the voyage down from Montreal, and forming daring plans for her romantic rescue and marriage. I lounged over the railings—hundreds of feet below was the street, with the busy people hurrying to and fro, then the shouting stevedores on the wharves, and beyond lay the swift running river, glittering in the morning sunlight, with its ships riding at anchor, and innumerable little boats darting hither and thither. A pleasant picture, yet withal so soft that I gradually lapsed into some pleasant day dream, leading huge vessels high into the air by a slender spider's thread. A hand was laid on my shoulder, turning quickly, before me stood an old friend and as true a disciple of the Waltonian school "as ever threw a fly." He had heard that we were in town, he said, and proposed to send us away on a fishing trip immediately. "Capital!" we shouted, and of course soon were in possession of all necessary knowledge. In the gray light of the following morning two muffled figures might have been seen hastily descending the steep street which led to the wharf of the Saguenay steamers. We are in time and hasten aboard. The morning is still young, and the old city has not yet thrown off its garb of sleep. One faint star twinkled in the hazy sky, the rumble of some early moving wagon and the roar of escaping steam alone break the stillness of the hour. A few discordant sentences of Canadian jargon, a shrill whistle, a splash and rumble, and we are off. The wheels turn slowly round, dense masses of black smoke pour from out the funnel, and the steamer swings out into the rapidly running river.

Soon feeling the current she lazily begins to float down that grand river, the St. Lawrence. Swiftly we pass the many yards of rafts which line the banks, fainter and fainter appears the city, one by one the lights still burning fade out, and soon the outlines of the tallest spires sink in the sombre mist which is hanging over all. The isle of Orleans is reached, and as we pass the lower end the sun bursts on the picture. We had gazed upon the beauties of the river to our heart's content, watched an energetic man waste time and ammunition in scaring porpoises miles away, and finally settled down to our novels, the usual solace of such trips. It was quite late in the afternoon when we reached one of those towns built in early times, and of which so few remain untouched by modern hands.

The beauty of the scene was striking. Before us appeared an ideal representation of one of those antique and lovely Acadian towns so admirably described by Longfellow:

> "There in the midst of its farms reposed the Acadian village;
> Strongly built were the houses, with frames of oak and of chestnut,
> Such as the peasants of Normandy built in the reign of the Henries.

A long, clean pier of white stone led to the houses. There nestling among the green trees, with here and there a sprinkling of red and gold, with the misty blue hills for a background, lay the town that quiet summer day. From among the houses with the blue smoke here and there curling slowly upward, came occasionally the shrill bark of a dog, the crowing of a cock or the gentle cooing of a dove, while the busy dame of the house, appearing with her pail of milk, proclaimed the near approach of evening. A shrill whistle jars upon our pleased fancy and brings our thoughts reluctantly back to the scene around us.

The planks are drawn in, and once more off we are hastening on our journey.

The Saguenay River is soon reached and we begin to ascend. How sombre and magnificent it all appeared when late at night we reached the place at which we were to fish and prepared to leave the steamer.

We hastily jump into our canoe, the steamer slows and stops. "Cast off," some one shouts, and as the rope comes whistling toward us we cannot help thinking that the last tie which holds us to the civilized world has been broken loose.

Instantly we fall astern and away goes the steamer sending out showers of fiery sparks and casting a red glow on the adjacent mountains. The dull patter, patter of the paddle wheels, and the roar of the trembling furnaces at last bid us farewell as the red light of the steamer disappears around a projecting bluff. The only sound which breaks the stillness of the hour is the musical ripple of the waves upon the rocky shores. The moon comes out from behind a dark cloud and lends a glittering sheen to the rippling surface of the inky water; the barren mountains tower above in majestic grandeur, while at their massive bases long, dark, mysterious shadows flit with ever varying outline. Gradually other sounds are to be heard—the "hoot! hoot!" of some solitary owl, and the blowing of a porpoise far away. Stretching out before us was the land kissing with its green and velvet carpet the inky river, and losing itself in the misty blue background.

A faint light glitters among the trees and toward it our canoe rapidly shoots. * * *

The sun is shining brightly in the morning as we step into canoes which are gently grating on the sandy shores awaiting our departure. Dip, dip, dip, and away we go up the dancing waters, up past rows of pine and cedar, past falls and rapids, past pools, where gaily playing trout show their glittering sides, until we reach our fishing grounds. Seldom does one meet with such beauty and grandeur as are possessed by this stream.

Mountains, some of solid rock devoid of all living things, others in beautiful hues, stretch far, far away, while the babbling brook, seeming to sing Tennyson's song—

> "I come from haunts of coot and hern;
> I make a sudden sally,
> And sparkle out among the fern
> To bicker down a valley"—

winds sparkling and dancing through the misty hills.

As we advanced up the river how soft the scene! The canoe advancing silently or cutting the rapid water with a merry gurgling noise, the trout and salmon jumping and showing their glistening sides and the plaintive note of some sweet songster manifest that peaceful and quiet happiness which is Nature's greatest charm.

And now we determine to commence work in good earnest. And so with that intent I assort my flies, joint my rod and adjust my line for the encounter. For this pool I will use my favorite cast—No. 1, a fairy; 2, claret; 3, ginger hackle. You all know the favorite spot at a glance, and in it recognize the home of the wily trout. The river, rushing round a mossy point, broadens into deep and placid water, on whose cool bosom the lowest branches of the drooping trees ever so lightly dip, and then the banks, approaching near to one another at its lower end, cause the water to dash precipitately away.

You have caught the sly trout, my readers, and you know well the method. Cautiously approaching and pushing the alders aside, with ever so gentle a noise, the flies light on the water. For a moment, silence; then, as you draw them toward the bank, a rush comes, a splash; with rapid darting he turns and runs, and the waters boil, but at last he is yours "Ah! not such a large one as I thought," I hear you exclaim. But there are many more no larger than he with whom you deal,

> "Some lightly tossing to the grassy bank, and to the shelving shore
> slow dragging some."
>
> "But should you lure
> From his dark haunts, beneath the tangled roots
> Of pendent trees, the monarch of the brook,
> Behooves you then to ply your finest art.
> Long time he, cautious following, scans the fly,
> And off attempts to seize it, but as oft
> The dimpled water speaks his jealous fear.
> At last, while haply o'er the shaded sun
> Passes a cloud, he desperate takes the death,
> With sullen plunge. At once he darts along,
> Deep-struck, and runs out all the lengthened line;
> Then seeks the farthest ooze, the sheltering weed,
> Then the cavernèd bank, his old secure abode.
> With yielding hand
> That feels him still, yet to his furious course
> Gives way, you, now retiring, following now
> Across the stream exhaust his idle rage:
> Till floating broad upon his breathless side,
> And to his fate abandon'd, to the shore
> You gaily drag your unresisting prize."

But much as one enjoys the pleasure of angling, how indispensable is the following meal! Who does not remember that enjoyable day when he caught and ate his first trout? The soft winds from the waters playing round; the odors of the flowers, and the general surrounding of the place, all go to make the effect lasting in your mind.

It afforded me a great deal of amusement to suddenly come on Jack one morning as he was fishing, and I soon discovered the secret of his catch of large fish Having caught out all the smaller trout he still lingered, maintaining that there was always one or two large ones which he must have, and so I watched as he labored to secure them. First he tried the hackles, going through them all; then an ibis, and a claret and a fairy, a coachman, an alder, a gray drake, and finally with a huge white miller, and he has him.

We had fishing on the river for five miles, making some large hauls, and we pined for a change.

One afternoon a half-breed made his appearance, and from him we learned that he had discovered a new lake from which he maintained that he had taken a barrel of trout in two hours. Although we sincerely doubted his veracity we nevertheless sallied forth with our canoes and men to investigate Dark Lake, the one in question, was in the wilderness surrounded by muddy ground. After embarking we found the water to be only a foot and a half deep all over and with a muddy bottom.

Assiduous Jack explored every conceivable nook, whipping diligently the while, but with no success. I was also unfortunate. About to give up in despair I made a chance cast toward an old log when—goodness gracious—the water fairly seethed with trout. Jack soon steamed up, and together we made that nasty muddy little hole yield sixty-four pounds of fine trout in almost an incredible time. Where they ever came from, as the natives say, "Je ne sais pas." But our tackle got short in the matter of trout flies, and so we must needs stop. Let me here advise all my friends who may read this article either to take a good fair supply, or else master the art and take materials for making their flies. I mention this latter since I am myself a maker of flies, but on this occasion foolishly left materials behind. There yet remained only a few days, and this we devoted to salmon fishing. One can never forget the first salmon he caught.

The pool was near at hand and cautiously we approach. "Cast there," says our canoe-man, and forthwith our line, with a "king of the water" fly, gracefully alights. "Um good," he says. Well, I should say so; for suddenly splash goes the water, and out he comes, then swish, and with a whiz the line is gone, and the rod is merrily dancing to music from the buzzing reel. Now he darts savagely away, but check him gently—care is the word. How he rushes and tears, now up, now down, with many a jerk and plunge. But the line is strong, and we are in no hurry. Soon we think he is ours. No, not yet; his death struggle is at hand and he grows weak.

Noble fellow! he has striven hard to be free. Slowly reel him in, and in an instant the cruel gaff is in his side. He lies on the bank half dead, a fifteen-pounder, and my first!

Dear reader, there are many pleasures awaiting you if you will but stretch forth your hand. If you have never been one of the angling brotherhood I would that I could allure you away from hot and crowded watering places, from indigestion and insomnia to pur recreation, that you too could breathe the air perfumed with the sweet smelling woods and flowers, feel the cool breezes loaded with odors of pine and balsam, taste the icy waters of the spring stealing from its cover of mosses, partake of refreshing sleep and food, and live, aye live, as only those do who live under the tent of nature. But such pleasures cannot always last, and we must sadly pack up and return. We presented our men with many pounds of fish for their winter use, right glad to get in exchange for them health and vigor in our bodies. We embark and resolutely turn our backs upon the spot. As each stroke of the paddle brought us nearer the noise and bustle of civilization and left behind us the sweet flowers and the bright birds we could not help feeling much of the same spirit which prompted old Izaak Walton to write so aptly,

> "I in these flowery meads would be,
> These crystal streams should solace me;
> To whose harmonious bubbling noise
> I, with my angle, would rejoice."

There are many attractions offered to weary business men for summer enjoyment, but if you really want sport please remember how "I went a fishing," and do likewise.

C. Trout.

BOBBING FOR EELS

BY COSMOPOLITAN

BRETHREN of the rod, turn not up your nasal protuberances in contempt for this homely sport, for when tired of fishing in the legitimate manner, much amusement may be had in the long summer evenings by bobbing for the slimy though nutritious eel. One pleasant summer—ah, what pleasant memories hover round the words—the two colonels and myself had fished for striped bass an I weakfish and caught so many that the caterer of the mess swore that no more fishes should be brought to the house; and, looking for fresh fields and pastures new, old Bris suggested, "Why not bob for eels; the work of the day will be over; we can take the Black Maria, with Hunter to pull; have a good supply of creature comforts in the shape of cigars and lemonade; lie back in the boat, take it easy and get lots of fun?" "Agreed," said Van, and Pills, nothing loth, also assented. Fortunately, in our bag of sand in which we preserved our salt water worms (*Nereis*), a goodly number still remained of the vermicular beauties and we set to work to make the bobs—for it should be mentioned that without bobs, bobbing would be a failure. Thread may be used, but silk or worsted is better, and this is the process: A piece of ligature silk, four feet long, doubled, is threaded through a large, long needle; the worm is transfixed—end for end, as the sailors say—and is pushed to the end of the silk, another and another, until the entire length appears like a gigantic worm; both ends are fastened with knots, the string doubled and doubled in itself and tied in the middle, leaving on each side a bunch of wormy flesh the size of a child's hand. These are the bobs, and very enticing they look; and if made of the salt water worms are much better than the ordinary angle worm kind. Hunter was directed to have the boat in readiness at 8 P. M., and at that hour we started, Van and I in the stern, Bris in the bow and Hunter in the middle. The boat was anchored about twenty feet from the sea-wall of the fort (Wood) in five feet of water; we light our cigars, arrange our bundles of worms, tie a sinker to them, fasten them to the two upper joints of our rods and cast overboard. Hunter, an old "shell back,"—a soldier in name because of his enlistment, but a sailor all over—disdaining such trifling, looks as contemptuously as he dares at the eager satisfaction depicted on his commanding officer's face as he feels the first nibble.

Hoop-la! Out came Bris' line and on the bob a little eel not much bigger than one of the worms he had tried to devour. A silent snigger from Van who, laid out in the stern sheets, seemed to pay more attention to the stars than to his line. A splash and over went his rod, a rousing big fellow having seized the bait and dragged the pole from his lazy hands. Fortunately the line fouled with the anchor rope and it was recovered, and, when hauled in, had an eel still attached to it which probably weighed not less than two pounds. Whisk! and Pills pulled out a big one; and in his haste to secure it striking the coxswain across the face, who at once spit to leeward, shifted his quid and anathematized his eyeballs (or ours) most heartily. Next take for the infantry colonel, who this time secured an eel so large that he was obliged to haul him in by the line for fear of breaking his rod, when it was found that the animal's teeth were so fixed in the fibres of the silk that he could not be shaken off, and it was necessary to decapitate him before the bob could be used again. This operation was performed by the cheerful and long-suffering Hunter, who, after a severe tussle of some minutes, succeeded in hacking off the head and getting himself covered with slime from head to foot. More anathemas and a relapse into a sullen silence only broken by the constantly repeated hauling in of snaky-looking victims. It is an actual fact that no sooner did he bobs touch the bottom than the eels would go at them with a rush, sometimes two, even three, being captured at one time. After an hour or so of this kind of work we rested awhile before putting on fresh bobs, and Bris sung us his favorite song, the chorus of which ran as follows:

> "Oh, the death of my poor children,
> Oh, the death that they did die;
> Some got drunk and some got drowned,
> Some got choked with chicken pie."

Those of my readers who have traveled West will doubtless recoguize these familiar words. We resumed work again, and for another hour hauled in eels until the bottom of the boat was covered to such an extent that we were obliged to keep our feet on the gunwale to prevent the "riptyles," as Hunter called them, from climbing up our legs. At length my patience gave out, and I mildly suggested to our amiable commanding officer that we should give up our sport for the night and pull to the wharf.

"No, sir," he replied. "I don't go in until I have filled this boat with eels."

Over poor Hunter's face a smile was seen to gleam when I made my proposition; at the colonel's response he became gloomy as midnight again.

"Well, I'm going ashore," said I, "If I have to wade for it."

"No, sir; I command this boat. You must see the fun out. Obey orders, even if you are to be devoured with eels. Did you ever hear how our old friend the general, who by this time is peacefully asleep in his cot in yonder fort, obeyed

orders? No? Well, I will tell you; and let the story of this old veteran be a lesson to you. It was during the battle of Molina del Rey, and General Taylor, seeing a certain part of his line exposed to attack from a quarter not expected, sent an aide for a young captain of artillery, who, quickly approaching his chief, received the following order: 'Captain Burke, take your battery to the field over the hill to the right. Keep the enemy in check and remain there until I rescue you.' The artillery man touched his cap, cantered off, had his battery limbered up and off at a gallop. The day was won and sunset saw the complete discomfiture of the Mexican host. Captain Burke did not put in an appearance and many surmises were made as to his fate. The next day passed and nothing was heard of him, and General Taylor was heard to say that he could not understand what had become of him. An officer near by remarked that perhaps no order had been sent him to abandon his position. 'By Jove, sure enough! One of you fellows ride out and see if he is still there and, if so, order him in.' Sure enough, there he was; and would have been to this day if he had not received a command to retire. Talk about Casabianca! bah—Lord! what an eel!" and in came another one.

We fished until nothing was left of the bobs, and at 1 P. M. returned to the fort, our boat certainly one-third full of eels—a loathsome, squirming, slimy mass, enough to sicken one; but the colonel was delighted, for said he, "We will save a whole day's rations and feed the men on them; they won't be lost." We stopped at the sutler's to refresh the inner man and while sitting over our beer and cigars the colonel told the following story, which, although it may have been in print before, is well worth repeating. It is apropos of the eel:

"A wagon drove up to the cottage door and a quiet, gentlemanly visitor descended who knocked and was admitted by the good woman of the house. 'Widow Jones?' said he. 'No widow,' said she—'Mrs. Jones.' 'Widow Jones,' said he, 'the eels are outside—two barl's of them.' 'Where did they come from?' said she. 'Outer the old man—fell in the creek—drowndead.' 'Good Lord!' said she, 'bring the critters into the kitchen.' 'All right,' said he; 'what shall I do with the defunk?' 'Wall, I kinder guess the best thing to do would be to take him back and set him agin,' and she wiped a big tear from her glassy optic."

After this to bed and dream all night of eel bobbing and tussles with enormous monsters.

For the benefit of our friends living in the vicinity of New York it may be remarked that the locality where we fished is off the sea-wall at Fort Wood, Bedloe's Island, New York harbor.

TRIP TO MADAWASKA LAKE AND ITS SOURCES.

LEAVING the comfortable and thriving village of Fraserville, Me., at 2:15 P. M. on a bright day in August in the mail conveyance, under the care of my esteemed friend, John Turner, a veritable sport, we soon found the aroma of birch in the air after the recent shower of rain, and the roads being in splendid condition, we got along finely at the rate of eight miles an hour; and after changing horses at St. Louis, du Ha Ha, and satisfying the cravings of the inner man, we continued our journey through mountain gorges and thick forests, glorious to behold, we arrived at Lake Madawaska at 12:45 P. M., having made our journey of eighty-one miles in eleven hours, including stoppages.

The Lake was now at our feet, basking in the moonlight, and to me it seemed like a little sea, the shores opposite being almost too distant to see, as it was forty-one miles long.

However, to bed we got, and enjoyed a good night's rest from our hospitable host, Clem. Barebec, and a trout breakfast in the morning, and 6 A. M. saw me, as my friend Turner took a different route after bear, with two guides engaged, and canoe, tent blankets and all the necessary camp fixings, including a splendid rifle and twenty rounds of ammunition I got the use of from my friend, Col. Theriault, who lives on the river Madawaska and owns a farm of three miles along the edge of the lake, and one and a half miles deep, and is a thorough Nimrod. All being in readiness we started at 7 A. M., and by 12 o'clock dined just five miles up the river which is, up to this point, a succession of rapids and falls, and the water being low we had to do some immense dragging with our loaded canoe, and to be careful not to stave a hole in her. Well, we relished our dinner of trout which I caught while the guides were preparing for dinner, and soon after continued our journey. Having got over the worst part of the river the task was now a pleasant one, using the paddles all the time. The river here widens into a lake of about five miles long and half a mile broad at the widest part, with plenty of ducks all around, but too wild to get at. Saw immense flocks of young ones unable to fly, but which got through the water at a terrific gait; also lots of what the guides told me were fish eagles. I shot one which passed close by the canoe, and he measured from tip to tip of wing five feet four inches, of a darkish brown color and a beautiful crested head, and immense talons. I preserved the wings alone. After passing through three miles of river, whose waters were without a ruffle, and whose shores are forested with cedar, maple and birch, we entered the second lake, seven miles long and about one mile broad, slightly timbered with cedar; and leaving it we again had the river before us for five miles more, and 7 P. M. saw us in camp at La Fourche, the head of the main branch of Madawaska River and twenty-five miles from Lake Madawaska. We had quite a time during the early part of the night, shying pieces of wood at the hares which came around the camp, attracted by the fire. The guides managed to bag two of them, and they made a very palatable breakfast.

Here at La Fourche the river has three different branches, one of about four miles and another three miles long, both being fed by smaller streams; the third branch fourteen miles long, fed by "Eagle Lake," a great beaver district. We took the "Eagle" branch, and after going up for about four miles found the river jammed by logs piled some forty feet high and about a mile long. This jam has been accumulating for over thirty years, the guides tell me. Here we had to portage everything to the head of the jam.

During all our passage up the trout fishing was very poor, the best being but one pound in weight. We were now recompensed for coming so far. At the head of the jam the water was only about four feet deep and clear as crystal, and in the bottom we could see the trout in swarms, some "long as a fishing pole," one guide said.

I got my rod ready and tried them with a Jock Scott, but no use. Tried nearly every colored fly imaginable, but no success; the guides in the meantime having fixed camp and rigged their rods, which were cut out of the surrounding bush, of about four feet long, with a good strong hook and a piece of pork for bait, and if they were not landing some of the finest trout I ever saw it was a caution. I then got them to cut me a rod, as here you must fish in the holes among the logs, and a long, light trout rod is useless. So, being rigged, I commenced, and it would take us all of ten minutes to land them. We caught sixteen dozen, averaging 2½ lbs. each, and then stayed the slaughter as I was afraid we would not manage to keep them from spoiling, having insufficient salt with us; but the guides fixed them, part sun dried and part salted. Next morning the sky had changed, wind westerly and continual clouds. Tried the fly with success, but as the canoe could not be used on account of its shadow in the water I had to wade, and that in some places to the arm-pits, but had the pleasure of landing in three hours four dozen, some of them five pounds weight.

Having exhausted my vacation I thought it time to take the home route again, although it was my intention to go as far as Eagle Lake, but home I must go, and having the fish well packed in cedar branches we commenced our journey back.

While going down the river ahead of the guides, about one-half a mile wading and fishing, and not taking particular notice of my surrounding I nearly fell over a full-grown bear. I was walking across a strip of sand where the river took a short bend, and having leather moccasins on I made no noise whatever, and Mr. Bruin was lying down in the sand by the river's edge within twenty yards of me. I don't know well which made the best time for home, the bear or I, but mine was "Dexter-ously" fast, and when I told the guides they immediately got the rifle (I carried no revolver) and started in pursuit, but Bruin had a good start and was not to be bagged that time. On examining the shore along could be seen footprints of both a large and a small one. One track I followed for fully one-half mile along the river in the sand, of evidently a she bear and her cubs by the large and small foot-prints. We never had any close aquaintance with them after that, but the same night a hunter shot one about a mile from our camp, and the skin measured ten feet.

Nothing of note happening on our journey except the bagging of an occasional hare, and we arrived at the colonel's who gave us a hearty welcome and a good send-off.

Arrived at Fraserville the boys turned out to see the "catch," and they were surprised to learn that I had upward of a flour barrel full, and after sending around a few dozen among them I had a jolly fine supper from mine host, Alex. Gilles, who invited all the boys, and they toasted me to my heart's content.

Home again and sorry for it, but if the readers of FOREST AND STREAM wish good fishing I can recommend Madawaska River. SIMON FRASER.

Quebec, Sept. 15.

SUCKERS.

THE question of a correspondent of FOREST AND STREAM of Feb. 24 in reference to sucker fishing and replied to in your answers to correspondents, reminds me of much sport I have had catching suckers with a three-pointed hook. On most any railroad or wagon bridge where suckers most do congregate, especially in the West, one can look down when the water is clear and see the sucker or redhorse nosing along among the rocks, slowly working up stream. If the conditions are favorable one can see a fish stop at a stone or against a rock of a pier, for instance, and take in the moss and vegetable substance adhering and then throw it out in puffs or little clouds when he has extracted the nutriment he was after.

I have had my sport with an ordinary bass line and reel with a grab-hook attached, and a bullet or bullets to keep it steady and guide it to the fish's nose. If not alarmed or on the *qui vive* against danger the sucker is rather stupid, you know, and not much account anyhow. It requires care and patience to direct the hook at the end of twenty or thirty feet of line, but it can be done, and there is lots of fun in it—when you have nothing else to do. Throw the hook in a few feet up stream, guide it skillfully down to the unsuspecting redhorse, and just as it reaches the bottom under *Moxostoma's* nose, jerk! To use an expressive phrase, if the hook takes hold he'll do some of the liveliest thrashing about you ever saw in your life, and it will tax you somewhat to get your game to land. I have several times furnished the greatest amusement to my children by taking them with me and spending an hour or so catching suckers. We had a colored attendant who was always glad to take our fish, knowing that we cared nothing for them. He had a way of dressing them and getting rid of a half million or so of bones that was novel. He would partially sever a sucker's head, make incisions each side the backbone, and then, by a "twist of the wrist," yank the head backward and pull the backbone out with a large proportion of all the numerous small bones adhering!

J. A. B.

WHERE AND WHEN DO BLUEFISH SPAWN?—Red Bank, N. J.—Under the above heading I wish to add my local experience for the last fifteen years. The bluefish arrive in our river about June 1 but I have taken them as early as May 25. No earlier. They do not remain down the river but a very short, time but take the flood and go up to Lawrence's Cove, nearly opposite Red Bank, this being about as far as they and the weakfish go up this river, the North Shrewsbury. I am under the impression that at this cove (Lawrence's) they do their spawning, as they remain here about two weeks when they leave for the lower part of the river in the vicinity of Locust Point. About the 15th of July small schools of young bluefish are seen in Red Bank Bay and up by the railroad bridges. They are about one inch in length and are taken in the small seines in company with menhaden fry, but are smaller at this date.

About August 15 or 20 the same "young snappers," as we call them, become a nuisance to the bait fisherman. They remain with us all the season and are about the last to leave. The large fish, when they first enter the river weigh about one and a half pounds, with an occasional one about three-quarters of a pound. I have visited the beachfrom May 25, to October 15 during the runs of the large fish and I have never seen on the beach a smaller bluefish than four inches in length. So I presume from this they cannot claim the sea as their birth-place.

The young of this species of fish are of a very rapid growth. I have frequently taken them, while trolling for striped bass, four inches in length and this on a four-inch squid. Happy to hear the striped bass we sent to California were a success, and when they get plentiful I will go and help Commissioner Throckmorton to "catch 'em." Should this meet the eyes of that enthusiastic commissioner allow me to send him J. A. Throckmorton's and T. A. Throckmorton's best wishes.—G. H. WILD.

ON THE KISSIMMEE—Key West, Fla., Feb. 26.—We have just completed a successful trip from the head waters of the Kissimmee River to the Gulf Coast via Lake Okeechobee and Caloosahatchie River. We used a twenty-foot boat, and made the entire trip without a portage. Our time from Okeechobee to open water in the Caloosahatchie was about two days, with little or no wind and a moderate stage of water. So far as we can learn we are the first sporting party to make the trip without a portage.—GEO. O. ALLEN.

SMELTS IN FRESH WATER—Under the heading of "Cultivated Smelts" the Boston *Herald* has the following: "One of the curious articles in our fish market last week were some cultivated smelts from a fresh-water pond in Maine. They were much large than any smelts ever before seen in our market, most of them weighing three-quarters of a pound each; 18 of them weighing 10 pounds. They were very handsome fish and very suggestive to the fish commissioners, showing what may be done in fresh water with a salt-water fish, being quite equal to what is done in Europe, and proposed to be done here with the carp. The smelts were found to be in spawn, and, in one of them at least, was found a small smelt entire."

Our correspondent, Mr. G. H. Peters, of the Grand Trunk Railway of Canada, writes us on the subject of these same fish as follows: "The smelts were caught through the ice while fishing for pickerel, and sent me by a friend to dispose of. I personally caught several last winter of equal size from same locality. 'Landlocked' would appear to be more descriptive than *cultivated*, as I am not aware that any care has ever been taken of the fish in question."

THE WA WA YANDA FISHING CLUB.—At a meeting of this club, held at Gabe Case's, Jerome avenue, on Monday last, the following gentlemen were elected officers for the ensuing year: Shepherd F. Knapp, President; James A. Flack and Charles Banks, Vice-Presidents; William C. Conner, Treasurer, and Robert A Van Wack, Secretary. After the election there was a dinner followed by speeches, songs and chat. The headquarters of the club is at Fire Island, where there is a handsome club house. The club has over 700 members.

Fish Culture.

DEEP SEA FISHING.

IN the opinion of Prof. A. E. Verrill, of Yale College, the recent deep sea dredging expedition off the coast of Rhode Island, on the edge of the Gulf Stream, under the auspices of the United States Fish Commission, proved the most successful ever sent out by this or any other country. In three days more specimens were obtained than by any other expedition in as many months. Indeed, the English expedition on the Challenger, which was at work deep-sea dredging for five years continuously, did not accomplish more or get a larger collection.

The dredging was done from 75 to 115 miles south of Newport, in the region known on the charts as Block Island soundings, the depth of the water being from one-quarter to three-quarters of a mile. The specially constructed steamer Fish Hawk, fitted up with the most approved scientific appliances, was used, and the expedition was under the direct charge of Prof. Baird, of Washington. The ground was especially favorable. A peculiar beam trawl was used for scraping the bottom of the ocean. It was a net forty or fifty feet long. The mouth of it was spread open by an oak beam fifteen feet long and six inches in diameter. The beam rested upon heavy iron runners, to keep the network bag about two feet off of the bottom. The lower side of the mouth of the net was formed of a receding rope, weighted with lead. This rope dragged along the bottom and scraped the shell fish, shells and what not into the net. Fish swimming at that depth were also scooped in, and once inside they were entangled in pockets that prevented their escaping. This trawl would be thrown out and drawn along behind the steamer, making a swath half a mile long and twelve or fifteen feet wide. Then a powerful hoisting engine would be set to work and the trawl and its contents hoisted aboard the steamer. As many as 4,000 pounds weight of stuff would be taken from the bottom of the ocean each time the trawl was hoisted. Two barrels of alcohol a day was used in preserving rare specimens. To put them in shape will be the work of weeks. To thoroughly arrange and classify the thousands of specimens obtained will occupy the Commission all winter. Most of this work will be done by Prof. Verrill and his assistants.

Eighteen species of fish were caught heretofore unknown and undescribed, besides others known to Greenland and Northern Europe, but not to our coast; also a wonderful variety of crabs, shrimp and lobster-like creatures, some of them very handsome, and forty species of them entirely new. One hundred and fifty-five different kinds of shells, 115 of them not before known on this part of the coast, fifty-five not known as inhabitants of American waters, and thirty wholly unknown to scientists heretofore, were obtained. In addition, two new kinds of devil fish, one about a foot long; 200 specimens of a new and pretty squid, and twenty new kinds of starfish were taken. Of these starfish, thousands of specimens were netted, some of exceeding beauty. Quite a number of new species of corals were caught, some of them being brought up by the bushel. Of fan coral some beautiful specimens were obtained. Hundreds of sea anemones, brilliantly colored, some of them measuring a foot across, delighted the eyes of men of science. One strange discovery was a worm inhabiting a quill like a goose-quill. The quills were about a foot long, and soon after being taken out of the water grew so hard that they could be and were used for pens. They stood up in the mud at the bottom of the sea. The worms inside were opal-colored, and when taken out of their strange tenements glistened and presented a rather pretty appearance, so far as color was concerned. They were raked up by thousands, and none of the scientific men ever heard of them before.

The discovery was made that the tilefish is plentier than the cod. A Gloucester fisherman last winter hauled in the first tilefish. Since then few have been caught. Prof. Verrill, however, caught three with a perpendicular line. On opening their stomachs he found therein some of the rare crustacea that abounded thereabout, and he knew it was their feeding ground. He is satisfied that they are plentier there in season than codfish off Block Island. One of the three fish caught weighed fifty pounds. The tilefish, as described by Prof. Verrill, is a magnificent fish of a light yellow-brown color, shaped like a sea bass, and spotted all over with yellow. It is fine eating, and he is convinced that it is destined to become a favorite market fish, now that it is known where it can be readily caught.

All of the fish caught by the dredges have gone to the headquarters of the Commission in Washington. The other specimens came here in many boxes a few days ago, and the work of arranging them is now being pushed forward. As many as 100 series of the various specimens will be made up and distributed among the museums of the country, the first choice going to the National museum at Washington, the second to the Peabody museum here, the third to the museum at Cambridge, and so on. A complete and detailed report will also be made by the commission.

The records of the temperature at different depths were always made with great care. At a depth of from 100 to 142½ fathoms the temperature was usually from 51 deg. to 53 deg. Fahrenheit. From 142½ to 325 fathoms it was from 42 deg. to 43 deg., and at 500 fathoms it was 40 deg. The pressure at 500 fathoms or over was very great—sufficient to crush and press together the wood

that encased the thermometer until it was a shapeless mass, and to so press the rope used to lower the instrument that it came up hardened and squeezed together until it resembled a bar of metal.

In the nine years the Fish Commission has been established, it has dredged in 2,000 localities (both shallow an l deep waters), between Long Island Sound and Halifax, and out as far as 200 miles; but never before did they have such good luck as last month on the Fish Hawk.—*New York Sun.*

DO "QUINNAT" SALMON DIE AFTER SPAWNING?

CHARLESTOWN, Feb., 26, 1881.

Editor Forest and Stream:

I took much pleasure in reading in FOREST AND STREAM of February 3, Mr. Dunn's communication in regard to the question whether the California salmon (*Salmo quinnat*, or *Oncorhynchus chouicha*) as I believe we must call it now,) dies after spawning, and I was glad to see the letter because it opens up a subject concerning which I have been desirous for some time of presenting some testimony, which I took considerable pains to collect. It relates to the California salmon that go up the McCloud River in the summer to spawn. In publishing this testimony, I wish to remind your readers that it is given by Indians who, with their ancestors, have watched the salmon of the river in question from time immemorial, and by the white men who have lived the longest on the river, and also to call your readers' attention to the fact that their testimony is given in a decided, unhesitating and unequivocal manner.

I submit to your readers whether the witnesses are not the ones who know most about this subject, and also the only ones who know about it positively and at first hand. What can San Francisco gentlemen, like my respected friend Mr. Dunn, be expected to know personally about the habits of fish in a river that they never saw or never visited more than once or twice in their lives? and what is the weight of their testimony compared with that of those who have lived on the spot all, or a large portion of, their lives?

With these preliminary remarks I will bring forward my witnesses, merely adding that their testimony was given without any leading question on my part or anything to indicate to them in advance what was wanted of their information. The question I put to them was simply this: "What do you suppose becomes of the salmon that go up the McCloud River in the summer to spawn?"

"Their answers were as follows:

Testimony of Myron Green: Mr. Green has been the head fisherman at the United States Fishery for eight years, and has lived nearly the whole of that time on or near the river. He has been very observant of the habits and movements of the salmon, and understands them thoroughly. He has a genius for catching fish and for learning their ways.

Mr. Green answered: "*I am certain* that all the salmon die that go up the river in the summer to spawn. There is no doubt about it. They cannot possibly get back to the sea in the condition they are in after they have spawned. So far from getting back to the ocean, I do not believe they could live a single day in the intervening warm water of the Main Sacramento."

Testimony of James A. Richardson: Mr. Richardson is a New England man who has held responsible positions at the United States Fishery on the McCloud for the past four years, and has also been in the employ of the State Fish Commission for several years.

Mr. Richardson answered: "There is no doubt that the summer spawning salmon all die. None are seen going back alive, while immense numbers of dead and dying salmon are seen in the river and on the banks.

Testimony of Mr. Augustus Lezchnisky: Mr. Lezchnisky has spent seasons on the McCloud fishing for salmon with a seine and working at the United States Fishery.

Mr. Augustus Lezchnisky answered that "he had no doubt that nine'y-nine per cent, of the spawning salmon died. He admitted that one in a hundred might get away alive."

Mr. Jacob Lezchnisky, his son, who has always accompanied his father while salmon fishing on the McCloud, confirmed his father's opinion.

Testimony of Mr. Henry Hirz: Mr. Hirz lives on the bank of the McCloud and has worked at the United States Fishery for several years.

Mr. Hirz answered: "My opinion is that all the salmon die after spawning."

Testimony of J. B. Campbell: Mr. Campbell is an intelligent and very observing man and the oldest permanent resident of the McCloud River.

Mr. Campbell answered:

"I have been on the Little Sacramento and the McCloud Rivers for twenty-three years, and have done a great deal of hunting and fishing, and watched the salmon on their spawning grounds. I think that all the salmon die that come to the McCloud River to spawn. They come so far from salt water, and the water where they spawn is so cold, that when they get through spawning and start to go down through the warm water of the main river they are so much exhausted and covered with fungus, and have so many parasites in their gills, that they must die, though I think that there are thousands of them that get back from the main Sacramento, as they spawn in warmer water, and the distance they have to go is not so far.

"I have been here since 1856, and have done a great deal of spearing, and have made fish a study, and also have been working at the U. S. Fishery for five years, and am engaged in the business of taking trout spawn, so that gives me a good chance to notice all the movements of the salmon. The reason that I think they don't return is that the distance is three hundred miles to the ocean, or more, and that is too much for them when they are so nearly exhausted and covered with fungus and their gills are full of parasites."

Testimony of Jeff Davis (Indian): Jeff Davis is one of the most intelligent of the McCloud River Indians, and has lived on and about the river all his life. Age, about thirty years. Jeff answered: "I think that all the salmon die and sink to the bottom of the river or float against the shore where the bears comes down to eat them."

Testimony of Keucherra: Keucherra is the most intelligent Indian woman on the river, and has spent her whole life on its banks. Age about thirty.

Kencherra answered: "I think that Jeff is right, and that all the salmon die. *I know they all die.*"

Testimony of the McCloud River Indians generally: Col-choo-loo-loo, an old chief and a very sagacious man, Nundalmy, Billie, Teff, Short Jim, Charley Nichols and many other intelligent Indians were asked the same question, viz.: "What becomes of the salmon that go up the McCloud in the summer to spawn?" and they all gave the same answer that Jeff Davis and Kencherra gave. *They were unanimous in saying that all the salmon died.* There was not one dissenting opinion.

Col-choo-loo-loo added jokingly "that he thought some of them went back to the sea, but they went overland."

The answers given above are the testimony of six white men, who know more about the McCloud salmon than any one else living. Indeed, more than all other living white men combined. Their testimony is unanimous and positive and unequivocal. It is supported by the unanimous and similar testimony of all the Indians who live on the McCloud River. Could anything be more conclusive? LIVINGSTON STONE.

THE PISCIVOROUS MINK.—A tragedy in one act.

Scene—The trout ponds and hatchery of Thomas Clapham, Roslyn, Long Island.

Time, one evening last week.

Dramatis Personæ—20,000 young salmon with the sac absorbed, and one mink.

Scene 1—Chorus of infantile salmon: "In numbers there is strength; behold, we are a mighty host!"

Enter mink—Air: "See, the Conquering Hero Comes."

Alarums and excursions within and exit mink singing, "*Veni, Vidi, Vici.*"

Scene 2—Time, morning—Enter Clapham—Song: "Who's been here since I've been gone?" "Ah, villain! What! All my pretty chickens at one fell swoop?" Echo.—"No, not all, only half; behold, ten thousand yet remain."

Clapham—"What, ho! without, there! Steel traps, I say!" Chorus—"Fee, fie, fo, fum."

Scene 3—Time, next morning—Enter Clapham—Chorus of salmon: "We are saved!" Clapham—"Behold, he came like a thief, but he goeth out as the ingredients of a muff. Oh, my salmon! If my foresight had equalled my hindsight this great grief would not have fallen upon us."—Curtain.

DAMAGE TO THE SALMON BREEDING RANCH.—A correspondent from the Sacramento *Bee* writing from Redding, Cal., Feb. 11, says: "The United States salmon fishery was established on the McCloud River about six years ago by Livingston Stone, Deputy United States Fish Commissioner of the Pacific coast, and upon his recommendation the buildings necessary for the prosecution of preparing the eggs for the streams of our own and other countries were put three feet higher than the highest mark indicated for high water by the Indians who lived on the McCloud long before the face of a white man was ever seen. For a few days before the 2d instant it snowed very heavily on the mountains that contribute their surplus water to the McCloud; on the 2d it rained heavily, and on the 3d at 3 o'clock A. M., the water had risen twenty-five feet above low water mark, and eleven feet higher than was ever known by the oldest Indian belonging to the McCloud River tribe of Indians. Two men were left to protect the property of the Government, who did all they could by fastening the buildings with long ropes to high banks, but the swift current, in its rapid transit to the sea, left nothing standing in its way. The breakwaters built to provide against ordinary floods afforded no protection, and the only building left standing was the one formerly used as a post office, situated much higher than the other buildings, which was only saved on account of being outside of the current and surrounded by trees. On the McCloud, a river whose banks are mostly of a nature and soil which will admit of its giving away, there were many land slides, which, in the opinion of many, contributed much to the sudden rise, but of this the writer knows nothing. Everything belonging to the United States fishery, except the wheel that furnished the water necessary for the hatchery and the boats that supported the wheel, was swept down the river. The loss to the Government is estimated at from $20,000 to $25,000. As this is one of the industries that indicates food, not only to all the States of the Union but to the civilized nations of the world, we have no doubt Congress will make the necessary appropriations to rebuild it. The trout fishery, also the property of the Government, of which Myron Green has charge, sustained slight damage, but is intact.

SMELTS FOR FRESH WATER.—Mr. N. K. Fairbank has ordered one million smelt fry from Hackensack, N. J., for Geneva Lake, Wis. The hatching will soon begin and as soon as the little fellows are able to stand the journey one of Mr. Fairbank's men will come East for them.

The Kennel.

April 1, at Columbia, Tenn.—Close of entries, National American Kennel Club's second American Field Trial Derby. Joseph H. Dew, Secretary.

April 26, 27, 28 and 29, at New York City.—Westminster Kennel Club Fifth Annual Bench Show, American Institute Building. Third avenue and Sixty-third street. Entries close April 11. Charles Lincoln, superintendent, No. 128 Fulton street, or P. O. Box 1,900, New York City.

THE BEAGLE.

[A description of what the beagle was like in the early part of this century is thus expressed in the *Sportsman's Cabinet*:]

THE beagle, however it may have undergone different distinctions in proportion to the size it has been bred or the crosses it may have been thought judicious to adopt, is now confined to the smallest kind of hunting dog passing under the general denomination of hound, and of which class are those who inherently possess the property of finding and pursuing their game by inhaling certain atmospheric particles inexplicably impregnated, which is sportingly termed scent: and this, acting upon the olfactory irritability of the dog so hunting, occasions such an exquisite sensation of pleasure that it imperatively extracts a joyful vociferation from every individual, which in the aggregate constitutes what has been from time immemorial exultingly called the exhilarating cry of the jovial pack.

Previous to the present improved state of hunting and polish of field sporting packs of beagles were frequently seen in the possession of gentlemen whose age or infirmities prevented their enjoyment of sport of a different description; but in proportion to the gradational improvements made in the different kinds of hounds, according to the different classes they were intended to pursue, the former attachment to beagles has been observed to decline. They are the smallest of the hound race used in this country, are exquisite in their scent of the hare, and indefatigably vigilant in their pursuit of her.

Though wonderfully inferior in point of speed, yet equally onegetic in persevering pursuit, they follow her through all her windings, unravel all her mazes, explore her labyrinths, and by the scent alone trace and retrace her footsteps to a degree of admiration that must be seen to be properly understood, during all which the soft and melodious tone of their emulous vociferation seems to be the most predominant inducement to the well-known ecstatic pleasures of the chase.

This slow kind of hunting was admirably adapted to the aged and the feminine gender. It could be enjoyed by ladies of the greatest timidity as well as gentlemen laboring under infirmity, to both of whom it was a consolation that if they were occasionally a little way behind there was barely a possibility of their being thrown out. A pack of this description was perfectly accommodating to the neighboring rustics; the major part of those not being possessed of horses found it a matter of no great difficulty to be well up with them on foot. The spirit of emulation seemed formerly to be who should produce the greatest degree of merit in the smallest compass, and packs were to be seen in different parts of the most diminutive description.

Among professed amateurs every effort was made to attain perfection, and these indefatigable endeavors were generally attended with success. Beagles were almost uniformly so well matched that they did not exceed ten or eleven inches in height, and so carefully selected in respect to speed that whenever they were running they might be covered with a sheet; and this alone is the predominant trait of celebrity in a pack of hounds or beagles whether great or small. These, though slow, are incredibly destructive, for if the scent lies well a hare has very little chance of escape, and this to the object of pursuit must prove a lingering as well as a certain death; for although in the early parts of the chase they can never get near enough the hare to press her, yet they are in general finally fatal, if even three or four hours in killing. In proportion to the increasing spirit of sporting and polish of the times slow hunting declined, and beagles became of less repute, it being now exceedingly uncommon to see any collection of beagles beyond two or three couple used in some counties for the greater certainty of finding with greyhounds in districts where hares from a variety of circumstances are known to be scarce or with difficulty to be found.

The numerous and diversified crosses in the different breeds of both beagles and hound according to the views, wishes and inclinations of those who keep them, have so complicated and variegated that particular part of the species that a volume might be produced in describing the various sorts and sizes, as thought best adapted to the soil and surface for which they are bred and intended to hunt, from the old, heavy, deep-tongued, dew-lapped, southern hound of Lancashire (where the huntsman, with his long pole, follows on foot) to the leggest-bred northern harriers of the present day, who kill their game in a burst of half an hour or forty minutes with a degree of rapidity but little inferior to coursing.

The breed of hounds now passing under the denomination of harriers have been brought to their present state of perfection by a repetition of crosses between the beagle and foxhound for the increase in size and promotion of speed, but beagles, in the sporting acceptation of the term, are not to be considered synonymous with harriers, to whom, although they possess precisely the same properties, they are much inferior in size. That some adequate idea may be formed of the original beagle, the following ludicrous transaction is introduced from the most indisputable authority:

The late Col. Hardy had once a collection of this diminutive tribe, amounting to ten or twelve couple, which were always carried to and from the field of glory in a large pair of panniers slung across a horse. Small as they were and insignificant as they would now seem, they could luviariably keep a hare at all her shifts to escape them, and finally worry, or rather teaze, her to death. The catastrophe attending which curious pack was of a very singular description, for a small barn, having been some time appropriated to the purpose of a kennel, was one night broken open and every hound, as well as the panniers, stolen, nor could the most diligent search ever discover the least trace of the robbers or their sporting appendage.

THE BENCH-LEGGED BEAGLE.

The following letter has been sent us for publication:

WESTWOOD KENNELS,
No. 28 WEST MONUMENT STREET.
BALTIMORE, Md., March 7.

R. C. CORNELL, Esq., Sec. W. K. C.:

Dear Sir—I have just learned, with much astonishment, that in your coming bench show you ignore, by failing to provide a class for, the bench-legged beagles, a distinct and numerous family in this State, well worthy a recognition in any first-class show and just as well established as a separate and distinct breed of dogs as the Gordon setter or the Chesapeake Bay dogs, etc. By this action you exclude quite a numerous entry and slight as pretty and useful a family of dogs as any one could be proud of. They have been bred with great care in this State for quite a quarter of a century by several gentlemen who are as careful of their crossing as any one could be with their setters. The type has been recognized at Pittsburgh and judged by Dr. Twaddell, of Philadelphia, who is possibly the best authority on the beagle in the country.

My bench-legged beagles have been selected and bred from the best of kennels, commencing with Katie, imported by Charles W. Banks, Esq., Anne Arundel Co., Md. Katie was bred to Mr. S. Lark's imported Smart by Mr. Banks, and I purchased of him Dyke and Dell, of that litter, and they are now the finest field beagles I ever followed. Dyke was second at Pittsburgh to Major, a dog I had bought and sold.

There are half a dozen or more packs of bench-legged beagles within a radius of ten miles of this city, notwithstanding the cards of interested newspaper scribblers that they never heard of such a dog, and, judging from their ignorance in the matter, I should doubt if they ever owned a pure-bred dog of any kind. I have also the English, or straight-leg beagle. Among them, two imported bitches, Lulie P. and Lula, just returned from Detroit, Mich, on a visit to Rattler.

Lulie P. was first at Pittsburgh in the best class of bitches I ever saw, but my bench-legged are very superior to any straight-legged I ever followed; therefore you should give this numerous, pure and useful little dog a class—for the following reasons:

1st. That the bench-leg beagle has been known as a pure breed for many years in Maryland and Delaware.

2d. That he was originally imported as a pure breed and that recent importations have been made of the same type, viz.: Katie and Smart, the sire and dam of Dyke.

3d. That if there were any mongrel blood such as a dachshund cross would indicate, it was in England that it was alloyed, and as dachshunds have only been introduced in England within a few years past the bench-leg, as a breed, *ante*-dates it there.

4th. That the bench-leg, as a hunting dog, is superior to the straight leg, as demonstrated by Gen. F. A. Bond, who, in a letter, some months since, stated that on one hunt his pack caught thirteen rabbits out of that number started.

I am prepared to make good what I have asserted.

The delay in writing you this, and now done in this imperfect and hasty manner, is because of the rules of my profession.

Hoping to hear from you that a class will be made for the bench-legged beagle, I am, respectfully, T. CLAY MARTIN, M. D.

NEW MARKET, Md., March 7.

Editor Forest and Stream:

I notice in the FOREST AND STREAM of March 3 a communication signed "Hare," in which the writer doubts the existence of the bench-legged beagle, and makes an attempt to stigmatize the crooked legs of the dog as a deformity. The writer claims to know all the breed throughout the State of Maryland. I claim if this gentleman has seen all the principal beagles of Maryland he has seen this type, and as he makes the assertion that there is no such type, he has not seen all the beagles of Maryland. If he will correspond with sportsmen outside of Baltimore he would find plenty of this type, especially in Montgomery and Frederick counties.

This dog is undoubtedly a pure beagle, and is entirely distinct from the Dachshund; is not the same color or shape, has not the same legs, head, ears, body, or tail, and is not a deformity by any means. Fifty years ago this dog was bred in the counties I name by Elisha Gaither, Benus Dorsey, and others, and from these gentlemen I got my dogs more than thirty years ago, and since their day they are to be found among their relations. They were also bred by Harry W. Dorsey, Dr. N. O. Shipley, H. W. D. Waters, and others of this county, and since their day the stock has been bred in its purity by their sons and relations. Having bred these dogs so long I think I am a competent judge, and ought to know a little about them. I again claim them to be absolutely pure beagles, without a taint of any other blood. I will further state that for fox-hunting purposes they are the equal of the modern beagle, and in no way his inferior except as to speed, being slower, and for this reason are preferred by some of us, as they do not kill their game as quick. I own to-day both types, and exhibited both at Pittsburg, knowing at the time that the bench-legged dog could not win, as they were to be judged by the Stonehenge standard, which was made for the straight leg, or modern beagle. I sent them by way of comparison only.

This effort to stigmatize them as a mongrel and deformity looks like a sharp dodge to prevent a class being made for them at New York, in the interest of a clique who breed straight leg dogs for market, and by doing this to drive them off the bench and out of the market, and thus prevent competition. As field dogs they are not inferior to any in the world. I shall exhibit several at the New York show in April—class or no class—by way of comparison, and there they can be examined to the satisfaction of our dog critics. I do not ask any one to take any stock in them. I do claim for them that by having less speed they make less outs than the modern type, and will also find and carry off an out quicker. Owning both types of the beagle, I know this to be the case.

Gentlemen, you must not call our dogs mongrels and deformities until you see them and are competent to criticize. The attempt you now make is highly amusing indeed. Wait a while until you are better educated in short legs and then you may be competent authority. As you now stand you are off the track. Next time come out and sign your name in full: don't play hide and seek under a *nom de plume*. POTTINGER DORSEY.

CURE FOR GUN-SHYNESS.—It is a fact that few breeders will deny that all blue blooded dogs, the Laverack setter in particular, are as a rule excessively nervous; and, unless great care is observed in training, are apt to be gun-shy or bolters. It is sorely discouraging to the sportsman after bringing a well-bred dog

through the many ills he is heir to to find such is the case, and that he has nothing but a show dog for his pains. A good plan to follow in raising a puppy is to begin firing a pistol at feeding time, commencing with very small charges and increasing the loads as the animal becomes accustomed to the noise, and immediately after the report placing the food before him—the sooner afterward the better that the noise may be associated with the pleasure derived from eating the meal. Such a plan, if persisted in, will render it impossible for the dog to ever fear a gun. I once said I should not fear to attempt to correct gun-shyness in an old dog in the same manner, and I still think it might be accomplished if the dog was kept with a keen appetite for his meals. HOMO.

AN IRISH SETTER FAMILY.—We are indebted to Mr. M. S. Baker, Bucksport, Me., for a photograph of his Irish setter bitch, Nell, and her eight puppies. The young 'uns are nicely grouped, and the picture in its way is a novelty.

JOCKEYING AT FIELD TRIALS.

FIELD TRIAL X ROADS, PA., March 5.

Editor Forest and Stream:

Since "Fritz" is denied the privilege of dating his communications at Pittsburgh, with your permission my address will be as above, Field Trial X Roads. What matters it if I do move around in the smoke and soot of Pittsburgh?

When Messrs. Henrichs, O'Neil and "A Pittsburgh Sportsman" rushed into print to "rebuke" "Fritz" I felt all used up, completely obliterated, and I thought of giving out and inquiring if there was anything left of "Fritz." Then I said to myself, well, "let the galled jade wince, our withers are unwrung."

Now, let me give attention Mr. Henrichs. Does he not virtually admit all I claim in regard to the heat between King Dash and Seiler's Dash at Lancaster? My object in citing the case was to prove that the judges were guilty of a "misapplication or a wanton disregard of the rules," and I gave facts to prove it. Mr. H. certainly was writing under some strange influence, which might have been his anxiety to prove he was not "Fritz," or it might have been an indulgence to too great an extent in that which he accuses "Fritz" of, be this as it may, he is considerably mixed, as he puts words in my mouth I did not use. He says "he quotes the heat between Seiler's Dash and King Dash as an example of the crudity of the rules, and charges the judges in the same breath with a misapplication or wanton disregard of the rules" Now, did I, Mr. H.?

Did I not say rather, that "the bad feeling" at Lancaster (which you know all about) grew out of not the crudity of the rules, but misapplication or wanton disregard of the rules." But let us see what Mr. H. says on this very subject: "I think any error was not a wanton disregard of the rules, but simply an error of judgment." He admits an error without saying definitely how it occurred. I state definitely how in my judgment it occurred. Take the facts as given in this heat, and let any man say I was not justified in using the words "misapplication" and "wanton disregard." I sincerely hope Mr. H will not be annoyed in the future by any one charging that he is "Fritz." Now we know to a certain extent who "Fritz" is not at least, and as for using "King Dash in any of my vaporings in the future," I will take care of that. I do not propose to slander "King Dash," but would remind Mr. Henrichs that King Dash in field trials becomes to a certain extent public property, and I shall exercise the right to criticise him at any time, and would advise that thin skinned people keep out of field trials with their dogs. Mr. O'Neil, the great gun-stove man, seems only exercised as to "Fritz's" whereabouts; he "has no desire to enter into the merits or demerits of the subject." What matters it where "Fritz" is so he speaks the truth? Oh! I see, he don't want it understood he is "Fritz," and he would prefer that "Fritz" would not speak the truth from Pittsburgh, but would go somewhere else.

And that "Pittsburgh Sportsman" is amusing, he don't sign his name, but he says, now, "Fritz" you are a coward, don't shoot from behind a blind, "Pittsburgh sportsmen never shoot from behind a blind." "What, never? Hardly ever."

Now, gentlemen, one and all, you misunderstand my motives. I am not vindictive, but contending for a principal of right, and if you were less cowardly you would denounce such irregularities, dog jockeying and trickery as I have named, and which has been as well known to you as to me.

I am glad to see the FOREST AND STREAM is going for the dog jockey Whitford and rebuking him for his trickery at field trials. So notorious is the man becoming that a fair-minded handler does not care to be put down with him, and we have heard a number of gentlemen say so, expressing their opinion. All say, "Watch Whitford's tricks," and advise "If you get down with him to use his own weapons," or, in other words, "fight the devil with fire."

In this connection I cannot help referring to the manner in which John Davidson was jockeyed out of his heat by Whitford at the Vincennes trials.

Near the close of the heat Davidson's dog secured a magnificent point, and Whitford was ordered up with his dog to back. He delayed a long while and created such a racket that the bird ran and flushed, very likely unseen by the judges, but distinctly seen by a number of spectators as it flew over their heads. However, Whitford got his bitch up, and went forward and caught her by the stern pressing her down, and in an undertone steadied the dog in his peculiar manner, and this was called a back and Davidson was scored a false point, and was literally jockeyed out of the heat.

Here, too, Whitford displayed his trick of circling ahead of Davidson and stealing his point, which was called "nice generalship." John knows it all.

Probably I should close here, but must refer to one other matter so well known it is becoming a matter of general remark, viz., that field trials are degenerating through the influence of certain kennel men and tricky handlers, who seek by such influences as I have named to push their dogs to the front, and then announce them in the stud at $50 or more.

Is this not the case with Gladstone? That challenge was declined because of his service, you know, and Count Noble had no sooner been awarded first than the fee was fixed at $50, and business commenced right there and then.

Now, Mr. Editor, it is this kind of work that is disgusting gentlemen sportsmen, and will be destructive of field trials if not checked, and the sportsmen of the country are coming to know it. Speak out, gentlemen; speak. FRITZ.

THE COUNT NOBLE-MAY HEAT—Coatesville, Pa., March 4.—I have been patiently waiting (entertaining a vain hope) that some one might feel interested enough in the National Field Trials Association to reply to a communication published in a late number of the FOREST AND STREAM by "Fritz," correcting untrue statements therein set forth regarding the actions and record of a certain dog; thereby relieving me of the unpleasant task, which I believe to be the duty of every true sportsman and lover of fine dogs to do, thus hoping to encourage and to improve if possible the breeding of all sporting dogs. I, therefore, briefly express my opinion as to the field qualities of the promising young dog Count Noble, which fairly won the first prize awarded him in the Derby at the late trials at Vincennes. It will be observed that two persons can witness a contest, and greatly differ in their judgment as to the merits of a dog. I was present at said trials, and was particular to note every movement made by each dog in this particular heat, and must say in justice to the judges as well as to the dog, that their decision was correct, and they could not honorably have decided otherwise. It was a great disappointment to Count Noble's many admirers that he did not get an opportunity to compete with some of the champion dogs of the day in the free-for-all class in which also he was entered with fair chances to make a brilliant record.

My opinions herein expressed are nothing more than the sentiments of almost every one present at the time. In fact I did not hear a single objection while there to the decision of the judges in this case. Therefore I do not think "Fritz" could have been there.

I venture to assert that a large majority of those present will agree with me in saying Count Noble did not make a single mistake, but made game and pointed staunchly in every instance when an opportunity was offered. His first act of winding and roading the covey such a distance, fairly locating the birds and establishing his point down wind in the manner in which it was done, would be considered a remarkable feat for any dog having the advantage of years of experience. I do not wish to be understood as faulting in any way the grand little bitch who was so unfortunate as to be drawn to run against this dog. On the contrary, I think her a good one, and, perhaps, but one of her sex in this State her superior.

Our friend seems to doubt the validity of the offer of $1,000 for this young dog, the truth of which I have never doubted. I will, however, assume the responsibility of producing a purchaser for Count Noble when required, for that sum.

By thus expressing my views, which I believe to be correct, I hope to remove a possibly made false impression on the minds of my brother sportsmen who did not have the opportunity of witnessing the race alluded to.

In conclusion, in order to convince every undecided or doubting one of the truth of my assertions, I shall only ask them to be willing to wait until after the next meeting of the National American Field Trials Association when I trust there will be none left to doubt. I hope to have the pleasure of there meeting my friend, who will by that time be ready to either acknowledge his error or produce the dog that will go front. I. YEARSLEY, JR.

NEW YORK DOG SHOW.—The Westminster Kennel Club has selected the following-named gentlemen, who have consented to act as judges among others at the show under the single-handed system: the Hon. John S. Wise, of Richmond, Va.; Major J. M. Taylor, of Lexington, Ky.; Mr. S. T. Hammond, of Springfield, Mass; and Dr. J. S. Niven, of London, Ontario. No assignment has yet been made of the different classes except in the case of Dr. Niven, who will have the judging of the fox terriers, bulldogs, bull terriers, Skye terriers, dandie dinmont terriers, Irish terriers, Yorkshire terriers, pugs, Italian greyhounds and toy spaniels. A meeting of the club is to be held on Monday next when all matters of detail will be arranged. The club has determined to offer the following special prizes for dogs that have run and been placed in any field trials in America: To the best pointer dog, to the best pointer bitch; to the best English setter bitch; to the best Irish setter dog, to the best Irish setter bitch. Gordon setters have not been included for the reason that but one of that breed complies with the conditions and there could, consequently, be no competition. The prizes will be either cups or gold medals.

A donator, whose name has not yet been made public, has offered the following special prizes: For the best English setter, native or imported, among the "very highly commended" of the show, $25; for the best pure Laverack setter dog, $25; for the best English setter dog for stud purposes, to be competed for only by winners of not less than three first prizes, records of previous get to be taken into consideration, $25; and a similar prize, under similar conditions, for Irish setters. The Cocker Club will also probably offer several special prizes in the classes they represent.

In all probability the field trial winners will be benched together on a platform in the centre of the building; and the large dogs, such as mastiffs, St. Bernards, etc., will not be penned as heretofore, but chained behind a strong railing. This will enable the public to view them all at a glance. Thirty-six spaces have been provided for the dealers in sporting goods and a grand display is anticipated. All the express companies have agreed, on prepayment of the regular rates to the show, to return exhibitor's dogs free, and the railway companies have consented to carry dogs both ways free when accompanied by their owners or care-takers.

The following is a copy of a letter which has been sent to all the editors of foreign sporting journals:

NEW YORK DOG SHOW.

New York, March 14, 1881.

SIR: By this mail I send you premium list of the New York Dog Show which will be held on the 26th, 27th, 28th and 29th of April. The entries close on the 11th of April Any exhibitors who wish to send their dogs here, and do not receive prize lists in time can enter them by stating the breed of dogs they wish to enter, and give name of dog, color, age, sex, weight and pedigree. Entries to be addressed to me, 138 Fulton street, New York, U. S. A. I am requested to ask if you will oblige the Westminster Kennel Club by giving this notice in your paper. The entry fee is two dollars. Dr. J. S. Niven, of London, Canada, will judge fox terriers, bull dogs, bull terriers, Skyes, dandies, Irish, Yorkshire, pugs, Italian greyhounds and toy spaniels. Intending exhibitors should procure, before shipping, a certificate from the Consul at Liverpool that the dogs are sent only for exhibition and breaking purposes. Yours respectfully, CHAS. LINCOLN, Supt.

EASTERN FIELD TRIALS CLUB MEETING.

A MEETING of the Eastern Field Trials Club was held in the *Tribune* building, Thursday afternoon, March 10. The following gentlemen were present: Messrs. J. Otto Donner, Dr. H. F. Atwater, Livingston Ruyvesant, R. F. N. Hall, Max Wenzel, R. C. Cornell, H. A. Hamilton, George C. Leech, E. A. Herzberg, J. Von Lengerke, W. A. Coster, H. N. Munn, J. Pentz, Dr. J. W. Green, P. H. Morris, W. H. Holmes and Dr. J. C. Monroe. The meeting was called to order at four o'clock with President Donner in the chair.

The committee appointed to investigate the charges against a member of the club reported that they had looked over the by-laws and could find nothing which related to a case where charges had been preferred by a non-member; and, therefore, were unable to act in the matter and requested to be discharged. Their report was accepted and the committee discharged

The Committee on Constitution and By-Laws, composed of Messrs R. C. Cornell, chairman, George C. Leech and F. N. Hall, reported progress. The committee appointed to revise the running rules of the club were, Messrs. Chas. H. Raymond, chairman, J. E. Granger and J. Von Lengerke; they also reported progress. Messrs. James H. Goodsell and J. L. Logan were unanimously elected members of the club. A well-known gentleman was blackballed, presumably on account of personal feeling against some of the most influential members of the club, and, thereupon, Mr. Cornell withdrew the names of several gentlemen whom he had proposed as it was apparent that the same tactics would be resorted to with regard to them. Mr. H. N. Munn resigned the position of Treasurer and Mr. F. N. Hall was nominated as candidate for the position of Acting Pro tem. Treasurer *pro tem.*, until the next meeting when one will be elected

The Committee on Charter reported that they had handed their report to the Committee on Constitution and By-Laws. The President, Mr. Donner, tendered to the club money to pay the club's indebtedness, he to be repaid out of the club's first money received by the Treasurer, Mr. Donner was tendered the thanks of the club. The chair, which was left over from the field trials, was presented by the club to Col. Bruce. The meeting soon after this adjourned. A meeting of the Executive Committee was then called and adjourned, subject to the call of the Chair.

GARFIELD'S YELLOW DOG.—The story of the eagle which settled down on General Garfield's house in Washington, the day of his nomination at Chicago, has been supplemented by the Washington *Star* with the following story of a mysterious yellow dog which appeared in the inaugural procession the other day:

That little yellow dog that was seen following the carriage containing General Garfield in the procession has a history that is worth printing, even on this day when our columns are so pressed for space. About a year ago the same dog followed General Garfield from where he got off a street car, at the corner of Thirteenth and F streets, to his house, corner of Thirteenth and I streets. The General, noticing the dog, threw him a piece of meat, and forgot the occurrence until he met the same dog on the same corner the next day. Following him home again, he was rewarded by another piece of meat. Finally, the dog made General Garfield's house a kind of temporary headquarters. When General Garfield went to Chicago as a delegate to the Convention that nominated him, the dog followed him to the depot. Before the news reached here of the nomination of General Garfield, the dog set up a joyful barking that was almost unbearable. "Something has happened," said one of the ladies in the house, "and here is a telegraph messenger." The message contained the information of the nomination. When General Garfield came here some weeks after his nomination, the story was told him, and he said he would take the dog to Ohio with him, but when the time for starting arrived the dog could not be found, the animal being of a roving nature. General Garfield never saw the dog since until yesterday, when, riding out with a friend, he saw him. Calling him by his name, "Bab," the dog recognized the voice and appeared to be happy. As the General arrived at the Riggs House the dog again disappeared. He saw nothing of him until to-day as the procession was moving from the White House. The dog followed the carriage all the way to the Capitol, but must have got mixed up or lost in some way, for he did not come back with it.

NOTES FROM ABROAD.—Personally, I don't much believe in coursing. To begin with, hares differ so much, that an unlucky, though superior dog may have the misfortune to have several severe courses, which will exhaust him, and cause him to go down before an inferior greyhound who has been lucky in his hares. Then again, I cannot see how the judge is to calculate the points made by the greyhounds so as to give satisfaction to all concerned. It is one thing to draw up a scale of points on paper, and attach a numerical value to each, but it is quite another to apportion them correctly during a course.—SENEX, *in Live Stock Journal.*

The Margate Dog Show, governed by the English Kennel Club, was held on February 23, and 24. It is now looked upon as an annual affair, and was well supported by all classes, including the talent from the north. The class of exhibits compared favorably with shows of older standing. Mr. Lort, Dr. Stables, Mr. Berrio and Mr. Hill were the judges. Leache's Bang, II. won first in pointers; Bulled's Frantic, first in English setters; Hayward's Driver, first in black and tan setters.

The Fox Terrier Club's second show was held at Oxford, on February 22. It was very successful, and Mr. Doyle's awards gave general satisfaction.

The great Scottish Metropolitan Dog Show, attracted considerable attention at Edinburgh on February 19 and 20. Over 400 hundred dogs were brought before the judges, and they embraced nearly every breed. Pointers above fifty-five pounds—First, J. Royle's Marshall Prim; under fifty-five pounds—First, C. H. Mason's Chancellor. Setters, English, first and second, J. Shorthouse's Royal, IV. and Novel. Black and tans and red Irish; first and second, M. Macdonald's Young Jack and Dash, III.

I am told that Mr. W. A. Pape, of Newcastle-on-Tyne, possesses a wonderful breed of black pointers, and is anxious to introduce to his kennel fresh blood by black dogs to prevent the strain deteriorating. I have not seen Mr. Pape's dogs, but a mutual friend gives me glowing accounts of them; and as I think the proposed plan of introducing foreign blood, if judiciously done, one of the secrets of success in breeding, I gladly draw attention to Mr. Pape's requirements. For my own part, I think the color rather objectionable, as is a whole liver color to shoot over; but when the color is decided, as in this instance, a cross with dog or bitch of dark liver, and come of a dark colored strain, would most likely throw a good proportion of blacks. If my memory serves me well, some six years ago Mr. Corbett, an Irish gentleman, exhibited several black pointers at the Exhibition Palace, Dublin.

An American person writes that he knows a collie that is *said to be twenty-eight years old.* I don't doubt it—the *said to be*, not the age, I mean. On that point I shall be very glad to hear of a dog that can be proved to have reached the age of twenty years. That story of Ulysses and his dog Argus is all *jam*—at least, so thinks SIRIUS. *in the Stock Keeper.*

THE BEAGLE PRIZES—Baltimore, Md., March 11.—If not too late to annex a condition to the special prize for bench-legged beagles you offer for the coming New York Bench Show of the W. K. C., I would like you to consider the following suggestions, viz.:

That the eligibility of competing entries be limited by purity of strain in breeding and to that end let it be made obligatory upon contestants to make affidavit to pedigree if challenged by any one interested.

I appreciate your liberality in this matter and heartily approve and indorse every word you say in favor of the "merry little beagle." I know, too, that you want to place your prizes "where they will do the most good." Don't you think, then, that to bar out mongrel or doubtful dogs is in the interest both of the beagle pure—whose champion you would be—and the sportsman true, whose friend you certainly are? MEDICUS.

We agree with much of what our correspondent says and, in theory at least, we believe with him that "mongrel or doubtful dogs" should be barred out in a competition of this kind. At the same time we are unable to see how it can practically be done—how, if a dog represents the most perfect type of his breed, a judge can go behind the evidence of his senses and complain that the animal's pedigree is not what it should be. Bench shows have to do with the outward form alone, and they are held, we take it, to determine what, so far as looks go, is the most perfect dog of each of the various breeds. The animal which takes first prize may not be worth a rap in the field, but so long as he most nearly approaches in appearance the standard of perfection in his particular strain he must take the prize, always supposing the judges to be honest and competent. In any event we should not care now, having announced the conditions for the FOREST AND STREAM trophies, to alter or add to them.

FORTHCOMING INTERNATIONAL FIELD TRIALS AT COLOGNE.—These trials will take place in the first or second week of April next, on the estates of Count Furstenberg, under the German Kennel Club Rules; but a special stake has been provided for all-aged setters and pointers belonging to, and bred by, gentlemen of all nations, provided these dogs are entered in the Germany or English Kennel Club Stud Books, and the stake shall be judged by Mr. Shirley, who will be empowered to act according to the English Kennel Club Rules and systems. As the entries close on the 25th inst., no time should be lost by those sportsmen who intend running their dogs. Mr. Lowe, 29a, Pall Mall, will receive entries. The headquarters during the trials will be at the Hotel du Nord, Cologne, and the best route for those sportsmen who will take their dogs with them would be *viâ* Harwich and Rotterdam, every attention being paid to the dogs on board the G. E. R. steamers, as we, personally, can testify. The exact dates of the trials will be duly advertised in our columns.—*Field.*

ENGLISH EXHIBITORS FOR NEW YORK SHOW.—Mr. Henry Lacy, of Hebden Bridge, and Mr. C. H. Mason, of Bradford, Yorkshire—the former, a few years ago, the most successful exhibitor of Manchester (black and tan) and other terriers in England—and the latter gentleman one of the largest and most successful exhibitors of both sporting and non-sporting dogs in England, sail from Liverpool for this country on March 19. These two gentlemen have both been manufacturers of textile fabrics on an extensive scale and their object in visiting America is the purchase of land. They both propose being present at the New York Bench Show, and it is Mr. Mason's intention to bring with him about twenty of his crack dogs of various breeds with a view of exhibiting them.

PENNSYLVANIA STATE FIELD TRIALS ASSOCIATION.—The meeting of this organization, which was noticed in our last issue to take place at Pittsburgh on March 10, was held on that date. The various amendments to the by-laws, already published in FOREST AND STREAM, were adopted, with the exception of the

one offered by Mr. Gregg, "That this Association shall have three stakes in future trials, viz., Derby, all-aged and Association stakes, and that the Derby and All-Aged shall be open to the world."

MEADOW BROOK HUNT.—The Meadow Brook Hounds will meet at the following places in March, 1881. Thursday, 17, Queens, 3:30 P. M.; Saturday, 19, New Cassel, 3:15 P. M.; Monday, 21, Westbury, 7 A. M.; Thursday, 24, Jamaica, 3:30 P. M.; Saturday, 26, Garden City 3 P. M.; Monday, 28, Kenneis, 7 A. M.; Thursday, 31, Island Trees, 3:30 P. M.

AN ANXIOUS INQUIRER.—The amusing letter printed below has been sent us by one of our advertisers. It was received by him a year or two since in reply to an advertisement inserted in our columns offering a collie for sale. The letter speaks for itself and reads as follows:

B——, N. H., May 1, 1879.

MR. F. A. T.—*Dear Sir:* I notice in FOREST AND STREAM your advertisement under the head of "Collie for sale, Bounce, two years old," etc. Now I want a dog, and a good one. Will you please answer some few inquiries?

1. What breed is he?
2. Has he been gunned over?
3. Will he stand?
4. If he has been hunted, on what game?
5. Is he fast or slow?
6. Has he been kennel broken?
7. How much does he weigh?
8. What is the price?
9. When and where can I see him?

I am not acquainted with different kennels and, therefore, am in ignorance of the breed of the dog—whether he is setter or pointer. I have had some considerable experience in gunning with dogs, and don't want any unless I can have a good one.

Yours, resp't, G—— P——.

LEONBERG DOGS.—*Editor Forest and Stream:* In a late issue of your paper I notice a letter from a gentleman referring to Leonberg dogs. I think American sportsmen ought to be made conversant with this breed (?), of which several specimens have been shown to us at our exhibitions. I state:

First.—The man who raises these dogs is neither a count nor a baron, but even to the "manor born," but a professional dog-raiser, and a poor one at that. If he, "Esig"—in English "Vinegar"—has palmed himself off as a titled nobleman he is simply lying.

Secondly.—There is no such breed in existence as Leonbergers. They are nothing but large mongrels—crosses of anything that is large. They are raised in Germany for watch dogs and as those may be good. But we, here—the same as our German sportsmen—do not want mongrels, or dogs of cross breeds, and Leonbergers are nothing but that.

A. E. GODEFFROY.

REX.—Mr. Fisher Howe, Jr.'s champion pointer Rex has recovered from his accident and is now in fine order, barring a crooked leg.

A FINE POINTER.—Any one in want of a really fine pointer dog, out of Colburn's Belle by Sensation, should address at once Mr. John S. Wise, Richmond, Va.

KENNEL NOTES.

*** Breeders and owners of dogs are invited to send memoranda of names claimed, bred, whelps, sales, etc., for insertion in this column. We make no charge for the publication of such notes; but request in each case the notice be made up in accordance with our form, that the name of both owner and dog be written legibly, or printed, and that the strain to which the animal belongs be distinctly stated.*

NAMES CLAIMED.

Lady Winsome—Mr. Isaac Yearsley, Jr., Coatesville, Pa., claims the name of Lady Winsome for setter bitch puppy out of owner's Countess (Leicester-Pocahontas) by Mr Sanborn's Count Noble (Count Wind'em-Nora.

Spring.—Mr. Wm. H. Bennett, Milford, Mass., claims the name of Spring for his dark liver pointer puppy, nine weeks old, bought of Mr. John L. Martin. (Both sire's and dam's names omitted.)

Pete—Mr. M. B. L. Bradford, Springfield, Mass., claims the name of Pete for native setter puppy out of Mr. Bloodgood's Smut by Mr. Pratt's Trim.

Little Fan—Mr. Jos. Lewis, Apollo, Pa., claims the name of Little Fan for his lemon and white pointer puppy out of owner's Nell by Fawcett's Duke.

Lilly—Mr. Jos. Lewis, Apollo, Pa., claims the name of Lilly for his lemon and white pointer puppy out of owner's Nell by Fawcett's Duke.

Busy—Mr. Jos. Lewis, Apollo, Pa., claims the name of Busy for his lemon and white pointer puppy out of owner's Nell by Fawcett's Duke.

Rushlight—Mr. Jos. Lewis, Apollo, Pa., claims the name of Rushlight for his lemon and white pointer puppy out of owner's Nell by Fawcett's Duke.

Black Bess—Mr. James Sullivan, Pittsburgh, Pa., claims the name of Black Bess for black setter bitch puppy, whelped October, 1880, out of Mr. Tyrrell's Moll by Mr. Edward Gray's black setter dog Don.

Fshion—Mr. G. W. Bassford, White Plains, N. Y., claims the name of Fashion for red Irish setter bitch, whelped July 9, 1880, out of Lincoln & Hellyar's imported Flora by Arlington.

Glengary—Mr. G. W. Bassford, White Plains, N. Y., claims the name of Glengary for red Irish puppy, whelped December 8, 1880, out of owner's Gipsey by Elcho III.

Donegal—Mr. G. W. Bassford, White Plains, N. Y., claims the name of Donegal for red Irish puppy, whelped December 3, 1880, out of owner's Gipsey by Elcho III.

Red Duke—Mr. G. W. Bassford, White Plains, N. Y., claims the name of Red Duke for red Irish puppy, whelped December 8, 1880, out of owner's Gipsey by Elcho III.

Blue Dick—Mr. G. W. Bassford, White Plains, N. Y., claims the name of Blue Dick for setter dog, whelped March 25, 1880, out of Desdemona by Chris.

Wellington—Mr. G. W. Bassford, White Plains, N. Y., claims the name of Wellington for setter dog puppy, whelped December 10, 1880, out of Desdemona by Iron Duke.

Racket—Dr. Luke Corcoran, Springfield, Mass., claims the name of Racket for dark liver and white pointer dog pup, whelped December 9, 1880, by Goodman's Rattler (Ranger–Bess) out of Goodman's Zip (Snapshot–Fanny II.)

Princess Louise—Mr. Will T. Carleton, St. John's, N. B., claims the name of Princess Louise for his cocker spaniel bitch puppy out of Junie by Flusher, purchased from Mr. M. P. McKoon, Franklin, N. Y.

Zulu—Mr. J. C. Allen, St. Johns, N. B., claims the name of Zulu for his imported field spaniel.

Jessie—Dr. David C. Frank, New York City, claims the name of Jessie for black field spaniel bitch, whelped March 12, 1880. Bred by Mr. R. M. Lindsay, Scranton Pa.

Loreno—Mr. E. J. Stark, Detroit, Mich., claims the name of Loreno for black, white and tan setter bitch puppy out of Jolly May by Druid, purchased from Mr. H. G. McMillan, Washington, Iowa.

Fleta—Mr. R. Blackwood, Montreal, Canada, claims the name of Fleta for black and tan Gordon setter bitch puppy, whelped March 16, out of owner's Young Flora by Mr. W. W. Hartwell's (Plattsburg, N. Y.) Boots.

Florita—Mr. R. Blackwood, Montreal Canada, claims the name of Florita for black and tan Gordon setter bitch puppy, whelped March 10, out of owner's Young Flora by Mr. W. W. Hartwell's (Plattsburg, N. Y.) Boots.

Daisy Dell—Mr. Richard Harvey, Phila., claims the name of Daisy Dell for his black, white and tan setter bitch puppy out of owner's Belle of the Forest by Bunnell's Rock.

Frandie—Mr. R. Blackwood, Montreal, Canada, claims the name of Frandie for black and tan Gordon setter bitch puppy, whelped March 10, out of owner's Young Flora by Mr. W. W. Hartwell's (Plattsburg, N. Y.) Boots.

Florence—Mr. R. Blackwood, Montreal, Canada, claims the name of Florence for black and tan Gordon setter bitch puppy, whelped March 10, out of owner's Young Flora by Mr. W. W. Hartwell's (Plattsburg, N. Y.) Boots.

BRED.

Eldora–Dashing Monarch—Mr. F. O. De Luze's setter bitch Eldora (Rob Roy–Blanch) to Mr. John C. Higgins' Dashing Monarch.

Kitty–Trouble—Mr. Weimer's pug bitch Kitty to Martin A. Andrews' (Boston, Mass.) imported pug dog Trouble, February 28.

Louise–Lorne—Mr. J. W. Jackson's (Opelousas, La.) liver and white pointer bitch Louise by St. Louis Kennel Club's Bow out of their Jaunty) to his pointer dog Lorne, liver and white (by St. Louis Kennel Club's Faust out of their June).

Nigger–Mark—Mr. J. W. Jackson's (Opelousas, La.) native black setter bitch Nigger out of the late Judge Lucius J. Dupre's native black setter bitch Vida by Mr. Octave Trudeau's native black setter dog Dash) to his red Irish setter dog Mark (out of Duck by Thorstein).

Zulette Charlie—Mr. H. W. Hill's cocker bitch Zulette (Romer–Juliette) to the Riverside Cocker Spaniel Kennel's stud dog imported Champion Charlie, March 3–5, 1881.

Fan–Rex—Mr. Whitehead's champion pointer Fan (Pete-Bell) to Champion Rex, March 2.

Vesper–Dick—Mr. H. J. Ferry's (Palmer, Mass.) setter bitch Vesper (Luther Adams' Drake–Diana) to Mr. Lathrop's Dick, February 28.

Blix–Rush—Mr. Bode's (Baltimore, Md.) black and white pointer bitch Blix to Mr. Orgill's Champion Rush, March 9.

Curlew–Brag—The Hornell Cocker Kennel's liver cocker bitch Curlew (Jack-Pattiecup) to Hornell Cocker Kennel's cocker dog Brag (Wildair–Buttercup).

Jennie–Tony—Mr. C. W. Church's (Colorado Springs, Col.) imported bull terrier Jennie to owner's lately imported bull terrier Tony.

Gretchen–Don—Mr. Alfred W. Bennett, Fairmount Kennel, Hyde Park, Mass., St. Bernard bitch Gretchen to same owner's Don.

WHELPS.

Lillie—Col. Chas. L. Hunt's liver and white pointer bitch Lillie (Bow–Queen) whelped on February 25 nine puppies, five dogs and four bitches, to St. Louis Kennel Club's Faust.

Nellie Horton—Mr. George E. Browne's Gordon setter bitch Nellie Horton (litter sister to Malcom to Dream II.) whelped March 4, eight puppies, five dogs and three bitches, by Mr. C. T. Bailey's Doane's Tom. Three dogs and one bitch have since died.

Young Flora—Mr. R. Blackwood's (Montreal, Canada) black and tan Gordon setter bitch Young Flora whelped March 10, 1881, four bitches out of Mr. W. W. Hartwell's (Plattsburg, N. Y.) Boots.

Nell—Mr. M. S. Buker's (Bucksport, Me.) Irish setter bitch Nell whelped November, 1880, eight puppies, six dogs and two bitches, by Mr. Everett Smith's Irish setter Dale.

Gypsy—Mr. Wm. F. Duerr's (Orange, N. J.) black and white pointer bitch Gypsy whelped February 23 five puppies, one dog and four bitches, by Sensation.

Jane—Mr. J. Neil's (Buffalo, N. Y.) red Irish setter bitch Juno whelped March 6 twelve puppies (ten living), seven dogs and three bitches, by imported Grouse, late the property of Mr. Thos. Clash, of Chicago, Ill.

SALES.

Zita—Mr. J. M. Hunter, Pittsburgh, Pa., has sold his white and orange setter bitch Zita, now in whelp to King Dash, to Mr. Charles Klocke, Pittsburgh, Pa.

Floribel—Mr. D. F. Slade, New York, has purchased from the Riverside Cocker Spaniel Kennel, Claremont, N. H., the cocker bitch puppy Floribel (Snip–Feather).

Grouse—Mr. S. A. Peck, Northumberland, Pa., has bought of Mr. John A. Smethers, Berwick, Pa., his red and white setter dog Grouse, whelped May 4, 1880, out of Dr. M. S. Moore's Floss by S. O'Moore.

Jim—Mr. C. W. Chapin, Springfield, Mass., has sold his pointer dog Jim (Trimmer–Nell) to Mr. J. Coleman Harrison, of this city.

Flusher–Junie Whelps—Mr. Will T. Carleton, St. John, N. B., has purchased of Mr. M. P. McKoon a cocker spaniel bitch puppy out of Junie by Flusher.

Frank—Mr. J. Neill, of Buffalo, N. Y., has sold to Messrs. Craigie & Radley the pure bred Laverack setter dog Frank, eighteen months old, imported by the Hon. H. B. Wright, Montreal, Canada.

Count Noser—Mr. James H. Goodsell, New York City, has sold to Dr. G. A. Stark, Milwaukee, Wis., his setter dog Count Noser out of Princess Nellie by Carlowitz.

Trim–Smut Whelps—Mr. M. B. L. Bradford, Springfield, Mass., has purchased of Mr. T. M. Aldrich a Trim–Smut whelp.

PRESENTATIONS.

Cuba—Dr. J. Marill, Poughkeepsie, N. Y., has presented to Mr. P. E. Ackert, of same place, his liver and white pointer puppy Cuba, whelped November 27, 1880, out of Lulu by Sensation II.

KENNEL MANAGEMENT.

92 S. L. A., Boston, Mass.—Please tell me what to give my setter bitch. She is active and bright, but very costive all the time. Ans.—Give more vegetable and less meat food and also give a little sulphur each morning for a week. Kennel her in a dry place and exercise when the weather is pleasant.

93 SUBSCRIBER, Poughkeepsie, N. Y.—1. I have a bitch just coming in heat and do not wish to breed her this time; should anything be done except carefully watching her? 2. How long will she remain in heat, or, rather, what is the usual period for a bitch to remain in heat? 3. Is the matter of reducing the time a bitch is in heat generally practised, and, if so, how? Ans.—1. The animal should not be exposed to damp and cold and should be carefully secluded. 2. The duration of heat is usually about three weeks. 3. No.

94 MANHATTAN.—My Gordon setter, one year old, carries his tail (which is finely feathered and uncut) curled over his rump like a Newfoundland dog. Can you suggest a way to straighten it? Ans.—It is likely to improve as the dog grows older. Operations are not generally successful.

95 F. L. C., Sherburne, N. Y.—What shall I do for my cocker spaniel dog, eighteen months old? He has been sick for a week; I gave him a dose of sulphur about ten days ago and I think he took cold from the effects of it. His eyes are inflamed, nose hot and dry; he coughs and vomits a white froth. Ans.—The dog probably has worms. Give two or three grains of calomel with from eight to ten grains of bismuth for two days, one dose a day. Follow with castor oil. Avoid giving food for twenty hours, and give areca nut twenty-six grains and several hours later repeat dose of oil. Quinine will then be of service; feed with strengthening food.

96 D. T. J., Sharon Hill, Pa.—For fleas use a strong infusion of quassia, made by suspending a couple of ounces of quassia wood chips tied in a piece of muslin in a bucket of water for two or three hours, occasionally stirring it. He free from danger, and, being almost colorless, is an advantage in washing white dogs. The infusion must be used instead of plain water with soft soap, a good lather being made to penetrate the dog's coat to the skin. Some plain water should be poured over the dog to finish the washing and remove the quassia from the coat. Care should be exercised to prevent the dog from taking cold. We would suggest, however, that you make a more careful examination of your setter as, from your description, mange may be the cause of his scratching. Should you discover such is the case, turn to issue of Feb. 24, and note treatment recommended to J. T. W.

97 C. S. L., Merrimac, Mass.—I have a cocker spaniel, twenty-five pounds in weight, that is now ailing. Symptoms are: eyes bloodshot and they run a kind of matter; loss of appetite; looseness of bowels; nose cold and moist and at times hot and dry; is alternately dull and playful, and in his sleep has a twitching. Ans.—The dog has distemper. Give two grains of quinine three times a day; good meat broths, and feed no solid food. Let the kennel be dry and warm, but give plenty of fresh air.

98 L. L. P., Highgate Springs.—See answer to W. B. G., in issue of March 10. Rub the parts afflicted. Write result after fair trial.

Rifle and Trap Shooting.

DENVER, Colorado, March 4.—The challenge issued by Captain John P. Lower, in behalf of the Tabor Sharpshooters, to the five military companies of this city to participate in a prize rifle match, was formally accepted by the Denver Fire Zouaves and Mitchell Guards, and the match took place this morning at the Olympic Garden. The conditions of the match were that the military companies were to shoot at targets placed at one-half the distance shot at by the Sharpshooters. Each team was composed of six men, and the military rifles, with open sights and not less than a six-pound pull, were used throughout. The attendance was quite fair and the interest large, and when it was known that the Denver Fire Zouaves were the winners there was considerable applause and much congratulating. The Zouaves boys are entitled to much credit for their victory, for their time of preparation was short. The scores are as follows:

TABOR SHARPSHOOTERS.

J P Lower	5	3	3	4	3	5	5	5	—41	W M Anderson	4	4	4	4	4	4	4	5	—41
J M Anderson	3	4	3	4	3	5	5	4	4—38	R C Moore	4	4	3	4	3	5	4	4	4—39
J G Anderson	3	4	4	4	4	4	4	4	—40	G W Lower	4	5	4	5	4	5	4	4	—44
Total																			213

DENVER FIRE ZOUAVES.

G Keane	4	4	3	4	4	3	3	4	4—36	J Gaggins	4	3	3	3	3	4	4	3	—34
J Dean	4	4	5	3	4	5	4	4	—41	W Hynes	4	4	4	4	4	4	5	3	4—40
Total																			230

When the match was finished Capt. Lower, in a neat speech, presented the prize rifle to Capt. C. A. Hawley, of the victorious command. It will become the property of Drummer Prosser, who made the highest score. Geo. C. Smith was the referee.

BOSTON, Mass., March 12.—There was an excellent attendance of riflemen at Walnut Hill to-day. Those who were present found but little trouble in controlling the elements, both wind and light being particularly favorable. The best scores are appended (200 yards):

RECORD MATCH (CREEDMOOR TARGET).

E Richardson	5	5	5	5	5	5	5	5	—49	J S Bennett	5	5	4	4	5	5	5	4	5—47

AMATEUR MATCH.

F J Rabbeth	4	5	5	4	4	5	5	5	—47	H Gray	5	4	5	5	5	4	5	4	5—46

NEWPORT, R. I., March 5.—The Neport Rifle Association met on their range to-day to shoot for the Ballard rifle given by W. Milton Farrow. The following scores were made:

J Witherell	4	5	5	4	4	5	4	4	—39	Wm Greer	5	4	4	4	3	3	4	4	—36
C Plummer	5	5	4	4	5	4	5	4	—45	W Sallpogh	3	4	4	0	4	5	5	3	—33
Wm Knight	4	4	5	4	5	5	3	4	—43	J Bruesch	3	0	4	3	5	4	4	4	—35
Wm Bryer	4	4	3	4	4	4	5	4	—40	S McLeod	3	3	4	5	3	4	4	3	—33

Chas. Plummer won the rifle for the second time.

MAMMOTH RIFLE GALLERY—Boston.—In the Forest and Stream match there has been considerable work done the past week by the several participants. None of them have made scores which they care to have recorded, with the exception of W. H. Harrison, who has added two 38s to his previous scores. The scores stand:

Sherburne	37	38	38	38	38—189	Harrison	37	37	38	38	39—189
Arnold	37	38				Ross					
Foggs	37					Hewlett					
Ribson	36					Goodspeed					

In the Amateur Badge match there are twenty-seven entries so far this month. The following are some of the best scores:

Pratt	34	35	35	35	—174	Wolff	27	28	29	19	29—132
Maynard	33	34	34	34	35 170	Dawson	29	29	31	33	34—156
Kelley	33	33	33	34	35—168	Bacon	27	27	29	29	33 145
Shannon	33	33	34	34	34—168	Fitz					31 34
Weymouth	33	33	33	34	34—166	Welch					31 33
Nourse	32	32	32	32	33—161	Johnson					29 33
Williams	26	33	33	33	35—160	Foster					32
Sinclair	29	31	33	33	34' 160						

The crack of the pistol this week has been almost incessant and there have been some fine scores made. Massachusetts target; 8 rounds; three scores to win, or a possible 288:

J H Williams	71	70	78	227	A P Kelley	57	39	64	—189
E Wilder	61	64	67—192	G Warren	51	55	57	—163

Expert's rifle match:

N W Arnold	36	37	38	39

ALBANY, *N. Y., March* 10.—Wind and weather seem to have no appreciable effect upon the marksmen who visit Rensselaerwyck. This afternoon was not a good one for shooting. The light was poor, the rain was falling and the targets presented a dirty appearance. The match which was on the programme at 300 yards had to be postponed as the water at the lower butt was so high that a marker could not get into it. Not to have an afternoon's shooting spoiled, the marksmen, in their dilemma, agreed to shoot a subscription match at 600 yards off hand. This was an experiment, and scarcely any of them expected to make a creditable score. However, they carefully adjusted their sights and held for all it was worth, and with one exception the scores were as good as usually made at 200 yards. When the match was completed the competitors congratulated themselves upon their success, and the result of it will probably be more matches of the same character. The following were the scores in detail:

D. Geiger, R. S.	4	5	4	5	—22	H. R. Sanders, Rep. S.	5	5	4	3	—20
Wm. E. Fitch, R. S.	4	5	3	5	—22	A. Carpenter, S. M.	3	6	3	4	—19
Theo. Mosher, Bal. S.	3	4	5	4	—20	G. H. Charles, Bal. S.	4	4	3	5	—19
James L. Miles, R. S.	3	5	4	4	—20						

One competitor failed to make an average of inners. Next Thursday, should the weather permit, the postponed subscription match and a match at 200 yards for a Wilkinson loading machine.

CONLIN'S SHOOTING GALLERY, 1222 Broadway.—The eighth week of the pistol tournament ended on the 12th inst. The competition was for the championship of shooting at three-quarter-inch bullets swinging eighteen inches, distance, seven paces. According to the conditions the competitor hitting the greatest number of bullets in twenty shots would be declared the champion. Dr. E. T. T. Marsh proved the victor, scoring sixteen bullets; H. W. Wickham scored fourteen bullets and D. D. Davis won the expert's badge

with a score of eight bullets. During the week ending on the 19th inst the shooting will be at the "ace" target. It has just been introduced by Mr. Conlin as a substitute for the playing cards which the shooters have been using as marks. The target answers all its requirements admirably and making the supply of aces equal to the demand. The tournament will be brought to a close on the 26th inst.

WHEELING, W. Va., March 5.—The Wheeling Rifle Club held their fourth and last Gold Badge match to-day at their short-range grounds. Mr. R. S. Stewart had previously won the badge on the two first competitions and Mr. B. H. Babcock on the third. The conditions were: 200 yards, off-hand; any rifle; trigger, three pounds; Mass. target; to be won three times by one competitor before becoming his property. This was the most highly-contested match the club have ever had, and shows well for their uniformly high scores. Below are the scores in full:

R S Stewart	10 12 12 10 12 12 10 10 11 11—110	Otto Jaeger	10 10 12 11 12 11 10 11 10 11—108
Wm Cox	9 12 10 12 8 12 11 12 10 10—106	B H Babcock	12 11 11 10 11 10 12 10 10 8—105
John Moore	11 11 10 12 10 11 8 10 12 10—105		

DEXTER PARK, JAMAICA, L. I., March 10.—Monthly shoot of the Nassau Gun Club for the club trophy, shot for at 7 birds each—3 at 21 yards rise, 2 at 26 yards and 2 at 31 yards; ties shot off at 3 birds each, 31 yards rise:

Schleman	1 1 1 1 1 0—1 1 1 0—9	Selover	1 0 1 1 1 1 1—7 1 0—5
Doyle	1 1 0 1 1 0 1—5	Miller	1 1 1 0 0 1 1—5
Van Wicklen	1 1 1 1 0 0—5	Silva	1 0 1 1 1 1 0—5
Midway	0 1 1 0 1 1 0—4		

Same day.—Sweepstakes, 3 birds each.

Van Wicklen	1 1 1—1 1—6	Schleman	1 1 1—1 0 1—5
Selover	1 1 1—0 1—5	Midway	1 1 0—2
Miller	1 0 1—2		

Same day.—Sweepstakes, 3 birds each.

Silva	1 1 1—3	Selover	1 1 1—3
Van Wicklen	1 0 1—2	Midway	1 0 1—2

* Divided the stakes.

MEDFORD, Mass., March 9.—The mild weather of to-day, although somewhat rainy, drew some twenty rifle-shooters together at Bellevue Range, and, as will be seen, the northeast wind blowing at the time did not keep the scores so low as was expected. Below are the best shots made:

W Jacobs	4 5 4 5 4 5 5 5—46	J Winslow	4 4 4 6 5 5 5 4—45
A Whitney	4 5 4 5 5 5 4 4—45	G A Chase	5 4 4 5 5 5 4 4—44
A B Archer	5 5 5 4 5 5 4 4—46	A Babbitt	4 4 4 4 4 5 5 5—44
E Whittier	4 3 5 5 5 5 4 5—46	W Everett	5 4 4 4 4 4 5 5—44
J H Peel	5 5 4 4 5 4 5 4 5—46	A Bigelow	4 5 4 4 5 4 4 5 5—44
E H James	5 4 4 5 4 4 5 5—45	J Richardson	5 4 4 4 5 5 4 5—44

SMALL BORE EXPRESS RIFLE—PHILADELPHIA, *March* 12.—In reference to "Quirt's" article as to the desirability of a small bore Express repeating rifle I would say that I entirely agree with him. I have for some time had in use, shooting a Winchester of 1876 model, but with a .38 or .40 bore barrel, chambered for the bottle neck 75 grain shell. This would, of course, necessitate patching the Express .38 or .40 bore bullet into the neck of the larger shell, which by loading as "Quirt" does—by tube—would hold eighty-eight grains of powder behind say 180 grains of Express bullet, or about one of powder to two of lead, and giving the Express shock desired by Col. John Hills, of the Indian Army, in his article to the London *Field*, July 28, 1879, a subject of which I am ambitious. I used a D. B. muzzle-loader of eight pounds weight and .40 bore; powder, 100 grains; Express bullet, 230 grains; it has great velocity, low trajectory and little recoil. No lead is ever found in animal; it is knocked into powder by shock. A wild boar's head was reduced to a perfect pulp; has killed over fifty tigers with it, none requiring more than a second (safety) shot. He has tried other Express rifles with the result that as you increase the bore you decrease the shock, with any endurable charge of powder. With a .45 bore, 100 powder to 280 lead the effect was good, but not equal to the other; bullet dashed into twenty pieces and shock less; with .50 bore still less, bullet in six pieces, Express shock gone; a .57 bore still worse. Henry's B. L. Express of .40 bore and eighty grains powder, the best breech-loader he has seen; weight, seven and a half pounds.—NEMO.

CARVER VS. SCOTT.—There is now in progress at the Westminster Aquarium, in London, a match between Dr. Carver and Mr. Scott. The purse is said to be £600 and the men are to shoot at 1,000 balls each night, for ten evenings. From the shooting recorded for the first half of the match it is either a very close contest or a clever piece of hippodroming. At the close of the shooting on the 9th inst, the score stood, Carver, 940; Scott, 935. At the close of the next evening's shooting the score stood as the at 1,909. At the end of the third day's shooting the score was, Scott, 2,883, Carver, 2,882. With the conclusion of the fourth day's work the figures were Carver, 3,865, Scott, 3,857; and at the close of the fifth day's, or half the match, the evenly-balanced scoring showed Dr. Carver 4,834, Mr. Scott, 4,833

BEACHMONT, *Mass., March* 9.—The weekly meet of the Schutzen corps at Beachmont to-day was a success in point of numbers, but the scores made show a falling off from the usual work of the club. The score: Massachusetts target (off-hand)—J. H. Max, 100; J. H. Miller, 100; H. Schaneck, 96; C. M. Gueth (mil), 94; J. F. Davis, 89; G. Bacon, 82. Massachusetts target rest—J. H. Max, 112; C. M. Gueth, 106; H. Schaneck, 101.

DOUBLE BARREL RIFLES.—Some one made inquiries through your columns a few weeks since for a double barrel breech-loading rifle and you stated they were not made, if I remember aright. I saw in Frank Wesson's Worcester office some time since a very fine rifle—double breech loading—but extra heavy—and I think Wesson makes them or would make on order. I am not interested at all, except to accommodate inquirer with information.—C. A.

THE TRAP.

WASHINGTON GUN CLUB.—The regular monthly shoot of the Washington Gun Club took place at their new grounds at Ridgewood Park, Brooklyn, Wednesday afternoon, March 9. On account of the inclemency of the weather the club shoot was postponed, and the gentlemen present shot a number of sweepstakes, miss and go out. Following are the scores:

Evans	1 1 1 0—3	Knubel	0 —0
Dierking	1 1 1 0—3	Watts	1 1 1 1 1—5
Evans	1	Van Sise	0
Dierking	0	Watts	1

Evans and Watts divided.

Evans	1 0 1 0—2	Watts	0 —0
Dierking	1 0 1 0—2	O'Brien	0 —0
Van Sise	1 0 1 1—3		
Evans	1	Watts	0
Dierking	0	O'Brien	0
Van Sise	0		

The club grounds are easy of access, and have been fitted up with a fine club house with every convenience for the benefit of the shooters.

BROOKLYN, March 10.—The sixth monthly shooting contest of the Audubon Gun Club, of Brooklyn, took place at the club grounds, Ridgewood, L. I. The weather being very disagreeable, the shooting was not as good as it should have been. The club shot at ten balls each, sprung from a Card's rotary trap, 18 yards rise, club rules to govern; ties shot off at three balls each, 21 yards rise:

Blackwell	1 0 1 1 0 1 0 1 0—6	Eger	0 0 0 1 1 0 0 1 0 1—4
Field	1 1 0 1 1 0 1 1 0 1—7	Allen	0 0 1 1 0 1 0 1 0 0—4
Twing	0 0 1 1 1 0 0 1 0 1—5	Post	0 0 0 1 1 0 1 0 1 0—4
Heming	0 0 1 1 1 0 1 1 1 1—7		
Field	0 0 1—1	Heming	1 1 1—3

This makes the second time that Mr. James Heming and Mr. Robt. T. Sabin have won the first medal, and we expect to have a very exciting time at our next monthly shoot.—F.

THE TRAP IN MICHIGAN.—Detroit, March 12.—The first shoot of the Michigan State Medal Association, under the new-old-anti-handicapping rules, occurred on Wednesday of this week at the usual place, Hamtramck Park Grounds; plunge traps, 26 yards rise, and 11 birds cover the case in respect to method. The holder of the medal since the last preceding shoot was C. A. Mack, agent in Detroit of the Empire Line, and an amateur sportsman whose enthusiasm at the trap and in the field is proverbial hereabout; but for some unaccountable reason he failed to put in an appearance to defend his possession of the medal. There were a good many spectators present. The day was warm and spring-like, and the "boys" seemed to feel the revivifying influence of the genial sun, the soft pellucid sky and the peppy twittering of birds. (This is a fact as well as a sentiment.) The arrangements were perfect, and when the count of noses was made the entries were found to be J. V. D. Eldredge, R. H. Gilman, Golf Stanton, Frank Mack, Aubin, Sykes, F. Metzger, Wm. H. Chudleigh and E. S. Barbour. The shooting as a rule was very weak, the only up-and-up work got in being that of old reliable Gilman who killed to (missing the sixth by a hair), and pocketed the medal for about the seventeenth time, more or less, since the contest for it began. The following is the score:

Gilman	1 1 1 1 1 1 1 1 1—10	Metzger	0 1 0 0 0 0 0 w
Eldredge	0 1 0 1 1 1 0 w	Chudleigh	1 0 1 0 1 1 1 1 w
Stenton	1 1 1 1 0 1 0 1 0 1 w	Barbour	0 1 0 1 1 1 1 1 w
St. Aubin	1 1 0 0 0 0 w		

Was worse shooting ever heard of, by men of skill and large experience, as shown in these scores? I will back the above score against all comers as the champion worst. Following the regular shoot was a sweep for a small purse in two parts; 3 birds, 26 yards rise. The score is as follows:

Gilman	1 1 0—2	Stenton	1 1 0—2
Philip Neff	1 0 1—2	Barbour	0 1 0—1
St. Aubin	0 0—1	Slocum	0 1 1—2
Eldredge	0 1 1—2		

The ties were shot off, miss and go out, when Stenton killed all of his three, taking first money; Gilman killed 2, Neff 2, St. Aubin none; Eldredge 2 and Slocum none. Barbour and St. Aubin divided second money without another trial.

I forgot to mention last week that the association had adopted an anti-profanity resolution. John Demass kept score last Wednesday on that particular racket, and he now boots up Ed. Gilman's fines for one day's objurgations at $100, which were collected and will go into the contingent fund of the association. PASSE PARTOUT.

BERGEN POINT, N. J.—The weekly meeting of the New York Gun Club was held at their grounds at Bergen Point, Saturday, March 12. The day was particularly disagreeable, yet the shooters engaged in the sport did not let them with great vim and all shot well, with the rain and sleet driving in their faces as they stood at the score. The birds were excellent, both in strength and flight, and many of them managed to get to the fence, out of bounds, before they dropped dead, much to the chagrin of the shooter, who was consequently credited with a dead bird. The shooting was under the amended Hurlingham rules, 5 birds each, 29 yards rise, 80 yards boundary; ties, miss and out. Following is the score:

F C Arnold	1 1 0 1—1 1 1—7	W M Edmunds	1 0 1 1 1—1 1 0—6

Same Day—Match at 5 birds, conditions as above:

W. M. Edmunds	1 1 1 1 0—1—5	F C Arnold	0 1 1 1 1—0—4

Same day—Optional sweepstakes at 5 birds each, handicap rise; ties miss and out:

Fredericks	26 yds. 1 1 1 1 1—1 1—7	Morris	29 yds. 1 1 1 1 0—4
Weiland	1 1 1 1—1 0—6	Howard	27 1 0 1 1 0—3
Sanders	28 1 1 1 1 0—5	Arthur	25 1 0 1 0 1—3
Rebiln	28 1 1 1 1 1—0—5	Arnold	29 0 1 1 1 w
Edmunds	28 1 1 0 1 1— 4	Dunlevay	27 0 w
Benjamin	24 1 1 1 1 0— 4		

Same Day—Contest for trophy presented by Dr. Barron, to be awarded to the competitor winning it three times; shot for at 10 birds each, from 5 ground traps, handicap rise, 80 yards boundary; ties shot off at 5 birds each:

E H Benjamin	24 yards 1 1 1 1 1 1 1 1 1 1—10		
J Dunlevay	21 1 1 1 1 1 1 1 1 0 1—9		
Col Budine	30 1 1 1 1 1 1 1 1 0 0—8		
Wm Edmunds	30 0 1 1 1 1 1 1 1 1—9		
H Rebiln	28 0 1 1 1 1 1 1 1 1—9		
Col Armstrong	30 1 1 0 1 1 1 1 1 0—8		
A Dunlevay	27 1 1 1 1 0 1 0 1—6		
J C Arnold	28 1 1 1 0 1 1 1 1 0—8		
G Jenkins	26 1 1 1 1 0 1 0 1 0 1—7		
J Conway	25 0 1 1 0 1 1 1 1 1 w 7		
E W Hall	30 1 1 0 1 1 0 1 0 0 0—5		
G Morris	26 1 1 0 1 1 1 0 1 w 6		
G C Howard	27 1 0 0 0 1 1 0 0 1—5		
E M Hammond	25 1 1 1 1 1 0 0 0 w 5		
S Ashburn	26 1 1 0 1 0 1 0 0 0—4		
J Fredericks	26 1 1 1 1 0 0 w 4		
General Woods	24 1 0 0 0 1 0 0 1 0 1—4		
L Hunter	26 0 0 0 1 1 0 0 w 3		
G Robinson	21 0 1 0 1 1 0 0 0 w 3		
H P Sandrs	29 0 0 1 0 w 1		

Referee, Mr. T. J. Dolan.

BROOKLYN DRIVING PARK, Parkville, L. I., March 10.—Monthly contest of the Fountain Gun Club for the champion diamond badge and special prize, shot for at 7 birds each, handicapped rise, 80 yards boundary:

Hazard	23 yds. 1 1 1 1 0 1—6	Cherry	27 yds. 1 0 1 0 0 1—4
Wallace	1 0 1 1 0 1—5	Simons	23 1 0 0 0 1 0 1—3
Ravenhall	23 1 0 1 1 1 1 0—6	Hunter	23 0 0 0 0 0 1 0—1

Same Day—Sweepstakes, 5 birds each, 25 yards rise:

J Batty	1 1 1 1 —5	P Ravenhall	1 0 1 0 1—3
W Cherry	1 0 1 1 1—4	W Williams	1 1 1 0 0—3
W R Hunter	1 1 0 1 1—4	S B Hazard	1 0 0 0 1—2
J Simons	1 0 0 1 1—3	B Walters	0 1 1 0 0—2

Referee, Mr. Buckley.

The slim attendance was accounted for by the bad weather.

DEXTER PARK, L. I., March 9.—Regular monthly trophy shoot of the Brooklyn Gun Club. The conditions of the contest were: Handicapped rise, 100 yards boundary, shooting from H and T plunge traps. The following is the score:

A Eddy	21 yards 1 1 1 1 1 1 1 1 1 1 1 1 1 1—14		
R Barker	21 1 1 1 1 1 1 1 1 1 1 1 1 0—13		
Mr. Gilliland	21 1 1 1 1 1 1 1 1 1 0 0 1 0—11		
G Creed	21 1 1 1 0 0 1 1 1 1 0 1 0—10		
W Wilson	21 1 1 0 0 1 1 1 0 0 1 1—9		
Mr Cornell	18 0 1 1 0 0 1 1 1 1 1 1 0—9		
Mr Dilks	18 1 1 1 0 1 0 1 1 1 0 1 0—9		
Mr. Atkins	21 0 1 0 0 1 1 1 0 1 1 1 0—8		
R Robinson	21 1 1 1 0 0 0 1 1 0 1 0 1 0—8		
G Post	18 1 0 0 w		

Referee, Captain Anthony.

March 12.—Monthly contest of the Long Island Shooting Club to decide the final possession of a gun presented by the club; shot for at 7 birds each from 5 ground traps; handicapped rise, 80 yards boundary; ties shot off at 3 birds each:

Dr Wynn	27 yards 1 1 1 0 1 1 1 1 1 0 0 1 1 0 1—12		
A Eddy	28 1 0 1 1 1 1 1 1 0 1 1 0 0 0 1—11		
Dr Talbot	27 0 1 1 1 1 0 1 0 1 0 —7		
E H Madison	25 1 1 1 1 0 1 0 —6		
W Lemken	24 0 1 1 0 1 1 0 —4		
J Joeger, Jr	23 0 1 1 1 1 1 0 —4		
Capt Boulat	21 1 1 0 1 0 1 0 —4		
R Robinson	25 1 1 0 1 0 1 0 —4		
W Mills	29 0 1 0 1 0 0 1 —3		
J V Turner	23 0 1 1 0 0 1 0 —3		
G W Tait	21 0 1 1 1 0 0 0 —3		
G Lamphear	25 0 1 0 1 1 0 0 —3		
J Lamcake	26 0 0 1 1 0 0 0 —2		
B West	25 0 0 1 0 1 0 0 —2		
F Bjorberg	21 0 0 0 1 1 0 0 —2		
Dr Morton	25 0 0 0 0 —0		

Final tie.

Dr Wynn	30 yards 1 0 1—2	W Mills	29 yards 0 1 0—1

Referee, C. Gillette.

A strong northwest wind blew in gusts diagonally across the shooting ground, causing the birds to be very irregular, though always very fast in their flight, and not a few got away entirely. The wind carried some dead birds out of bounds. Nearly all scored killed were dropped dead with the first barrel without the power of flying a yard farther, excepting one or two that, not having gauged the wind, sought to fly against it and dropped before they had gone ten yards.

WELLINGTON, Mass., *March* 11.—The Raymond Sportsman's Club held their regular meet to-day on their grounds in Wellington. The day was not auspicious for the sport, the wind being strong with occasional snow and rain, which affected good sighting and made it very hard to hold on to the little blue sphericals which darted swiftly from the traps at eighteen yards' rise. The attendance was large for the day. Messrs. Sawyer and Witherell broke twenty straight, and Gore, Smith and Kirkwood nineteen each. At the conclusion of the match two teams were improvised of four men each, under Captains Sawyer and Witherell. The Witherell team was victorious by three points, as the summary indicates:

J. S. Sawyer, 20; W. Witherell, 20; E. C. Gore, 19; J. M. Smith, 19; D. Kirkwood, 18; A. W. Gore, 18; C. Ellsworth, 18; D. H. Moore, 17; J. H. Paine, 13; J. C. Smith, 10.	

TEAM MATCH.

Sargeant team—Sawyer, 10; Smith, 8; Gore, 7; Gore, 7.	Total, 32.
Witherell team—Witherell, 9; Moore, 9; Paine, 8; Kirkwood, 9.	Total, 35.

Witherell team winning by three points.

CONEY ISLAND CLUB.—At the last regular monthly meeting of the Coney Island Rod and Gun Club Mr. C. W. Wingate, who was appointed to procure a championship club badge, produced an elegantly-designed gold badge and reported that it was ready for presentation to the member who had been so successful at the last meeting. The conditions under which the badge is to be won are that the member who wins it most times at the twelve months competition is to have it as his personal property at the conclusion of the year. The chairman presented the badge to Mr. Theodore Alston, who, at the first competition, tallied seven birds straight. Mr. J. Batty presented the club with a case of stuffed birds, to be shot for on the 16th inst. A handsome gold pin was presented to the club by Mr. C. W. Wingate, to be shot for in April. Mr. Robert Fury presented a ten-dollar gold piece, to be shot for in May. The following new members were elected: Daniel W. Northrup, Wallace W. Saunders, C. J. Silver, Harry Deginese, T. Sidebotham, Harry Brown, James O'Connor, Harry Hass, J. B. Stearns, G. C. Marsters, Benjamin Baker, B. G. Thier, William Hall and George Hiskey. The Secretary reported the number of members to be 148.

VINCENTOWN, N. J., March 2.—The Coaxen Glass Ball Club, of this place, held their monthly contest for badge here to-day. Owing to a very cold day, with very high wind and a trap throwing balls from 35 to 45 yards from trap, the score was poor. Card's trap, 18 yards, 10 balls each:

F S Hilliard	7	J W Haines	4
H E Haines	6	W J Irick	3
R H Irick	3	W S Hilliard	1
T C Shreve	4	Jos Haines	3
Capt W D Haines	3		

Tie shot off at 3 balls:

W S Hilliard	0 0 0—0	F S Hilliard	1 0 0—1

SHELDRAKE.

ST. THOMAS GUN CLUB.—March 1.—Pigeon match for $25 a side, between John Robinson, of the St. Thomas Gun Club, and W. F. Dwyer, of the Clipper Club, 30 birds each, 21 yards rise, 80 yards boundary. Score:

J Robinson	24	W F Dwyer	21

The match was shot in a snowstorm—very good shooting—Robinson killing 29 out of 30, with 5 out of bounds. This makes the second match between these two gentlemen, Robinson winning each time.

DEXTER VS. POTTER—Thomasville, Ga., March 3.—Match shot at 21 yards rise, pigeons, 10 birds, single rises, round traps, between Frank Dexter, of Boston, Mass., and Dr. T. C. Potter, of Philadelphia, Pa. Score:

Potter	0 1 1 1 0 1 1 1 0—7	Dexter	1 0 1 1 1 0 1 0 1—7

Ties, 3 birds each: Potter—1 1 1—3 Dexter—0 1 0—1.

Wind blowing very hard. H.

To produce real genuine sleep and childlike repose at night, take a little Hop Bitters on retiring.

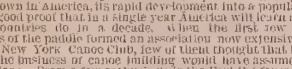
Yachting and Canoeing.

YACHTING NEWS.

SAN FRANCISCO YACHT CLUB.—*Editor Forest and Stream:* You know that over our old course we have been bothered with "calm streaks" off the Oakland shore and we have often desired a change to obviate this trouble, which interferes seriously with anything like a fair race. After a good deal of discussion our club has concluded to try the following for a change: The start to be made from Meiggs' Wharf; thence around a stakeboat stationed at a point at the intersection of a line from Hunter's Point, westerly from Goat Island, and from Fort Point northerly from Alcatraz; thence to Fort Point; thence around a similar stakeboat to Fort Point; thence in line from Meiggs' Wharf, to Alcatraz. The small boats to go only once around the course. It was also resolved that a time allowance of one minute to the foot be made, and that during the race any yacht wishing to do so may display another small ensign flag in the main rigging, the signal to be answered by whistles from the steamer. The opening day was fixed for the 9th of April. The programme for the day will be a dance at the club-house, to be followed by a moonlight sail to Mare Island. On the 14th of May the club will have a moonlight excursion and on the 27th of May the yachts will sail to Vallejo, staying there over night. On Saturday, the 28th, they will sail to Napa and on the 30th they will sail back to the city. On the 11th of June the yachts will go on a moonlight trip to Martinez and on the 1st of July the club will start to Monterey, touching at Santa Cruz on the way, the former port on the 3d. The yachts will be left at Monterey until the following Saturday, when they will sail back to this city. On the 6th of August the annual regatta will take place over the course above laid out, the race to commence at half-past 2. On the 20th of September the club will sail to Drake's Bay, returning to the city on the 4th. On the 17th of September a Corinthian regatta, at which none but members of the club will be allowed to sail the yachts, will be held. No light sails will be allowed. On the 1st of October the club will give a moonlight trip, the place of destination to be fixed hereafter. The closing day of the season will be the 5th day of November, the exercises of which will be similar to those of the opening day.—H. N. B.

THE SWEEP OF REFORM.—New York is bracing around as well. Mr. Astor's schooner Ambassadress is in David Carr's hands, at City Island, to have her centreboard ripped out and a keel spiked on, and Mr. M. B. Whitlock is making an honest little ship out of centreboard sloop Idler. She is in Driscoll's yard, at Greenpoint, receiving a keel and a new stern. Idler is a noteworthy little craft, and with a proper double headsail never come back to the sloop. They find it just as fast, perhaps a little faster, and infinitely handier and more thoroughbred in appearance. And further, while hundreds are changing from boat to boat, not any one heard of lives going back to the sloop. Facts of the day are beginning to justify the course this journal has steered exclusively and in opposition to all its esteemed contemporaries. In due time they will be singing our tunes, for which they begin to get a decided leaning already. They want to come in out of the rain and be "in at the death" of the fossil notions of the smooth-water tars, and we will not complain at their taking their cue from these columns. The more the champions of reform the merrier will things be.

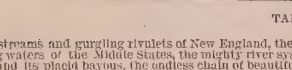
YACHT-BUILDING AT CHESTER.—*Editor Forest and Stream:* There is a good deal of activity in our yachting fleet in anticipation of the coming season. Mr. Kirk has a great many small craft under contract for renting and repairs. The beautiful yacht which he is building for the Yale College crew is now awaiting her engine and boilers, preparatory to launching. Mr. Kirk expects to receive a contract for a similar craft from Washington next month, and he is overhauling Com. Paul Klotz's cabin yacht White Wing. Other vessels of the Chester fleet are undergoing repairs and alterations. The Hamlet has been repainted; the Bella D. King has also been repainted and calked. The Emma C. has been altered in such a manner that it is thought she will give the Pyle and Vixen a hard pull during the struggle for the championship this summer.—K.



MARBLEHEAD REGATTA.—*Editor Forest and Stream:* The Neptune Association, of Marblehead, Mass., proposes to hold a regatta off Marblehead, June 17, 1881, in which all yachts and yacht clubs are invited to participate. With the exception of 1880, June 17 has been celebrated for seven or eight years last past off Marblehead with rousing regattas, generally considered by participants as the best of any held on the coast, and it is the intention of those who promoted these regattas to have one this year that will eclipse any held on former times. It is hoped that no other regatta will occur on that day near the same place and that all will join in having a good race and a good time off the old town. The Committee of Arrangements elected Luther G. Pitman as Chairman; George C. Abbott, Secretary, and Charles A. Choate, Treasurer.—X.

LYMAN'S ROWING GEAR.—When racing is not an object Lyman's bow-facing rowing gear will commend itself for family and sporting use. The gear is handsomely gotten up, strong and simple. A sample can be seen at our office. As it has not, with large sales it may be taken for granted that the rowing and sporting public appreciate it and find it consistent with their purposes.

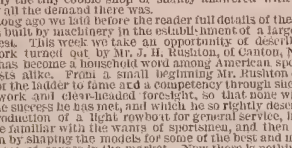
PACIFIC YACHT CLUB.—*Editor Forest and Stream:* The fixtures of our club for the year are as follows: Opening day at the club-house, Saturday, April 16; excursion to Vallejo City, Saturday, May 14; moonlight excursion and reception at the club-house, Saturday, June 11; annual regatta over the club course, Saturday, July 19; annual cruise to Santa Cruz and Monterey, Saturday, August 6.—AGGIE.



RUSHTON CANOES.

CONSIDERING the very short time the sport of canoeing has been known in America, its rapid development into a popular pastime is very good proof that in a single year American will learn as much as other countries do in a decade. When the first few straggling devotees of the paddle formed an association now extensively known as the New York Canoe Club, few of them thought that in the near future the business of canoe building would have assumed such large proportions. From a few enthusiasts in the East the fever has spread far and near, and now every town by river, lake or sea, which is wide awake, boasts of some sort of an organization instituted for the furtherance of the sport, and the ranks grow larger as more people know the delights, adventures and self-imposed hardships the little doubleenders afford. That canoeing was destined to become a most popular sport with us, the topographical features of the country must amply assure. We have thousands of miles of concealable water to every hundred to be found within the limits of other nations. The

TANDEM SAILING CANOE.



pretty streams and gurgling rivulets of New England, the creeks and rushing waters of the Middle States, the mighty river system of the South and its placid bayous, the endless chain of beautiful lakes and landlocked seas of the great Northwest, all seemed for years to sing: "O, come, canoe me!" And we have come just as fast as we have learned that "All work and no play makes Jack a dull boy." Even those most pressed by the tireless grind at life's selfish mill of gain have been taught to spare a few weeks at least each year to a wholesome recruiting of their physical systems, and have found in the use of the paddle a cheap and ready means of reaching nature in her primitive state, with whom all love to commune in the solitudes of virgin forests and rocky fastnesses, free from the sordid influences, mental cares and feverish excitement of man's hideous deliberate of brick and mortar, misery and squalor. Thus from a weakling has the pastime grown into the lusty strength of youth, conscious of its coming manhood and a field of conquest almost limitless in expansion. A glance at our pages for a few years past is the best index one can point out to show the steady strides of onward march the

AMERICAN TRAVELING CANOE.

sport has taken in popularity, until now many large firms have found it a profitable business to devote their entire attention to the wholesale manufacture of boats of all kinds propelled by paddle, where formerly the tiny cobble shop or shanty answered with its meagre supply all the demand there was.

Not long ago we laid before the reader full details of the new veneer canoes built by machinery in the establishment of a large concern in the West. This week we take an opportunity of describing in full the work turned out by Mr. J. H. Rushton, of Canton, N. Y., whose name has become a household word among American sportsmen and canoeists alike. From a small beginning Mr. Rushton climbed the steps of the ladder to fame and a competency through sheer industry, hard work and clear-headed foresight, so that none will begrudge him the success he has met, and which he so rightly deserves. From the production of a light rowboat for general service, he gradually became familiar with the wants of sportsmen, and then fulfilled his mission by shaping the models for some of the best and most serviceable types of canoes in the market. Now there is nothing known in

SNEAK BOAT.

the way of small boats he is not prepared to turn out in any number at a moment's notice. His work speaks for itself and is his recommendation wherever seen, and his boats are to be found in Maine, in Jersey, in the West, in California, in Texas, Mexico, the West Indies, South America, and even in Europe, and from all these parts we receive nothing but the highest praise of their conscientious build and stylish finish. "I would not turn out slop-work even if it paid," says Mr. Rushton, and this is one of the keynotes of his success, and of the confidence we feel in commending his craft through our columns to all the world over. Who will not recognize one of our cuts as a boat of popular approval among the sporting fraternity, as one of which hundreds have been scattered to all corners of the country to do hard duty on many a rough hunting expedition, and yet to come out of the trying ordeal without the least of a "careworn" look about her, and to be refurbished "as good as new" with nothing more than a brush full of varnish? These boats are generally 12 ft. long and weigh only 40 lbs., though larger ones of 14 and 16 ft. are built for family purposes and use in open water. As Mr. Rushton "has been

SPORTSMAN'S BOAT.

there himself," "soul carting" through the wilderness of the Adirondacks, he knows that every pound additional counts like the first five or ten, and has brought the weight of his sporting boats down to a minimum consistent with strength and toughness. The progress made stands out in strong relief when we recollect for a moment the heavy, leaky and soggy dug-outs, or the rickety makeshifts in the way of extemporized bark canoes older sportsmen will recollect as the common means of water conveyance in the hills. In the sporting boats Mr. Rushton uses oak for keel and stem, red elm for ribs, spruce or ash for gunwales, pine or ash for decking, basswood or ash for seats, and white cedar for siding. Cedar gains but little by soaking; will shrink or swell less than other woods, and although dry, light boat at all times. By a strict selection of his materials, and the use of much clinch fastening, as well as a plan of building thoroughly original, Mr. Rushton turns out a boat which has few equals in America—certainly none in Europe—and which all will readily concede is excellently adapted to the purposes in view. They are models of beauty, trim perfectly, and will go through hardship without damage, when other boats not so conscientiously put together would twist, leak and break up. The keel is 1x1¼ inches, rabbeted for the siding and the stems, which are bent to shape and protected by copper. The siding is one-quarter of an inch, six to ten streaks to the side, the edges beveled at the laps to fit. The ribs are half oval in shape, made so by being turned round and split by machinery, and are one-half to three-quarter inch wide, and one-quarter to three-eighths thick, spaced only 1¾ in. apart. Of these boats Rushton has turned out no less than fifty for stock, ranging all the way from 20 ft. long, with 40-in. beam and 13 in. depth, down to 11 ft. long with 30 in. beam and 9 in. deep, the latter models weighing 18 lbs. and the smallest size only 30. They are of varying finish to meet the wants and tastes of all. The first quality has black walnut trimmings, are copper fastened throughout, and furnished with nickel-plated fittings. The second set are also copper fastened and have brass fittings, while the third set, which 100 boats are built, is fastened for copper. The length of oars on all boats less than 16 ft. beam are 7 ft.; over that, 7½ ft. If over 40 they are 8 ft., and for 42 or more 8½ ft.

So much for the boats for general service. When it comes to describing in detail the specialties and the novelties in model which Mr. Rushton supplies, we are met with a perfect wilderness of craft, each built to meet the well-defined needs of different territory and varying service. There is the "Nessmuk," the "Shadow Sailing," the "Sneak Box," the flat-bottom "duck boat," cruising canoes, single and double, the American traveling canoe (a very handsome and speedy-looking boat), open canoes, and a host of intermediate models from which to select. Of the "Nessmuk," its idea, the champion of featherweights, her owner has written in our columns as follows:

"You ask what of the little canoe? and say you think she is too small. I don't know; she was large enough to carry me (110) and forty pounds of duffle on all the Fulton lakes, on the Moose, on Nine Mountain Lake, on Raquette, Eagle—anywhere I wanted to go. Too small for handling a very large salmon, or an open contest with a deer on the lakes perhaps. And not as comfortable as a larger, broader boat. But for a cedar boat of 18 pounds or less, she was and is a marvel of steadiness; and she is light and stanch yet, after being paddled over 550 miles on lakes, rivers, outlets, inlets, creeks, etc., and jumping her over rocks in the rapids that might have wrecked a heavier craft.

She is 10 ft. long, 27 in. wide on top, 26 on the bottom, 18 in deep at ends, 8¼ amidships, and cost only $30. That is certainly bringing both boat and price down to the very finest, and is not likely to be surpassed. Of the sneak boxes, well known to the duck hunters of the Jersey coast, Mr. Rushton has this to say:

"Mr. N. H. Bishop's Centennial Republic, from which I was kindly permitted to take the model, weighed about 200 pounds, yet owing to its sponson-shelf below the lumber is able to drag it over marsh or beach, and to use it among ice where a light canoe would soon be ruined. By thatching the deck with grass or bushes it is used for a blind (and for that reason sometimes called a sneak box), and as such can be used on the shore, among the reeds and rushes, or anchored on the water equally well. At the end of the day's hunt the sportsman can gather in his game and decoys, hoist his sail and idle away across bay or lake to hotel or home; or if it be too rough for sailing draw hatch and apron close around him and paddle a spruce breeze of his own. In which case it is said she can live in any sea as long as oars can be pulled.

While keeping the model and material intact, I have made such little changes in the make up as experience in making light boats suggested would be best. The most important of which is lighter timbers and twice as many of them, enabling me to use a trifle lighter planking and decks. The former I have thought best to 'ship lap' instead of jointing and calking."

It was in this case that Mr. N. H. Bishop, Lake George, N. Y., Secretary of the American Canoe Association, made his memorable voyage of 2,000 miles down the Ohio, the Mississippi, and among the coral reefs and oyster beds of the Gulf coasts, and whose exploits have been recorded in his book entitled "Four Months in a Sneak Box."

These little "Devil's Coffins" possess qualities of a commendable sort, and are a kind of cross between the genuine canoe and a small decked sailing boat. They are in high favor with many who have experimented with them of late, and given prominence to their best points. They are 12 ft. long, 4 ft. wide a little forward of the beam, 34 inches at the stern, which is square after the yacht fashion, the depth amidships being 16 in. Timber of white cedar, sawed ⅝x1½ and spaced 6½ inches apart; skag at stern of oak and two side keels on bottom for chafe, ⅞x⅞ in., 6 in. between. Plank is of cedar, ⅜ in. thick, nine streaks to the side, put on with a regular clinker or ship lap, and calked with ⅛ cotton. The deck is 18 in. and is 28x72 in., with a combing of red elm, and can be covered with a hatch in three lengths. Copper fastened and weight complete, 175 pounds.

The flat-bottom duck boats are 14 ft. long, 28 in. wide on bottom, with 11 in. depth amidships and 15 at ends. Sharp ends; stems and knees of natural crook oak; oak and spruce, siding ⅝ cedar, 8 streaks a side. Bottom plank ⅝ in. cedar of matched stuff. They are well liked, but we believe built only to order.

The lack of the definition of what constitutes a canoe is already beginning to be appreciated, and builders are cutting their molds accordingly. The Canoe Association adopted the following last August at the Lake George meet: "A canoe, in order to be placed on the association list and to be entered for races, must be a boat sharp at both ends and not more than 36 inches wide on deck. She may be propelled by sails or paddle, or both, but she must be capable of being efficiently propelled by a double-bladed paddle." In accord with this, Mr. Rushton and others have begun to classify their boats, and something like order has been brought out of chaos. Of cruising canoes he has worked up a fine lot during winter, varying from 14 ft. long, 28 in. beam and 12 in. deep up to 16 ft. with 30 in. beam and 12 in. deep, the sheer varying from a dead straight to 5 inches, and the crown of the deck from 3½ to 4 in., the larger ones being for a tandem or pair. Some details of these specialties will be of interest We quote from the N. Y. *Times* of last August concerning the performance of the American Traveling Canoe:

SINGLE AND DOUBLE PADDLES.

"The peculiar pattern of 'Rob Roy' canoe built by J. H. Rushton, of Canton, N. Y., and christened by him the 'American Traveling Canoe,' was universally recognized as being the most beautiful and serviceable boat of the kind to be found either in this country or in England. As a paddling canoe, to be used chiefly in shallow and narrow rivers, it is without an equal. Moreover, unlike the English 'Rob Roy,' it is an excellent sea boat, and will live in any sea where a Shoalwater can live, if it is paddled by strong and skilful arms. The builder has certainly succeeded in building the strongest, lightest, most graceful and most useful paddling canoe that has yet been devised."

Mr. Lucien Wulsin, of the Cincinnati C. C., put in a good word for the same boat while discussing the question of time allowance at the meeting of the association:

"We ask no time allowance for the American Traveling Canoes. By continued experimenting we have brought them to the point where they will sail with anything afloat."

This is saying a good deal certainly, for a fast paddler with little sheer, but as Mr. Wulsin has the experience on his side we do not question his statement. One thing no one will doubt after a glance at our cut that the A. T. C. is one of the handsomest ever put afloat. She is well suited for general inland navigation, and is a long improvement on the "real original Rob Roy," inasmuch as she has more crown, fuller bilge and a sheer of 3½ inches, which must in part account for her very fair behavior in lumpy water. Her keel and stems are of oak, and the keel projects ⅜ inch below the rabbet, making her a steady boat under paddle, and not adding materially to draft but decreasing leeway. The ribs are of red elm, the siding of ⅛ in. cedar, six streaks to the side; deck beams sawed ⅝x¾, and spaced 10 inches apart. For decking Mr. Rushton uses a made original mat with himself and superior to common practice. After decking with 3-cloth in cedar, priming over and puttying, he lays down in a single piece The heaviest Utica Mills bleached cotton, drawn tight and tacked down over the edge, which is then protected by a spruce gunwale strip. A regular carriage finish is then applied to the top, and the boat's deck rendered impervious to sun or weather for all time. The canoe is made a life boat by water-tight compartments, and when empty or half filled will support one hand. She is well ribbed in, corners rounded, the combing of ⅛ inch red elm and 1½ in. high, and light wooden hatches for covering in after the Shadow fashion. The fittings include hatchboard, cushions, paddle steering locks, masts and sails, made of oil clear pine, 1¼ in. at butt, and about 1½ in. diameter at deck. They are supplied jointed for better stowage if desired. Mizzens of spruce 9 ft. and under, and about 1¼ in. diameter. Sails are made of heavy unbleached cotton, the edges hemmed and corded. With brass grummets for lacings and earrings. Paddles and oars are hand made, and of the light ash stock, as a sample in our office will show. Double-bladed paddles vary from 7 to 8 ft. for ordinary service, but for large beam are made as long as 9 ft. They are fitted with nickel-plated sleeve and joint in the centre, and can be turned into a couple of singles or one blade feathered to the other. Yokes for carrying consist of a light frame reaching from gunwale to gunwale, upon the ends of which the boats rest with bottom up. Straps run across the frame and fit the shoulders of the man portaging. Boats built at Canton can be shipped anywhere at nominal expense, $2 to $3 to near by States, $5 to Chicago, $6 to St. Paul and $10 to Florida.

SHARPIES AND KEELS.

Editor Forest and Stream:

Your interesting and valuable paper reaches me every Saturday, and although we cannot be called a religious paper, it is a part of my religeon, after attending church on Sunday, to always read the FOREST AND STREAM. I am particularly interested in your boating articles, being a boating man, and read with much amusement the letter from your correspondent "R. B. H." on "Sharpies and Keels." As he requested some information as to Sharpies I emulated to give him and your many readers "my experience." I have admired the pluck and tenacity that one other correspondent, Mr. Thomas Clapham, has always shown in advocating the seagoing qualities of the Sharpie and of his "Nonpariel" model, and handling a model singlehanded and alone for a year or more in the controversy as to whether cutters and yawls were the only or safe craft for a man to trust his life at sea in. I am not much of a theorist, but have had much practical experience with Sharpies and Keels, and if I had to take my choice of *open* boats for rough water, or dangerous cruising at sea, should take the Sharpie every time and leave the deep and sharp keel at my wharf for pleasant-weather sailing. My business takes me to Beaufort harbor a portion of the year, where I am obliged to employ many boats. Beaufort is situated immediately fronting the ocean from Old Topsail Inlet and the harbor and adjacent sounds are full of shoals. When I first went there, seven years ago, I found the fishermen all using canoes or "dug outs," which are strong and serviceable boats admirably suited for their purposes, but the boats used for business and pleasure sailing were deep, sharp, clinker-built; fast sailers, but totally unfitted for shoal water navigation. I at once decided to introduce the sharpie and gave my order to Graves, of Fair Haven, Conn., for one of his best 34 ft. sharpies. The boat was completed for me the summer of '75 and sailed two races in the sound off Branford the week after she was launched, beating all the cat boats easily, also the famous Law sharpie. The wind was fresh from S. W. and heavy sea. I then brought her to N. C. and the remarks of the natives on the flat bottom craft were amusing. One said he "reckoned" she would go "right smart" off the wind, but would slide off sideways when hauled on the wind; another, that she would do for smooth water, but not in a mill pond. She would not do to go outside. After some weeks I got up a race against the fastest keel boat in the State, a boat that had won many races and had never been beaten. She was deep, sharp and 28 ft. long over all. The conditions of the race were these: I was to sail my competitor to the wind I would beat him on the wind (his best point of sailing) in a heavy weather race of wind and sea, he to select his day and course. The course selected was from Harker's Island Point to the mouth of the inlet, with a strong gale against a heavy S. W. wind blowing directly up the channel from the ocean, making a terrible sea for me with my sharpie. The result was that we beat the keel more than half a mile in a three and a half mile race, but there was not a dry thread on a man in either boat. The result of this race settled the question in this vicinity. My sharpie was determined to should, whether she was seaworthy or not, and since that day at least 500 sharpies and flat bottom skiffs have been built for the waters of Eastern N. C.

During the fearful storm of April, '77 I crossed the sound from Beaufort to Morehead City in one of my sharpies, the wind blowing about sixty miles an hour, carrying my mail and several important messages. At least five hundred persons were on the wharfs witnessing the trip. No other boat crossed for two days. The blustering at Beaufort is not confined on the wind coast, for we have had the most fish in the breakers and rough water of the inlet, and I have yet to see the deep, sharp boat that can follow me in my sharpie when trolling for these fish. Mr. Graves's sharpie for the past two winters has been used as a pilot boat, crossing the bar when very rough and boarding vessels many miles at sea.

My experience has been that sharpies are *not* adapted for sailing in shallow water; that while they will float in a good dew, to sail well they require plenty of water under them, as they "suck bottom" more than sharp boats. Another thing, the sharpie is not the boat for a "landlubber" to fool around in when full rigged. They are very quick in their working and require judgment and experience in handling, but take her with one sail and she is safe for children, or the most inexperienced boy to handle. For heavy weather cruising and fast work the sharpie, rightly managed, I consider the best and safest boat in the world. G. N. I.

THE RECORD FOR CANADA.—From the Toronto *Mail* we take the following summary of the past season: "March 2—National Yachting Association formed at New York. July 1—Race for the Governor-General's cup by yachts belonging to the Royal Canadian Yacht Club; won by the Atlanta. Second-class race at Belleville; won by the Katie Gray, the Gracie being second and the Sylvia third. Second-class race at Kingston won by the Emma, the Una being second and the Laura third. July 23—The Oriole leaves for Chicago on August 4th on the trip. She arrives at Chicago only to find that the race in the regatta there for which she was entered had been declared off, the litter refusing to start. Sept. 1—Royal Canadian Yacht Club regatta. The Prince of Wales' Cup won by Commodore Boswell's Madcap, leading the Atlanta, Alarm and Kathleen. Sept. 2—Fifth annual regatta of the Bay of Quinte Yacht Club. Second-class race won by the Katie Gray, with the Kathleen second and the Emma third. Sept. 23—Regatta at Hamilton. First-class race won by the Coquette, with the Madcap second. Second-class race won by the Gipsey, with the Mystery second. Third class won by the Petrel of Toronto, the Ella of Toronto being second. Race at Belleville between the Katie Gray of Belleville and the Emma of Kingston; won by the Katie Gray. Sept. 28—Mr. J. Bell, Jr., of Belleville, becomes the owner of the Bloodhound.

KIRK'S HIGH SPEEDS.—In our article on the Seiple Yacht Engine, credit for designing and building the hull of the fast steam yacht Zip should be given to Mr. Kirk, the well-known builder of fast steam yachts, whose yard is located at Chester, Pa., and of whose work we have already had occasion to speak.

JEFFRIES YACHT CLUB.—The following are the officers for the year: Commodore, G. A. Palmer; Vice-Commodore, E. T. Pigeon; Fleet Captain, F. E. Johnson; Measurer, Jacob Rood.

CLIO.—Mr. Platt has sold this handsome schooner to Mr. Hathaway of New Bedford.

PUBLISHERS' DEPARTMENT.

See adv. of share in Blooming Grove Park Association for sale.

Holabird Shooting Suits. Upthegrove & McLellan, Valparaiso, Ind.

Young and feeble mothers with frail children will both become strong by the use of Hop Bitters.

TURK.—We call attention to the notice of Mr. Fred. A. Taft, in another column, stating that he has placed his famous setter dog Dorr in the stud. Dorr is a large, bold, powerful dog, of great endurance and was winner of one of the prizes at the Nebraska Field Trials last summer.

W. WILLIAMS & Co., Boston, will shortly publish for the Massachusetts Society for the promotion of Agriculture three colored frames of Des Carrs on pruning forest and ornamental trees, translated from the seventh French edition, with an introduction by Charles S. Sargent, Professor of Arboriculture in Harvard College. It will appear profusely illustrated, each picture being identical with those in the original edition, the engaving of them having been done in Paris. The Society hopes for the work a considerable circulation owing to the low price at which it will be sold, the desire of the members being simply to make widely known the De Corval method of pruning, which is simple, inexpensive and sure.

Answers to Correspondents.

☞ No Notice taken of Anonymous Communications.

F. H. B., Boston.—We cannot say positively as yet. Probably not.

E. L. S., Stamford, N. Y.—We cannot refer you to any other place for quail.

G., Fishkill-on-the-Hudson.—The gun is reliable and of good performance.

W., Elmira.—"Practical Boat Sailing," by Douglas Frazar. Price $1. Can send it.

E. M., Marlboro st., Boston.—Probably not. You would have a better chance by going later.

G., Boston.—See advertising columns. Can send you model for inspection if you conclude to build.

A READER, Pittsburg.—Live quail should not be put down until the weather is pretty warm, say May 1.

E. O., Cleveland, O. You can procure a thoroughbred Irish water spaniel by addressing Mr. J. H. Whitman.

S. B. P., Little Falls, N. Y.—"Wallace's Guide to the Adirondacks" is what you want. We can supply it at $1.50.

O. C. O., Brenham, Texas.—Where and at what price can I buy a "Geo. Burg" gun? Ans. Don't know of such a gun.

J. P., West Tisbury, Mass.—What is the cause of metallic shells expanding? Ans. The chamber of the gun is too large.

C., City.—Canoes come within the scope of the rule for carrying lights. The circular says "boats propelled by hand power."

B., San Francisco.—You will find Corinthian rules of Seawanhaka Y. C. in our issues of May 15 and June 19, 1879, or see club book.

J. H., New York.—If you will repeat your question, giving weight of gun and signing your name, it will be answered with pleasure.

C. F. B., Rutland, Vt.—You may write to the Winchester Company, whose address will be found in our advertising pages. They can supply the rifle cover.

P. H., Rock Island.—Have Bogardus and Carver ever shot any pigeon or glass ball matches against each other? Ans. Do not recall any such meeting.

F. W., Sullivan, Me.—What is the species of trout called "togue" in Maine? Ans. It is only a local name for the common lake trout, *Salmo namaycush*.

P., Providence.—Oil and paint, or shellac varnish, is certain to make your canoe waterproof. The sugar of lead receipt also gives satisfaction for close canvas. Use 8 oz. duck.

D., Salmon Falls.—See advertising columns for canvas boats. Have received the indorsement of those who have tried them. Write to Mr. A. M. Wardell, Waverly, Tenn., for fox hounds.

H. J. M., Quebec.—We have not seen the article named; it is not yet on the market. It may be good, but the proof of the pudding is not, as some authorities say, in chewing the bag-string.

E., Phila.—Balance jig has yard and boom running forward of the mast one-quarter to one-third their length. See Kemp's Yacht and Boat Sailing. Something like the sail of a Chinese junk.

E. S. Y., Baltimore.—Have brook trout scales? Ans. Yes. They are small, but if you wipe off the slime you can raise them with the point of a knife. If a piece of the skin is dried they show nicely.

H., Minneapolis.—Automatic reel is advertised in this paper. Well spoken of by those who have tried it. Registration in National Kennel Club Book, 25c. Write to Joseph H. Drew, Columbia, Tenn.

W. D. G., Cambridge.—What would be the best time to go shooting coot and other sea ducks on the N. E. coast near Boston during the spring flight? Ans. All through the month of April the birds are flying.

A READER.—For wild rice address Chas. Gilchrist, Port Hope, Ont., or Richard Valentine, Janesville, Wis. For full particulars concerning the sowing and growth of rice see FOREST AND STREAM, Vol. XV., pages 168, 251, 269, 331.

H. J. L., Chicago, Ill.—The gun is first class. It will stand any reasonable charge of powder, and there is no fault to be found with the action. Several of the guns have been burst with the "Dittmar Sporting Powder," but that is nothing to their discredit.

H., Eastport.—It is common for builders to ask fabulous sums for cutters. The mere name frightens many. Excluding ballast, they are cheaper to build than the usual run of sloops. Allow same figures and you will be giving very fair price.

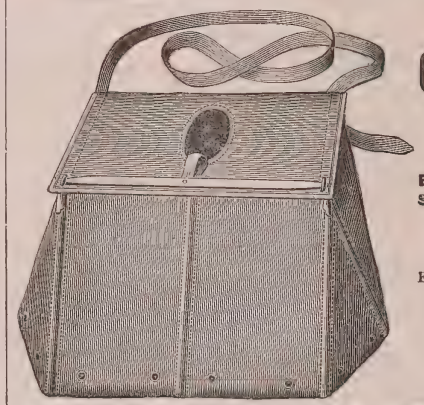
F., Buffalo.—Allowing so many hands to yachts in Corinthian matches is a remnant of the sport's babyhood. One for 9 or 10 feet, fractions thereof not to count, is enough. Shifting live ballast should be discountenanced just as much as shifting bags.

B., City.—Cutter for four hands from 26 to 36 ft. water line, one-third same for beam on load line and 45 to 50 per cent. of beam for depth and draft. Can be built for same money as ordinary sloop. Price for cutter, 30 ft. load line, about $1,000 with iron ballast.

D., Columbus.—Racing rigs for open boats have no limit. Depends on how much ballast you shift and how much disregard you have for capsizing. Large rig will be: Hoist of mainsail, 21 ft.; foot, 26 ft.; head, 15 ft.; foot of jib, 19 ft. Your fixed ballast: Hoist, 17 ft.; foot, 24; head, 14; jib on foot 15. Much depends upon style of boat.

M. A., Yonkers.—What is the cause of the scarcity of sea gulls on the river this winter? Perhaps the extreme cold has driven them further South. Last winter there were hundreds of them; this winter you can scarcely count ten any time. Ans. We cannot answer your question without knowing more about the facts. Perhaps from some unknown cause food is scarce.

J. ANNIN, JR., Caledonia, N. Y.—What is the inclosed fellow? The man in Colorado who sent it to me calls it a shrimp. It is not like our shrimp (*Gammarus*), but is it a different animal? Ans. It is the larva of some insect. An insect has six legs. Your "shrimp" is a decapod (ten feet). When you find any crawling animal in the water with six legs you may be sure that it is the larva or pupa of an insect.



A. A. A., Port Perry, O.—1. Do Mascalonge, *Esox nobilior*, shed their teeth annually? 2. Is Red Rock, on the Nepigon River, still a Hudson Bay Company's post, and can supplies for camping be obtained there as formerly? Ans. 1. There seems to be no regularity in the shedding of the teeth, they lose one and it is replaced. 2. It is still a post and necessaries can be obtained there, but no luxuries. Better not depend too much on it.

T. L. McK., Brooksburg, Ind.—Shooting geese last fall I loaded 12 gauge U. M. C. Co. paper shells with 4 drams of powder and 1¼ oz. of shot (weight of gun 8½ lbs.). I found that many of the shell heads burst so as to let the gas escape which caused the gun to foul at the breech. My partner, using a 9 lb. gun with same loads, experienced same trouble. Did we overload, or were the shells bad? Ans. The shells were bad, or did not fit.

W. W. B., St. Davids, Canada.—As the close law for all game is on, shooting matters are at a standstill, with the exception of coweens. The latter are affording excellent shooting, which can be pursued more pleasantly a little later on when the thermometer gets higher. By the way, I see you call them "old squaws." Now, what are known here as "squaws" are entirely different. They are large, black ducks, having a white speculum on wing, and are stupid and sluggish. Which is correct, and "who shall agree when doctors differ?" Ans. The old squaw proper is what you call coween. The large black duck is *Œdemia perspicillata*, the white-winged surf duck or coot.

—Any subscriber or reader of FOREST AND STREAM in want of any kind of carpetings, oil cloths, rugs, etc., etc., can be sure of fair treatment at the hands of John H. Pray, Sons & Co., Boston. Call or correspond with them, and get their prices before buying. It will pay you to try them.—*Adv.*

KING HUMBERT'S HUNTING-GROUND.—This royal domain of Licola, near Naples, is one of the most strictly preserved of all the king's hunting-grounds, and is kept at very little expense. It consists of a vast expanse of swamp, intersected with water-dikes, hidden between a mass of reeds and full of water-fowl, of open lake and of oak copses, where the larger game—stags, deer, wild boars and a kind of wild goat—find sufficient nourishment in the shrubs, tender leaves, acorns, herbage and roots. Only in exceptionally severe seasons must some additional food be provided. The preserve has not been shot over now for three years, and contains more than a thousand head of large game. It was a favorite haunt of the late king, and his son, who is perhaps a still more passionate sportsman, takes a great interest in it, and will probably come to Naples this winter to enjoy sporting over this, one of his best preserves The hunting lodge is a substantial house, consisting of a ground floor and one story, stuccoed and stained a pinkish yellow. It stands on a kind of grass-grown common, with groups of magnificent evergreen oaks on either hand, while opposite is a tiny chapel, with two or three acacia trees.

WILD TURKEYS.

NOTICE, SPORTSMEN.—I manufacture turkey callers that make a perfect imitation of either an old or young turkey. They are nothing like the bone or pipe-stem caller, which require weeks' practice to use correctly. Ten to thirty minutes' practice on my caller will enable you to fool the old hunter as well as the turkeys. Each one is warranted as represented. Sample by mail, prepaid, 75 cts. Discount to trade. P. O. stamps taken. Address H. C. NEWTON, Box 763, Mt. Vernon, O.

BRAIN AND NERVE FOOD.
VITALIZED PHOSPHITES.

Composed of the NERVE-GIVING principles of the ox brain and wheat germ. It restores to both brain and body the elements that have been carried off by disease, worry, overwork, excesses or nervousness. It promotes digestion and strengthens a failing memory. It prevents debility and consumption. It strengthens the brain, gives good sleep, and recuperates after excesses. Physicians have prescribed 300,000 packages.

For sale by druggists or mail, $1. F. CROSBY, 664 and 666 Sixth Avenue, N. Y.

GRAND EXHIBITION
— OF —
BROOK TROUT.

Important to Fisheculturists!

All parties that have Brook Trout that they desire to market this season will find it to their advantage to

CONSIGN THEIR FISH TO ME.

I shall make my usual display (on April 1 and 2) of Trout, both alive and dead, from all the leading Fisheculturists in the United States and Canadas. Specimens are also expected from France and England.

Do not ship any Trout to arrive before the morning of April 1, as THEY WILL NOT BE RECEIVED.

All Trout that are intended for the exhibition should be packed carefully and marked,

"FOR EXHIBITION."

EUGENE C. BLACKFORD,
80 Fulton Market, New York.

FARRAR'S POCKET MAP of Moosehead Lake and the North Maine Wilderness, a valuable companion for the sportsman, hunter and lumberman. 50 All Gold, Chromo & Lily Cards, (No 2 alike), Name on, 10c. CLINTON BROS., Clintonville, Conn.

The Kennel.

FOR SALE.—THE BLUE STAR COCKER SPANIEL BREEDING KENNEL.—I will sell reasonably, owing to poor health and lack of private business cares, which will call for all the spare time I care to give in the future, and also enable me to complete my unfinished work on breeding, breaking and management of Spaniels for American Sportsmen. Therefore I offer as above my Kennel stock, all accessories, together with Kennel name and good-will, to any one having the taste and competent to carry on the good work well. The demand for this breed is immense. Over five hundred pups would have been sold last year (1880) from this Kennel had we had them. My price, $4000, is extremely low, considering its well established reputation and lucrative facilities. I will give all time and advice required, gratis, to the successor. One having breeding experience is preferred, and would like to hand over before June next. Only parties meaning business need apply. M. P. McKOON, Proprietor, The Blue Star Kennel, Franklin, Del. Co., N. Y. Mar10,1f

FOR SALE—Red Irish Setter Dog, Imp. Grinsa, by Moore's Rufus ex Twigg's Kate, 2nd prize, Dublin, 1877; Rufus, by Palmerston ex The Queen; Kate, by Paisley (a Palmerston) ex Moore's Flora, dam of Mina and several other champion and prize bitches. Grinsa won 2nd open class and Y. H. C. champion class, Baltimore, 1878, when but 12 mos. old. Only time ever shown.

Red Irish Setter Bitch Rosina by Imp. Grinsa ex Imp. Bella; Bella, by Dr. Boyd's Paisley ex C. Moore's Bell; Bell, by C. Moore's Old Shot (father of Palmerston) ex Old Kate. Both the above dogs were thoroughly broken by Mr. Gladson, now with Mr. Orgill. Also the Chesapeake Bay dog Greek, by Mr. Jno. Stewart's Turk ex Mr. Martinet's bitch. Address GEORGE BROWN, No 4 Exchange Place, Baltimore, Md. mar17,1t

FOR SALE.—A large, healthy dog pup, 11 months old, by Pontiac (Pride of the Border-Petrel) out of Fay's Judith (Rob Roy-Gause's Belle); color white, dark ears, blue and tan ticks, a blue blood, handsomely marked, $50. Address ROB ROY, P. O. Box 2231, N. Y. city. Mar17,2t

RED IRISH BITCH LUCY, 4½ years old, out of Moya-Plunket, bred by David G. Hartt, Northport, N. Y.; thoroughly trained in all respects and prize winner. Offered for sale because owner has no use for her; price, $80—not half her value. Address BOX 293, Norfolk, Va.

A BARGAIN.—A beautiful Gordon setter pup; color, black and tan; from the most noted stock in the country. Her sire is the best dog on game in Lancaster County; price, $30. Also a lemon and white Llewellin pup, 6 months old; will make a good one. Dam, Lady Elgin by Carlowitz; sire, Zanzibar by Champion Gladstone and Mersey; only $30. H. B. VONDERSMITH, Lancaster, Pa. Mar17,1t

I WILL SELL OR EXCHANGE my Irish setter dog, one year and a half old, for a breech-loading gun. J. H. SHIRK, 337 N. Queen st., Lancaster, Pa. mar17,1t

FOR $30 I will sell a setter of Dan't Webster stock that has been hunted two seasons on woodcock; would exchange for a 12 B. L. shot-gun and pay boot. A. S. GUILD, Lowell, Mass. Mar17,1t

FOR SALE One extra fine, high-bred pointer dog, 10 months old; price, $30. Also three bitch pups, highly bred and handsome, 3 months old; $10 each. JOHN L. MARTIN, Milford, Mass. Mar17,3t.

FOR SALE.—Irish setter bitch Quail III., 3 years old, broken; 1st puppy class 1878; 2d, 1879. Address E. L. 171 East 87th street. Mar17,1t

EXCHANGE.—$25 pointer dog for breech-loading rifle. Address D. W. ROY, Monday, Hocking county, O. Mar17,2t

FOR SALE.—My Gordon setter bitch Rose, 14 months old; color, a beautiful black and tan, partly broken and very fast; price $20. Address W. N. WHITE, Box 68, Portsmouth, Va. Mar17,1t

RICHARDSON AND RANGELEY LAKES ILLUSTRATED, a thorough and complete guide book to the Rangeley Lake Region, Kennebago, Cupsuptic, Parmachenee and Connecticut Lakes and the head waters of the Connecticut, Magalloway, Androscoggin and Dead rivers; illuminated covers, tinted paper, 320 pages, 60 illustrations and a large map, made mostly from accurate surveys. Price, post-paid by mail, 50 cents. CHARLES A. J. FARRAR, Jamaica Plain, Mass.

Hornbeam Rods

A SPECIALTY.

W. HUNTINGTON,

WILTON, CONN.

Makes a specialty of the manufacture of FINE HAND-MADE RODS of Hornbeam for fly-fishing. Every fly-fisher should have one of these rods, for whatever preference he may have these are the only thoroughly reliable rods, secure against breakage and capable of real hard usage. With one of these rods a sportsman may venture into the woods for a season and take no other rod, and be fairly sure of returning with it in serviceable condition. As made from wood of my own cutting and seasoning, they are powerful, easy in action and full of endurance. For circular send to WALLACE HUNTINGTON, as above.

TO ANGLERS:

"THE FISHING LINE."

TAKE THE

Grand Rapids & Indiana R.R.

Mackinaw, Grand Rapids and Cincinnati Short Line

FOR THE

Trout, Grayling, and Black Bass Fisheries,

AND THE

FAMOU SUMMER RESORTS AND LAKES OF

NORTHERN MICHIGAN.

The waters of the

Grand Traverse Region

and the Michigan North Woods are unsurpassed, if equaled, in the abundance and great variety of fish contained.

BROOK TROUT abound in the streams, and the famous AMERICAN GRAYLING is found only in those waters.

The TROUT season begins May 1 and ends Sept. 1.

The GRAYLING Season opens June 1 and ends Nov. 1.

BLACK BASS, PIKE, PICKEREL and MUSCALONGE, also abound in large numbers in the many lakes and lakelets of this territory.

The sportsman can readily send trophies of his skill to his friends or "club" at home, Ice for packing fish can be had at many points.

TAKE YOUR FAMILY WITH YOU. The scenery of the North Woods and Lakes is very beautiful; the air is pure, dry and bracing. The climate is peculiarly beneficial to those suffering with

Hay Fever and Asthma Affections.

The hotel accommodations are good, far surpassing the average in countries new enough to afford the finest of fishing.

During the season Round Trip Excursion Tickets will be sold at low rates, and attractive train facilities offered to Tourists and Sportsmen.

Dogs, Guns and Fishing Tackle Carried Free at owner's risk.

Hornbeam Rods

A SPECIALTY.

W. HUNTINGTON,

WILTON, CONN.

Makes a specialty of the manufacture of FINE HAND-MADE RODS of Hornbeam for fly-fishing. Every fly-fisher should have one of these rods, for whatever preference he may have these are the only thoroughly reliable rods, secure against breakage and capable of real hard usage. With one of these rods a sportsman may venture into the woods for a season and take no other rod, and be fairly sure of returning with it in serviceable condition. As made from wood of my own cutting and seasoning, they are powerful, easy in action and full of endurance. For circular send to WALLACE HUNTINGTON, as above.

GUNPOWDER!

Dupont's Rifle, Sporting and Blasting Powder.

THE MOST POPULAR POWDER IN USE!

DUPONT'S GUNPOWDER MILLS, established in 1802, have maintained their great reputation for seventy-eight years. Manufacture the following celebrated brands of powder:

Dupont's Diamond Grain.—Nos. 1 (coarse) to 4 (fine) unequalled in strength, quickness and cleanliness; adapted for glass ball and pigeon shooting. Packed in 1lb canisters.

Dupont's Eagle Ducking.—Nos. 1 (coarse) to 3 (fine); burns slowly, strong and very clean; great penetration, with a close pattern; adapted for glass ball, pigeon, duck and other shooting, with either muzzle or breech-loaders. Packed in 1lb and 5lb canisters and 6¼ and 12½lb kegs.

Dupont's Choke Bore.—Specially adapted for "Choke Bore" Guns, and particularly for prairie and upland shooting. Burns slowly, strong and moist; does not cake or burn on the barrels, gives both a good penetration and a close pattern, will be found well adapted for glass ball and pigeon shooting. Made of two sizes, only No. 7 and No. 6, No. 7 being the coarsest. Packed in 6¼lb kegs and 1lb canisters.

Dupont's Eagle Rifle.—A quick, strong and clean powder, of very fine grain for pistol shooting. Packed in 1lb canisters and 6¼ lb kegs.

Dupont's Rifle Fg. "Sea Shooting."—FFg. and FFFg. The Fg. for long-range rifle shooting, the FFg. and FFFg. for general use, burning strong and moist. Packed in ⅛lb, 1lb and 5lb canisters, 6¼, 12½ and 25lb kegs. Fg coarse, FFFg. fine.

Dupont's Sporting, Mining, Sharping and Blasting Powders of all sizes and descriptions. **Special Grades for Export.** Also Rifle, Cartridge, Musket, Cannon, Mortar, Mammoth, Hexagonal, Cubical and Pellet Powder, U. S. Government Standard.

Powder manufactured to order of any required grain or proof.

Agencies in all the cities and principal towns throughout the United States. Represented by **F. L. KNEELAND, 70 Wall Street, N. Y.**

N. B.—Use none but DUPONT'S Fg. or FFg. for long-range rifle shooting.

The Hazard Powder Co.,

MANUFACTURERS OF

GUNPOWDER.

Hazard's "Electric Powder."

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of one pound *only*.

Hazard's "American Sporting."

Nos. 1 (fine) to 6 (coarse). In 1 lb. canisters and 6¼ lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to shot guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6¼ and 12½ lb. kegs. Burns *slowly* and very clean, shooting remarkably close and with *great penetration*. For field, forest, or water shooting, it ranks any other grain, and it is equally serviceable for muzzle or breech-loaders.

Hazard's "Kentucky Rifle."

FFFG FFG, and "Sea Shooting" FG in kegs of 25, 12½, and 6¼ lbs. and cans of 5 lbs. FFFG is also packed in 1 and ½ lb. canisters. Burns strong and *moist*. The FFFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard *Rifle* Powder of the country.

Superior Mining And Blasting Powder.

GOVERNMENT CANNON and MUSKET POWDER; also, SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF, MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's Agents, in every prominent city, or wholesale at our office.

TO CORRESPONDENTS.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen.

Communications upon the subjects to which its pages are devoted are invited from every part of the country.

Anonymous communications will not be regarded. No correspondent's name will be published except with his consent.

The Editors cannot be held responsible for the views of correspondents.

All communications of whatever nature should be addressed to the Forest and Stream Publishing Company, Nos. 39 and 40 Park Row, New York.

FOREST AND STREAM.

Thursday, March 24.

THE COMING TROUT SHOW.

WE have received an elegant chromo made expressly for Mr. Blackford's invitation "to inspect all procurable varieties of trout" and other cultivated fish, at Fulton Market, on the 1st and 2d of April. The card is really a gem, and worthy of a frame. It represents a trout in the foreground inspecting a gaudy insect, while in the back an angler is wading a rapid stream, which tumbles over the rocks in such a natural manner as to make us wish to be there. On the next page is the invitation, flanked by rod and landing net, while a charming rural scene with tumbling water stands above.

We hope our fish culturists will send Mr. Blackford specimens of their apparatus and implements, for which he asks in our advertising columns, as this may be the means of inaugurating a yearly exhibition of fish culture which may extend in future years to a great fishery exhibition. Mr. Blackford's "trout openings" have grown from the ordinary display of a dealer into what they now are, interesting studies for the angler, the ichthyologist, and the epicure, and are already as large as the limits of the dingy old market will allow. Great credit is due Mr. Blackford for these displays, for he is the only fishmonger who sinks all considerations of profit and brings specimens from all parts of our own country, even from the far Pacific coast and from Europe, at a cost of one hundred times their market value, to treat the public to a comparative view of the different species and varieties, filling his slabs with them to the detriment of his other business. For all of which the trout, at least, owe him much gratitude.

A LARGE NUMBER OF REPLIES to our queries in regard to the comparative effect on the game of still hunting and hounding deer are now on our table awaiting publication. Just at present the pressure upon our space is so great that this matter must be laid over for a week or two. Correspondents who have furnished us with their views on this important topic will understand that their articles will all appear at the same time.

NEW FACTS ON GAME PROTECTION.

A SATISFACTORY and sufficient plan for game protection is one of the most pressing necessities of the times. Year by year the sportsman sees the game in localities easily accessible to him becoming more scarce; year by year he has to travel further and work harder in order to secure the objects of his pursuit, and year by year his reward, in proportion to the energy expended, is less than it was in former times. That a satisfactory and efficient code of game laws will ultimately be enacted and enforced we cannot doubt, but before such a consummation can be reached it is highly probable that, in many of the more densely populated sections of the country, wild game will have entirely disappeared. We can call to mind too many localities, where twenty years ago quail and ruffed grouse were quite abundant, which are now so destitute of these birds that one of them in a state of nature would be regarded by the inhabitants with unqualified admiration and curiosity. The longer such complete extermination for any locality can be postponed the better, and the men who shoot and fish, appreciating the position of affairs and foreseeing that unless something is done the outlook is most discouraging, are now displaying more energy in restocking our covers and waters than ever before. Probably there have never been so many quail in confinement as there are at present. The almost unparalleled severity of the past winter has undoubtedly destroyed a very large number of the birds in the north, and realizing this, many persons are importing quail from the Southern States, where the suffering has been less, and are putting them down on the land where they do their own shooting. If the birds do well and can be preserved till the beginning of the season, it is obviously cheaper to do this than to travel some hundreds of miles for a few days' shooting when the season opens.

There are still many places within easy reach of New York where fair bags, say from eight to fifteen birds to a gun, can be made; but in too many localities where a few years ago birds were fairly abundant they are now unknown. Such localities are numerous in New York and Connecticut, and no doubt in other States. Where this is the case the birds have simply yielded to their enemies in the struggle for existence, and can by restocking and proper protection be made as abundant as ever. Reasonable game laws, strictly enforced, a short period for selling after the close of the season, a bounty on hawks, owls and foxes, and proper attention to restocking will in the future give us fair shooting.

Perhaps the most serious difficulty with which we have to contend in preserving the quail is the weather. It must be remarked that as any part of the country becomes more and more thickly settled, the swamps and underbrush are cut off, the land cleared, the hedgerows carefully trimmed, and little cover is left for the birds. Unless a general and organized effort to find and shelter the birds is made by farmers and sportsmen residing in the country, a single severe winter may undo the work of years of careful protection. The past season has been a hard one, and large numbers of quail have undoubtedly perished from cold and hunger, yet it has not been one of those in which the quail of a whole section are swept out of existence in a single night. The birds that have died this winter would seem, for the most part, to have perished one by one of cold and hunger. The snows have been so deep that all the food has been covered up, and lay upon the ground so long that the birds, weakened by starvation, readily yielded to the bitter cold. Moreover, the snow line this year extended so much farther south than usual that it has reached birds wholly unaccustomed to any great degree of cold, and thus wholly unfitted to withstand the severities of the season. We have, however, had none of the heavy snow-storms, changing during the night to cold rain, and thus forming a crust which effectually prevents the escape of the poor little prisoners beneath.

In order that we may have an adequate conception of what is required for the more perfect preservation of our game, it is essential that we should obtain all the facts possible with regard to it, and keep ourselves constantly informed as to its condition. With this in view, it has appeared to us particularly desirable to learn as nearly as possible just how the quail have fared this winter in our middle districts. Various opinions have been expressed on the subject, and men of experience have been found to differ widely about the matter. It has seemed to us, therefore, that the most certain and satisfactory way of arriving at a definite conclusion would be to make a thorough canvass of some one section, obtaining if possible reports from at least two different individuals in each town. Reports from the West seemed to indicate that the birds had suffered less than in the East, and it was, therefore, after mature consideration, determined to limit the proposed inquiry to the State of New Jersey.

The geographical position of this State makes it particularly favorable for such an inquiry. Its northern extremity is in about the same latitude with New Haven, Conn., while its southern is on the same parallel with Washington. Reaching as it does so far to the north and south, it may fairly be supposed to represent the condition of things which exists in Southern New York and Connecticut, in Pennsylvania, and a portion of Maryland and Delaware. It thus really covers more ground than any other single State that could have been selected.

We have been fortunate in securing from our hundreds of correspondents scattered through New Jersey very full reports of the present condition of the game there. Many of these reports are models of conciseness, and in most instances we have printed them almost without alteration, or, if it was necessary to condense them, have preserved the style of the writer and have given his facts as he stated them.

We have preferred to print the reports in full rather than to content ourselves with summarizing them, in order that each of our readers may see for himself precisely what the sportsmen of New Jersey think of game prospects in that State for this fall.

Never before has such an inquiry as the present one been set on foot in this country, and we think it not too much to say that the movement is a long step in the direction of intelligent game protection. One important result of our investigations will be to furnish to the New Jersey Legislature some definite information on which to base certain proposed changes in the game laws, information the like of which no legislative body has ever before had access to.

We think that sportsmen generally will appreciate the value of the statistics which we print to-day, and it is unnecessary to dilate on the subject. No one, however, can appreciate the amount of labor and expense entailed in the compilation of such a complete report, and one covering so thoroughly such an extent of territory. These are expenditures which we shall not grudge if the cause of game protection has been served by our efforts.

We have once or twice heard it suggested by envious people that the FOREST AND STREAM was "aristocratic," that it favored measures which would make the enjoyment of legitimate sport by the poor man more difficult. When the course of this journal is examined, so childish and untrue a statement scarcely needs denial. We urge the passage and enforcement of stringent laws in order that the game at our doors may be preserved. The rich man can travel to distant fields where game is plenty, and can have his shooting whether the laws are enforced or not. With the poor man it is not so; he has to take his day or his half day in the field when he can get it, and has neither the time nor the money to travel far in search of game. It is, therefore, the man of modest means who is or should be interested in game preservation even more than he whose fortune is ample. But no question of class or fortune should enter into a question of this kind. All men, and especially all sportsmen, ought to be of one mind on this matter, and all should unite with the heartiest good will in furthering to the utmost of their ability any plan that will bring about the end we all so much desire.

TO ADVERTISERS.—We have recently made arrangements by which during the next six months we shall circulate, in addition to our regular large weekly edition, six thousand copies of the FOREST AND STREAM in the United States and Europe. This large extra edition will be mailed from the office of publication in single wrappers and singly addressed to the best names in the more important towns of the Union. As our advertising space is limited and is now almost full, those who desire to make especial efforts to secure the spring trade, would do well to secure what space they need in good time.

ASSEMBLY BILL NUMBER 242 contains a provision which, notwithstanding some crudities, bespeaks the cordial support of all sportsmen. The bill referred to is entitled "An Act to amend chapter five hundred and thirty-four of the laws of eighteen hundred and seventy-nine," entitled "An Act for the preservation of moose, wild deer, birds, fish, and other game," as amended by chapter five hundred and thirty-one of the laws of eighteen hundred and eighty. Section 9 of this bill reads as follows:

Section thirty-one of said act is hereby amended so as to read as follows:

§ 31. A State bounty of thirty dollars for a grown wolf, fifteen dollars for a pup wolf, [and] twenty dollars for a panther, *one dollar for a fox, one dollar for any hawk except a night-hawk, and one dollar for any owl except a screech-owl*, shall be paid to any person or persons who shall kill any of said animals *or birds* within the boundaries of this State. The person or persons obtaining said bounty shall prove the death of the animal *or bird*, so killed by him or them, by producing satisfactory affidavits and the skull and skin of said animal, *or the head and claws of said bird*, before the supervisor and one of the justices of the peace of the town within the boundaries of which the said animal *or bird* was killed. Whereupon said supervisor and justice of the peace, in the presence of each other, shall burn and destroy the said skull and brand the said skin of *said animal*, so that it may be thereafter identified, *and shall burn and destroy the said head and claws of said bird*, and issue to the person or persons claiming and entitled to the same an order on the treasurer of the county to which said town belongs, stating the kind of animal *or bird* killed, the date of killing the same, and the amount of the bounty to be paid in virtue of the within section of this act, and the county treasurers of this State are hereby authorized and directed to pay all orders issued as aforesaid; and all orders issued in the manner aforesaid and paid by the treasurer of any county in this State shall be a charge of said county against the State, the amount of which charge, on delivery of proper vouchers, the comptroller is hereby authorized and directed to allow in the settlement of taxes due from said county to the State.

There is little doubt that the setting a prize on the heads of vermin would have a very marked effect in increasing the game in any section of the country, and while the bounties offered in this bill are in some cases high, they would cause a diminution in the number of our foxes, owls and hawks that would send joy to the heart of every game bird in the land. Some such provision should certainly be added to any bill amending the game law which may be passed by the Legislature this season.

There are a number of other excellent points about Bill No. 242, which unfortunately we have not the space to notice at present.

The Sportsman Tourist.

THE VOYAGEURS OF THE UPPER LAKES.

SINCE the opening of Lake Superior to general navigation by the completion of the Sault Ste Marie Canal, and the common use of steam in the commerce of the upper lakes, the old-time occupation of the "voyageurs" upon those great waters has ceased. Most of the trade with the great Northwest in the world which was conducted by the enterprising Northwest Company found a depot at Fort William, and the carrying was done principally by the voyageurs in canoes. Their main course was up the Canadian rivers, chiefly the Ottawa, through the Georgian Bay and up the St. Mary's River to Sault Ste Marie, and thence around the northern shore of Lake Superior to the Fort. From that point these hardy men found their way into the great wild country far up into high latitudes wherever there were furs to be bought. In those days the passing of "brigades" along the "North Shore" was of common occurrence. Some small sail vessels were occasionally used, but the great bulk of the transportation between Sault Ste Marie and Thunder Bay was by canoes. The Hudson's Bay Company took its supplies from the Hudson's Bay ports up the rivers into the interior, and over the great fur land the competition between the two great organizations, always sharp and severe; frequently became a matter involving lawless strife and bloodshed. Since the union of these great trading companies the Hudson's Bay Company has had a clear field, to the best interests both of the company and, it is believed, the Indians.

The present upper lake voyageur is of a later generation, and knows of the great rivalry mainly by tradition. The skirting of the great lake, the stirring adventures by flood and field, the trapping in the great woodland region, the fierce contests between the retainers of the two great companies, he recalls only as memories of a half-forgotten tale. A few of the old men may remember the Northwest Company as an actual existence, and occasionally the traveler meets with one who has scars to show for his share in the bloody strife which for many years was waged over the profitable fur trade. The greatest pride of such a one is his connection with the Northwest Company in his youthful days, and his later service with the Hudson's Bay Company.

The original voyageurs were for the most part descendants of the French or French Canadian traders and of the Indians inhabiting those parts of the country where the fur trade, or the commerce growing out of it, was carried on. Occasionally, however, though not often, one finds in the present-day voyageur a well-marked descent from Scotch ancestry, and I remember traveling with one most unmistakably Irish. But the amount of white blood coursing through their veins would puzzle a life insurance actuary to determine, even if he had the whole family tree before him. In many of the modern voyageurs it is hard for the ordinary observer to discern traces of the aboriginal blood from any physical characteristics; but personal acquaintance develops mental and moral traits which one naturally attributes to Indian descent. These may result from youthful associations and class habits, but it would seem that they are most easily accounted for by ancestral blood.

I do not know elsewhere of any such combination of personal qualities as I find in the modern Northern Lake voyageurs. The American backwoodsman has the bravery, the coolness in trial, the caution and the hardihood, but hardly the versatility, the sprightliness or the good humor of the voyageur. The pioneer of the "States" is more bluff and hearty than the voyageur, is like in superstitious feeling, but lacks his religious character, his respect for forms and priests and churches. The early Jesuit missionaries molded the Indian mind into a strong reliance upon the Church and spiritual teaching, and the early devotion of these pious men has been well repaid in the attachment for centuries of the Indians to the Roman Church.

The voyageur combines the improvidence of his red with the foresight of his white progenitors. He is generous and hospitable, careless and indifferent. He will feast a stranger in his own camp to-day and go on short commons alone to-morrow, equally ready to divide his own or the stranger's last crust. He is lavish and wasteful as to food, but careful and economical as to ammunition and tackle; and as to the hundred things which accident or disaster in flood or wood may make indispensable, he is thoughtful and provident. He is fruitful of resources, stoical in hardship, content with anything which comes to him and thankful for a little. Physically superior to the average Indian as also to the average white, he shrinks from no labor or hardship which must be met, but wanting somewhat of the spirit of his white ancestry, waits to meet it, instead of meeting it half way. Face to face with danger or privation he is a hero; in anticipation he is a coward.

His life is much upon the water. He is a good sailor when out of reach of the shore. But a stiff breeze, a wet sheet and a flowing sea he never encounters when it can be foreseen or avoided. This trait may come as much from the French as the Indian side of his ancestry. He never braves the elements at the start like a "born" sailor, but, being in, he meets bravely whatever may come. I never saw but one frightened at wind or sea and he was not so much demoralized as to sail unsafely. But on the other hand, I never knew one to venture of his own accord, unless the signs seemed propitious. He is a shore-seeker, like Kinglake's Greek sailors in Eothen. "Indeed, they have a most unsailor-like love for the land, and I really believe that in a gale of wind they would rather have a rock-bound coast upon their lee than no coast at all." But in a storm he manages his small craft admirably. Once coasting the "North Shore," south of Pic River, in a "big wind" upon one quarter, and seas so high and black that each of us instinctively selected his oar upon which to try to reach the shore when the waves should overwhelm us, when the knowledge of the guide and a study of the chart failed to show even a boat harbor for miles, and the case looked desperate, our voyageur's spirit rose to the occasion. His skill in avoiding the seas which threatened to swamp us was wonderful; and when, after making thirty miles in two and three-quarter hours, we rounded into a little harbor at the lower end of Otto Island, we felt a grateful appreciation of the masterly skill which had brought us through, and which we shall never forget.

But with all his skill and courage he is too timid to undertake a new course. He will follow the old shore canoe-line, where, with a straight course a half-day's pulling or sailing would be saved. It was not till I had been many times on the old route from Maimanse Point to Gros Cap, on Lake Superior, that I could prevail on a voyageur to take a straight course inside of Sandy Islands. The most intelligent voyageur I ever sailed with could not be prevailed on to go outside of Maple Island, whether sailing or rowing, in wind or calm. Maple Island is not more than a fourth of a mile in diameter; but the loss of a canoe in making the outside passage forty or fifty years ago and the drowning of four men is not forgotten yet.

Upon one occasion we left Montreal Island for Point of Mines, which bore, as nearly as I can remember, S. by E. a distance of twelve miles. The island is about W. or W. by S. from Montreal River, at the mouth of which is the nearest land from the south end of the island, and six miles distant. I handed the compass to the bow oarsman to steer by, the fog being heavy, with the understanding that he would head for our destination. My surprise may be imagined when in an hour and a half I heard the dash of the swell upon the shore, and the bold and rounded rock which marks the entrance of the river came dimly into view through the fog. We had then to creep slowly along the coast from point to point, adding a full hour's hard pulling to the severe day's work before we came to camp in the little bay.

A "traverse" is the thing to be guarded in a voyageur's life. He spends a good portion of a trip in depicting the dangers of the next "big crossing." It is true the lakes are treacherous, but his fears make the staunch Mackinac boat but little better in a traverse than a frail bark canoe. It is rather trying to one even well versed in the voyageur's peculiarities to see seven or eight miles take the place of four or five, because by the additional distance up the bay the "crossing" will be somewhat shortened. Every traveler with voyageurs or Indians will recall enough instances of this kind. Even an island in mid passage seems to give no confidence. I have tried time and again to get some explanation of this peculiarity, but could only learn that their fathers did likewise. But this trait is the voyageur's by Indian descent alone. I have observed it in the canoe Indians wherever I have come in contact with them.

The voyageur is not weatherwise, because he is not observant of cause and effect in meteorology. He recognizes to some extent the law of periodicity in weather, and relies more upon it than upon any other one element. But he fails in observation of the various conditions which so frequently modify its actions. His predictions are as often mere guesses as those of the average white man. This is true of the Indian, as well.

He is observant and knowing of the habits of fish, which he takes by spear or net, so far as to know the best times and places of capture. And the same remark would apply to the habits of game and fur-bearing animals, but as to the facts lying beyond this range he is as ignorant as other men. He hates snakes like an orthodox descendant of Adam, without regard to their habits or poison. His sight is keen and accurate. He never mistakes a log for a canoe, nor a stump or rock for a wigwam. Nor can you make pass with him the blue haze in the mountains for the smoke of a distant fire. As a marksman he is not successful. He casts a fly with skill and accuracy, but he loses more trout once hooked than an ordinary fisherman. He knows their likely places, and enjoys helping you land them.

Away from towns and civilization he is sober and vigilant; but the trip over, he can get drunk in as quick time as any other human being. In his cups he is not quarrelsome to outsiders; but I have reason to believe the family sometimes suffers. Some never drink to excess; and I have met one or two who professed never to drink at all, which was to be doubted.

Since the finding of some profitable mines on the North Shore he has faith in discovering one which will lift him into riches at once; and a vein of quartz seen along shore will be sufficient to create an excuse for a camp, or, at all events, an unnecessary landing. But he sees in economy and labor no road to competence, yet on an expedition he is industrious and untiring. His honesty is unquestionable; except, possibly, in regard to tobacco, which he is inclined to treat as one of God's good gifts common to all men.

On the trail or coasting, tea is his only stimulant. He insists, whatever happens, on three meals a day; and the fisherman or tourist who tries to avoid one of them will not be treated like a gentleman. But the stores must be watched—not against theft, but waste. Salt, sugar and flour will be left in the rain or on the wet moss of the camp, and pork and potatoes will be thrown away.

In the *cuisine* the *voyageur* is about the average of fishing and hunting guides. Some make good bread; but hard bread should always be carried if practicable. He is proficient in cooking fish and potatoes. I have eaten Lyonnaise potatoes of his cooking as good as in Delmonico's or Parker's; although, no doubt, appetite had a great deal to do with this conclusion. I have seen loaves of bread turned out of a tin oven baked before an open, log fire which would be a credit to any well-managed kitchen. But, as I have intimated, such cases are exceptional.

The true *voyageur* speaks three languages—English, slightly broken, a French *patois* and Chippewa, and many read fairly the first and last of these.

One of the marked peculiarities of the voyageur is his attachment to and care for his boat. He does not have the same feeling in regard to his canoe, probably because the latter is so shortlived. But his boat is always in mind. It is never left in a possibility of danger. How the skies are, or the wind, or the sea, matters little. The bay where you find a camping-place may be perfectly secure from wind and sea—land locked—but the boat must be hauled up on poles and logs clear of the water, and tied with the strongest rope to the furthest tree to be reached. A canoe, however, fares differently. It is lifted from the water, turned carelessly over on the shore, where a boat could never be left.

In the management of boats and heavy canoes the voyageur is superior to the Indian, while in the single light canoe he is inferior. In ascending or descending a rapid his skill is wonderful, and I have seen Indians stare in admiration at his performance. The voyageur is more vigorous, has more active "pluck," or "grit," than the ordinary Indian, and is of better physique, which does not come from the French side alone, but rather from the combination of the two races, or, it might be said, from the combination of the French with the finer specimens of the Indian womanhood, which the French trader was sure to choose. The voyageur is proud of his white progenitors, but hardly looks at his aboriginal ancestry with the same feeling. Indeed, his epithet, expressive of the utmost contempt for another of his own class, is—"Indian."

In the changed conditions of life, I believe the admixture of white with Indian blood has strengthened the mixed race beyond the Indian average. My observation has not been so extensive as to make me confident, but it is my impression that the Indian woman lives to a greater age than the man; at all events, I have seen more aged women than men among the Indians. In the mixed race, however, I believe the men attain the greater average age.

How long the race of voyageurs will last is a problem time alone can solve. The increase of commercial and manufacturing pursuits tends to lead to indoor life more than in earlier years; and when the voyageur becomes a laborer upon railroads, or a workman in mills, he will rapidly lose his distinctive characteristics. Then the sportsman or tourist coasting the shores of Lake Superior, or ascending its rivers, may be reduced for guides to that whiter-blooded mixture of vanity, impudence and laziness, which is so common in the more fashionable outdoor resorts of New York and New England.

H.

A TRIP TO CURRITUCK, N. C.

SOMEWHAT less than a thousand years ago I made up my mind, with that diabolical desperation born of long continued ill-luck, to have a good time with the ducks, if I had to go to Greenland to purchase the enjoyment. I had suffered so many disappointments in the pursuit of the above fickle creatures at and about my Eastern home, that "patience" (never a remarkable feature of my nature) became exhausted, and I was ripe for anything in the way of a change.

An old friend came to my rescue one stormy night, just in the "nick" of time, as I was busy packing up my traps, preparatory to leaving for Wisconsin. He had just returned from Norfolk, Va., and his description of the shooting at "Currituck"—I was going to say, "at—most" took away my breath! I did not waste time in securing my berth on the first outgoing steamer, and was soon on my way—I will not say "rejoicing," for no mortal man ever suffered as I did, I verily believe. The journey was a rough and stormy one, and when I at last arrived at the hotel in the quaint and decidedly romantic city of Norfolk, I praised the "gods" for my safe deliverance. It was a fearful trip, continued through a blinding storm of sleet and snow, and the wind blowing strong enough to almost lift the ship from the water. Glass, crockery, trunks, in fact everything on board, "went to smash" in grand good style, including several of "mine own" wordly goods, which were recovered only by the "greatest sacrifice" on my part, I can assure you. Taking all things into consideration I was thankful to get ashore, although I would have gone through twice the amount of trouble and danger to have had my fondly wished for "Day with the Birds." I left the city long before daylight the next morning on the little steamer Cygnet, and managed to kill time, somehow, principally by smoking, until the broad waters of Currituck Sound glimmered in the distance before us. Quite a throng of men graced the decks of our little craft, and I amused myself listening to the big stories (of course all duck, goose and swan) which some of them told, evidently with the intention of creating a sensation among us "green uns." Thirty-two teal with both barrels (not counting cripples); ten geese with a "twelve" gun, and so on, until I fairly winced under the galling fire. One long-bearded individual in particular, dressed from head to heels in regulation dead-grass color, etc., and fondly cherishing an immense meerschaum, loudly expatiated upon the beauties of a sixteen-gauge on single birds, ye knaw! This heavy gun business was all bosh, ye knaw! He used but one ounce of shot, and would take his chances with the best of them! (particularly on thirty-two teal with both barrels, I thought). So they talked and smoked until we made the landing at Knot's Island—my place of departure. The dock is a queer one, if dock you can call it, simply a shed built on the poles that

start up from the water in the most wonderful fashion and at every angle possible, save the right one. However, I managed to get into the sail-boat with my traps, and off we started. A nice sailing breeze ruffled the water, and the old scow soon had a bone in her teeth worth picking. Thousands of ducks were flying over the vast marshes, and my heart bounded with joy at the sight. Long strings of geese were also flying along the horizon, and I could plainly hear the "hawnk-e-hawnk" of the old ganders. A great many ducks, principally broad bills and butter balls, were continually getting up ah ad of us, and the temptation at last became too strong for me, and I had my old "howitzer" out in short order. I presume I demonstrated pretty clearly to the observant eyes of our skipper that a "pair" was not such very hard work, to say nothing of several sky scrapers and twisting drivers, and before we reached the beach I had really quite a respectable bag. Arriving at the queer old house, with its ship cabin doors and windows, I almost fell into the arms of an old college chum, the last person in the wide world I ever expected to find in that wilderness. Intense joy overcame us, and it was only after the most frequent "smiles" that we arrived at any sort of rationality. My friend had also several cronies in tow, and we were a merry lot of fellows over our roast duck that evening, I can tell you.

After our meal (I did it full justice, believe me) pipes were enjoyed and preparations for the morning's work completed. I retired early, as the long journey from home had fairly begun to show its effects, and I was, to use the familiar expression, "played out." Just at the first peep o' day I was rudely awakened by some one twisting my nose, that noble organ, I'll vow, assuming a dozen shapes, and I found myself vainly striving to reach my gun, which stood in the corner, with the avowed intention of killing the offender if my neck paid the forfeit, while I gave vent to my feelings (as B. said afterward) in the choicest French (?) he had ever heard. Roars of laughter greeted my ears, as sitting up in bed I strove to soothe my poor proboscis and to gain my senses.

Several white-robed figures skipping about and chattering like monkeys with the cold, and casting all manner of remarks at me brought "light out of darkness," and I was soon as busy as the rest. Breakfast over, guns, etc., taken care of, we emerged into the open air, cool and keen, with just a faint breeze, harbinger of what was to follow, bending the tops of the long wild rice.

I had secured for my own especial benefit, as guide, the son of our worthy proprietor, young Beauregard, a lad whom I venture to say is not unknown to many readers of the FOREST AND STREAM, and during my stay, which proved quite a long one, we became the best of friends, in fact inseparable companions. I never saw a better shot for his age in my life, or one who more thoroughly understood his business. It gave me great pleasure to loan him one of my guns, and I well remember the little fellow's joy at possessing the weapon, even for so short a time.

The dawn was fast breaking, and we hurried down to the boats, my friends going to a famous point at a well known club for canvas backs, while "Beau" and I paddled away in the opposite direction, through the wavy forests of rice stalks, starting scores of ducks from their resting places, with many a quack and whistle. I tried my best to cover several as they rose, it seemed almost within reach of the oars, but the darkness prevented. After quite a pull and struggle we reached the point of land—or, tangled weeds rather, that was to form our camp for the day, and Beau was soon at work pitching the decoys, while I arranged things comfortably in the blind.

The breeze became stronger, and I felt a little snow upon my face, but Beau laughed merrily at my somewhat forcible remarks upon the weather. Never mind it, sir! It won't last long; and neither it did. The morning broke gloriously for the duck shooter! Cloudy and cold, a stout breeze, and the birds "all on the move." I could see great bunches of them flying in every direction over the vast fields that stretched away into the dim distance, and obeying the instincts taught me on Long Island's sea-girt shore, I kept myself well concealed. A single bird suddenly came shooting by. With a graceful sheer he turned toward the stool, and a moment more lay dead upon the shore. My first spoon bill, a truly handsome bird.

Single and double shots became frequent, with an occasional flock to rake; and my cup of happiness (to say nothing of the "blind") was almost full. I had a little experience with an eagle during the afternoon which will bear recording. A black duck—hard hit—fell on the ice about eighty yards from us and I walked toward it for the purpose of gathering when, with a mighty swoop and piercing scream, a large bird darted down upon it. The duck, badly wounded, fluttered out of his grasp along the ice, during which time I was running my best to get within gunshot. I gave the tyrant both barrels, but he secured my duck after all and sailed away as totally indifferent to my three ounces of chilled 4's as though he fed upon them. They are a great nuisance at Currituck and destroy any quantity of birds—so Beau informed me.

My glorious day at last was over; and the bag—but, stop! I know full well the danger of enumerating least I also be numbered among the great—"ahem." Suffice it to say there was more than ever I expected to kill, which is saying a great deal, gentle reader; and as to the variety, it was simply sublime. I could boast of but few canvas backs, however, and those few speedily found their way to my friends at home.

I remained at White's for several weeks and enjoyed good shooting most of the time, but the first day was the *creme de la creme* of my experience. BLUE BILL.

BICYCLING.—The annual meeting of the Bicycle Club was held on Monday evening last, and the following officers were elected: W. J. Knight, President; E. H. Snyder, Vice-President; E. H. Bellman, Secretary and Treasurer; L. H. Johnson, Capt.; A. C. Bedell, Senior Sub. Capt.; H. W. Knight, Junior Sub. Capt. and Counsel; Chas. A. Knight, Bugler; E. H. Bellman, Guide. Club Committee: L. H. Johnson, Chairman; H. W. Knight, W. Smith, H. C. Douglass, J. Taylor. After the business of the evening was completed the club sat down to a fine collation at the invitation of the President, and after a very pleasant series of toasts, speeches and songs, the club adjourned at a late hour.

The reports show the club to be in a very flourishing condition, and having a membership of forty-two with more to come, the prospects for a brilliant season seem assured. They hold the championship honors of America and Canada, and propose to hold them another year. J. LAFON.

Ice water is rendered harmless and more refreshing with Hop Bitters in each draught.

Natural History.

ABOUT DEER.

RESPECTING weights of black-tailed deer asked for by you in a late paper in connection with the alleged weight of one of 500 lbs., it will perhaps be best to ask, What is a black-tailed deer? The true one, *Cervus columbianus*, which is often confounded with the mule deer (*Cervus macrotis*) is not by any means a large animal, and if any individual of this species has been killed weighing 500, 400 or even 300 lbs., he must have been a veritable "Daniel Lambert" of his kind. I very much doubt if any black-tailed deer has ever weighed so much, estimating his weight with the entrails out, but with head, skin and legs intact, which is the ordinary and accepted method of weighing deer. I would prefer believing that the deer spoken of as weighing 500 lbs. had been confounded with some other species.

Now, estimated, judged, reckoned or supposed weights are of no use as a matter of record. Not one man in a hundred is capable of judging anything near the correct weight of a deer, and he is often far from the mark. The only weights worthy of being considered are those established by actual weighing, and if this mode were practiced to a greater extent it would be soon apparent to the hunting fraternity and the world at large that the big bucks, so often spoken of as weighing over 200 lbs. would be, like "angels' visits, few and far between." Does, as far as I am aware, never attain this weight, and I feel safe in saying that not more than one per cent. of the bucks do so. Two thousand deer carcasses would not be an outside estimate for those seen by me since living in this country, and when seeing large deer I have made it a practice, when possible, to obtain their weight, and the greatest weight I have any record of is 220 lbs., although I am assured one was killed in this vicinity, and not in good condition either, that tipped the beam at 240 lbs., and this is the only one I ever heard of as attaining such a weight.

Now, in reference to deer burying their horns, nothing that I have seen, nor nothing that I have read so far, induces me to believe that such a practice exists, and, when viewed in the proper light, the fact that so few horns being found does not at all warrant such a conclusion. If we remember that deer inhabit dense woods and thickets it is to me more surprising that so many rather than that so few are found. The shed horns being often the same color as their surroundings of dead leaves, branches and underbrush do not catch the eye quickly, and in consequence are not often discovered. But the chief reason is that they are more often shed in dense growth than in the open. My experience is that they are more frequently detached from the head by coming in contact with limbs of trees, etc., than in any other manner, and this has been manifest to me on many occasions when deer driving late in the winter. I have often seen deer shot with both horns recently torn from the head, the burr still bleeding, showing that contact with trees had caused their detachment, many days, probably, before they would otherwise have been shed. In some cases I have found one horn off and the other on, and not infrequently seen a buck started with a full head, but without horns when killed afterward within a period of an hour or so. All of which goes to prove that the bucks lose their horns under varied circumstances, more especially in unsettled countries where the deer are constantly harassed by wolves. But the greatest reason for my believing as I do is this: By far the largest proportion of horns are cast at so late a time in the season as to preclude the possibility of their being buried, owing to the frozen condition of the ground, which would in most cases necessitate the use of a pick and crow bar. Few deer shed their horns till late in December, and many not till January. This season in northern climates is generally associated with frost and snow, and were the deer ever so anxious to render homage to their departed horns by giving them a burial, how impossible it would be in the majority of cases to carry out their desires in this respect.

I killed a buck on the 22d of January last with a splendid head of horns at a time when the ground was frozen as hard as a rock, and with about two feet of snow on the level, and I fancy he would have had a hard time to bury them had he lived till he shed them, were it at a time when the ground was in the same condition. One thing more about the few horns found: Even a large single horn does not often cover a greater space than a foot square, and as there are 27,878,400 square feet in a square mile does it look at all reasonable to suppose that it would be an easy task to find the horns annually shed within such an area were the deer ever so plenty and special search was made for them. Horns are more perishable than bones, and owing to the gnawing of rodents and the effects of weather do not last long. Elk and moose horns, owing to their superior size and more lasting nature, are more frequently found than deer horns. Our close season in British Columbia is from February 1 to August 1 in each year.

New Westminster, B. C., Feb. 21. MOWITCH.

HABITS OF THE FOX—Kittanning, Pa., Mar. 1.—I see in your issue of Feb. 24 an article in regard to foxes relieving one another when hard pressed by the hounds. My experience has been the same as your correspondent from Bridgeport, W. Va. One week ago myself and two friends went out to have a chase. The dogs started a gray, and put him to earth in a few minutes. Then we started a red about eleven o'clock, and ran him until about three, when he ran into some spruce where we struck two tracks together. The one we had been running was a small one as he made quite a small track, and the one he ran into made a large track. The cunning little fellow dropped out somewhere, and the hounds went straight on after the fresh one. There was snow on the ground, and we soon discovered that we were on the track of a large fox instead of a small one. We ran the large one until dark, but never got within shooting distance of him. We had five good hounds in the chase. In regard to a pregnant fox not throwing out any scent, if your correspondent had been with myself and party on the hill about three miles north of town one day last March he would not believe any such saying. We had an old she going about five hours. She made three or four circles on a point where myself and two other parties were stationed, when we got a shot at her and killed her. The air was so full of scent that it smelled almost as strong as a skunk's, and we found in her six pups about half as large as little kittens. She had been very hard pressed and was very warm, which would account for her giving out so much scent, but that a pregnant fox will throw out scent is a fact beyond doubt.—LUTHER.

MORRISTOWN, N. J., March 10.—Ducks are beginning to come in.—E. M. Q.

INTRODUCTION OF ENGLISH RABBITS.

IN FOREST AND STREAM of March 10 the importation of some English rabbits is recorded, and some suggestions in relation to these animals may be of interest to those not familiar with them and their habits. Should their introduction to America prove a success, we are likely to be afflicted with an irreparable nuisance that may not have been anticipated by those whose enthusiasm may serve to effect much harm instead of the desired benefits. The rabbits may benefit poor people who are expert in the use of snares, and are not farmers. But they will prove more of a curse than a blessing to those who raise vegetables or practice horticulture.

The rabbits increase so rapidly in favorable localities as to fairly swarm in the fields, and I have known of the destruction of plants to the value of many pounds sterling in a single night. All the vegetable or flower gardens were inclosed by a tight fence of wire netting, high enough to prevent overleaping, and set below the surface of the ground to prevent digging under. Yet the latter mishap would sometimes occur and disaster result. As for the sport to be afforded by these rabbits, it may be better than nothing, yet a surfeit of anything soon takes away one's desire for more of the same sort. A single brief occasion devoted to rabbit shooting was enough to surfeit me. Equipped with a breech-loading gun and accompanied by two dogs and the game-keeper, who carried a big bag strapped to his shoulders, I sallied forth one afternoon. Our dogs for this occasion were a Scotch terrier and an English retriever.

The terrier started the rabbits and kept them at their best speed, while the only part taken in the sport by the retriever was to fetch the dead rabbits to the game bag. In a walk along a lane, through some birches, between two fields, I kept my gun barrels hot with quick shooting as the rabbits were driven across in front of me. For a while I enjoyed this, and kept on until so surfeited as never afterward to desire a repetition. When I congratulated my host upon his abundance of material for "carried rabbit," which was often served, he replied, "It is no cause for congratulation, I assure you. I would gladly give a guinea apiece for rabbits could I have none but dead ones here."

The so-called "rabbits" of the United States are hares, and do not burrow. But the true rabbits, such as abound in Great Britain, burrow in the ground, and I have known a clover field so spoiled by their burrows and beaten paths as to cause the attempt at cultivation to be abandoned. The wild lands are comparatively uninhabited, as the higher the cultivation the more food to attract the rabbits. Although a bird dog may be trained to give no attention to rabbits, yet if very abundant in fields or covers, their presence is a nuisance to the sportsman, while to farmers their abundance often proves a serious injury.

The sport to be had coursing hares cannot be had with rabbits, because they immediately seek their burrows. Our native hares would afford winter sport with harriers or beagles, and in Maine the northern hares are sometimes hunted with fox hounds. "Molly Cotton" is also a fair object for running harriers, and if any surplus of game be killed, "a ole ha-a" is always welcomed at the nearest darkey's cabin.

I am impelled to make this mention of rabbits as a timely hint to sportsmen who, with the best of motives and generous public spirit, in their eagerness sometimes misdirect their efforts and look forward only to possible benefits, without giving due consideration to results of a different nature, either possible or probable, and which once brought about cannot be abolished. EVERETT SMITH.

Portland, Me.

PINE GROSBEAKS—DOMESTICATION OF QUAIL—Bowmansville, Ont.—My attention has been drawn to several little items in your issue of Jan. 27, and perhaps you will allow me a trifle of space to put in a few words. The pine grosbeak seems to be a bird of a very extensive range of country. I have heard of them being seen in Manitoba, Minnesota, near Duluth, Pennsylvania, Vermont and Maine. I have myself seen them on two occasions during my bush ramblings around Quebec. They are by no means plentiful, but an occasional flock comes along. I doubt not they have also been seen by my esteemed friend Jno. Neilson, of Cap Rouge, who is one of the most ardent lovers of ornithology I know. He keeps a standing record of all birds seen, their first and last appearance in the season and any other items of interest concerning them. His record, if published, would make a valuable work of reference of the birds inhabiting or visiting northern Canada. Another item I saw was on the domestication of quail. Some years ago I knew a man in Ontario who captured a bevy of quail in a trap. These he took home and put into a small room well lighted, with the windows protected by screens of muslin to prevent the birds injuring themselves against the glass. The floor was well sanded and boxes filled with earth and young spruce trees planted in them were placed in different parts of the room as a cover for the birds. Here they lived and did well. At first they were very wild, but they soon got accustomed to persons going in and out, and at last took no notice of them, but would dust in the sand like chickens without seeming to be in any way disturbed at the presence of man. They were fed on grain of different kinds, but principally small wheat, and they had fresh water every day; at night they roosted on the floor in the most approved quail fashion—heads out, tails in. He had them for over a year when some mortality seemed to come over them and they all died in two or three days. They never bred or showed the least desire to; but the males, early in the morning, would whistle their Bob White during the spring months in as lively a manner as if they were out in the fields. They were a most interesting lot of pets and made themselves thoroughly at home.—AU SABLE.

CO-OPERATION AMONG THE BIRDS.—*Editor Forest and Stream:* The speculation on the migration of cranes and grebes induces me to send you this note. When Sir Samuel Baker was in Abyssinia looking after the sources of the Nile in that country, with an occasional hunt for grub in the interim, he one day stirred up a rival hunting party. A platoon—more correctly, a squadron—of long-legged cranes were stalking solemnly through the grass, every one of them saddled by a small fly-catcher. As the long-billed beaters tramped stolidly on, at every stop a huge grasshopper would spring up, to be instantly speared by a wicked javelin. If the crane by accident missed, down came the fly-catcher with a swoop like a falcon and gathered the stranger in, returning each to his own particular steed, between whom and its rider existed the most amicable terms. Leastwise, so "Sam" said.—JOHN PRESTON TRUE.

TAME RUFFED GROUSE, No. 2.—Springfield, O., March 12.—*Editor Forest and Stream:* In looking over your excellent paper of the 10th inst. I noticed an article written by "Mig," and dated at Cortlandt, N Y., March 3, in which he mentions the fact of having a ruffed grouse in his possession, and that it was doing well. I also have a specimen of the same family in my possession. The way I came by it is as follows: I left my office for dinner one day last fall, and upon my return opened the door to enter, when, lo! Mrs. Grouse had taken possession, and was on her wing, darting hither and thither in search of an opening to make good her escape. At first I thought, as I am something of a Nimrod, some one had captured her, and in order to get off a joke had turned her loose in my office. I at once set about securing her. I followed in hot haste as she made numerous gyrations from one side of the room to the other, and at last I caught her. But how had she made her advent into my room? On the south side was a door, the upper part of which is filled with four large panes of glass, and strange to say through one of these this bird came with a crash, inside of my office. She is now apparently happy and as tame as a chicken. She always appears delighted when fed, as is evinced by her kluck-kluck and her inimitable walk as a game bird. That the ruffed grouse can be domesticated I shall no longer doubt. Will our friend "Mig" tell us whether his bird is a male or female, and if so can we not bring them together, and thus show our brother sportsmen how this glorious bird can be domesticated and vastly increased?—NIMROD.

POUGHKEEPSIE, N. Y., March 11.—Your article from Cortlandt, N. Y., about the tame grouse answers well for the description of one I have. It was caught in the same way last fall. I have it in my store in a large cage; it feeds well on grain and hemp-seed. It will come to the front of the cage when I call it and kluck. It will also come when you show it a leaf of lettuce; also will allow you to handle it.—Yours, L. CARPENTER.

WHERE ARE THE WINTER BIRDS OF CANADA?—The following letter to the Quebec *Morning Chronicle* is from the pen of Mr. John Neilson, who has for many years been observing the habits of Canadian birds and whose experience is of great value. The question is an interesting one, and we should be glad to know whether observers in various parts of the country have noticed a similar scarcity of birds. The writer says:

Over thirty years a close observer of the coming, going and doings generally of our sedentary and migratory *fauna*, my notebooks and memoranda fail to show anything like the almost complete absence of birds during the present winter Not about the environs of the ancient capital only has this scarcity of birds been remarked but my own observations in the Eastern Townships, Cap Sante, Valcartier and other places, strengthened by corroborating evidence written from La Croche and Vermillion (St. Maurice River), from Lake Megantic and Etchemin (Beauce District), proves that this rather extraordinary exodus is general over a large portion of Eastern Quebec.

Add to the above unusual phenomena the tardiness of the crows—now eight to ten days behind their ordinary time of arrival—and we have matter sufficient to conjure up quite a pleasing variety of theories as to the why have they gone? For my part, I leave theory-making to such as possess aptitude for abstract speculations. I only quest after the positive—namely, Where have our birds gone to? Will distant observers vouchsafe information? J. N.

Dornald, Cap Rouge Road, March 9th, 1881.

P. S.—From among our deserters must be excluded the pine grosbeak (*Pinicola candensis*). This species was fairly abundant from October till January 15. They apparently commenced their northern migration February 6, the last noted being March 3.

Owls were also sufficiently common during autumn; several of the larger species (*Urand Duc*) snowy and barred, were obtained in the vicinity of Quebec. The birds principally alluded to above are pine finches, red polls, crossbeaks, chicadees, nuthatch, woodpeckers and Canada jays—all exceeding rare during the present season.

SPRING NOTES—White Plains, N. Y., March 8.—In crossing some brush this morning on a warm hill side I started a woodcock. I think we will have snipe in a week or two if this weather holds.—G. W. B.

Orange, N. J., March 11.—First flock of blackbirds seen at 8 o'clock this morning.—A. P. W.

SING SING., March 11, 1881.—*Editor Forest and Stream:* The weather has been very mild and the birds are beginning to arrive.

March 1—Saw first song sparrow; and March 2—They arrived in small flocks and are now singing merrily.

March 5—Saw flock of five robins feeding on sumach berries and seemingly having a good time.

March 6—The crows are flying over in large flocks of fifty or a hundred. One flock passed very low and I noticed what seemed to be a gull flying with them, but as they flew over me I saw it was a crow nearly all white. Are these albinos common? It is the first one I ever saw.—P. D.

White crows are certainly uncommon, but they do occur. We have never seen but one, however.

BIRDS COLLECTED AT GOOD GROUND (Shinnecock Bay), Suffolk Co., Long Island, from November 1, 1880, to March 15, 1881—

My friend, George A. Lane, shot and sent me during the past winter the following birds, viz.:

November 6.—Horned lark (*Eremophila alpestris*), blue bird (*Sialia sialis*), meadow lark (*Sturnella magna*).

December 25.—Meadow lark (*Sturnella magna*), great northern shrike (*Colluric borealis*), tree sparrow (*Spizella monticola*), snow bird (*Junco hyemalis*).

January 15.—Red bellied nuthatch (*Sitta canadensis*), yellow bird (*Chrysomitris tristis*), snow bunting (*Plectrophanes nivalis*); 28, horned lark (*Eremophila alpestris*).

February 22.—Blue jay (*Cyanura cristata*), chickadee (*Parus atricapillus*).

March 1.—Brown creeper (*Certhia familiaris*), red bellied nuthatch (*Sitta canadensis*).

March 15.—Yellow rumped warbler (*Dendroeca Coronata*).

He writes me that the horned larks, tree sparrows, snow birds, snow buntings and yellow birds were comparatively plenty, even during the most severe weather. WM. DUTCHER.

New York City.

Game Bag and Gun.

THE WINTER AND THE BIRDS.

STATISTICAL REPORT SHOWING THE EFFECT OF LAST WINTER'S WEATHER ON THE GAME IN THE STATE OF NEW JERSEY.

WE give below the most complete statistical report of the effect of the last winter's cold and snows on the game in the State of New Jersey ever compiled or published by any paper. In fact, no other State or section of this country has ever before been more carefully or thoroughly canvassed. Covering as it does the twenty-one counties of New Jersey, we have arranged them in order, beginning at the north and running down to the south. Under each county the names of the 398 places have been placed in alphabetical order, and the items sent us by our correspondents are remarkably explicit, and worthy of the attention of all those who are interested in the problem of game protection.

It would be great injustice to those who have enabled us to make this compilation if we did not extend to them our hearty thanks, and in the future, if we can be of any service to those who have courteously forwarded these items of valuable information, we trust they will not fail to call upon us.

In this issue we refrain from summarizing the canvass, as we prefer that it should speak for itself, but in our issue of March 31 the story of each section and county will be carefully presented.

SUSSEX COUNTY.

Andover.—Our swamps were dry and afforded good shelter. The quail, however, suffered more than usual. None have been found dead; but bevies that were known to exist have not been seen. Probable loss, thirty per cent. They were fed, but not systematically.

Augusta.—I can state that the severity of the winter has been very hard on the game. Snow drifts covered the quail and many flocks have been found dead. This has been the hardest winter on birds for a number of years. Seventy per cent. have perished. The farmers do not feed them.

Beaver Run.—I cannot learn that the game has been destroyed to a greater extent than in other years. A few quail have lived about the grain stacks.

Branchville.—The impression prevails here that a good many quail and partridge (ruffed grouse) have perished this winter in the snow drifts. I know of none that have been fed.

Deckertown.—The quail and partridges (ruffed grouse) have about half perished. Farmers fed and protected them all they could.

Flatbrookville.—The severe winter has been powerful on the game. Quail suffered the most. Whole flocks have been found dead. The farmers did not feed. The foxes, owls and hawks destroy more game than the sportsmen kill.

Flatbrookville.—Quail are scarcer now than they have been for many years. The farmers fed, but the winter has killed the birds.

Fredon.—There are few birds left. On the place I am living, a farm of 240 acres, I don't know of a single quail, and we generally have fifteen or twenty every winter. In a circle of six miles I have not been able to hear of but six birds alive. Pheasants (ruffed grouse) have been rare for some years.

Glenwood.—The destruction of quail by cold and snow storms this winter in northern New Jersey has been greater than ever before in my experience. Fully seventy-five per cent. of the quail left at the close of the season have perished. I have heard of two flocks—one of three and one of nine—that have wintered in barnyards. I do not think many partridges have died.

Hainesville.—I don't think there has been any material difference in the wintering of birds in this section from other winters. There has been none fed.

Hamburgh.—As nearly as I can ascertain the percentage of quail destroyed by this hard winter is at least fifty. Partridges have suffered nearly as much. I think few birds have been fed by the farmers.

Hamburgh.—So far as I can learn the destruction by the winter and other causes was at least seventy-five per cent. of our quail, and possibly fifty per cent of the ruffed grouse.

Huntsville.—The winter has been a bad one for quail and game of all kinds. It has been far more destructive than usual. About sixty per cent. of the game has perished. No farmers feed them.

Lafayette.—Very few farmers feed. There are only a few birds left The winter was very hard on them.

Lincoln.—The past winter has been very hard on birds and game generally. It is noticeably more so than usual. I think one-half of the quail and partridges have been destroyed by the snow and severe cold. The farmers and others did all they could to feed the birds that came about their buildings. Two women in this vicinity were noticable for their devotion to the birds—Mrs. C. Bennet and Miss M. Stimson.

McAfee Valley.—Many farmers fed the birds during the winter.

Middleville.—I am pained to inform you that the severity of the winter just passed has almost wiped out the quail Large flocks were left January 1, but I am fully convinced that in most cases two-thirds of them—and in most instances whole flocks—are gone. Partridges are very scarce. Rabbits as a rule got through safely.

Monroe.—There are but few quail left this spring. Farmers as a general thing do not feed the birds.

Monroe.—I have noticed particularly the scarcity of game this spring. I have found where whole flocks of quail have perished. I think two-thirds of the birds have died. Some that were fed have come through all right.

Newton.—The winter has been very hard on game, especially quail, in this county and Northern New Jersey. It has been the most severe on game that we have had since 1836-7. Ninety to ninety-five per cent. of our quail have perished. The deep snow has deprived them of all food. The farmers fed them, and up to the very severe snow storm of Feb. 1 those fed were doing well, but even these failed to return to the barn-yards after that storm, which was heavy and drifting, and beyond doubt all, or nearly all, perished. Have heard of but one surviving bevy in Sussex The few ruffed grouse left from the ravages of the fly have fared better, and I hear of some of them surviving.

Stillwater.—Birds were very scarce at the commencement of the winter. Hunters nearly cleaned them out. Cannot hear of a bird left within a radius of one mile from this place. Farmers do not seem to have found any dead ones. Cannot hear of any being fed during the winter.

Stillwater.—A large number of quail were frozen last winter The snow is off the ground, and the farmers report finding quite a number of dead birds. Partridges (ruffed grouse) were scarcer last fall than ever before, the cause being the numerous fires in the woods.

Stockholm.—One-half of the quail perished, the others would had they not been fed; not by farmers, but by hunters. The grouse have come through safe, only what has been killed by the foxes.

Tranquillity.—The snows and cold weather have caused a number of quail to perish. Some of the farmers have fed the birds. The foxes and hawks have destroyed many.

Vernon.—The quail are about two-thirds destroyed, as near as I can get at it. Certainly the most of them are dead.

Wawayanda.—The past winter has injured the game some, but I think to no serious extent. Large flocks of quail have wintered in the farmers' barn-yards, near the rye stacks.

Wykertown.—Birds have wintered in this vicinity as well as they commonly do. They are very scarce.

PASSAIC COUNTY.

Hewitt.—After the natives and the fancy shooters from the cities were through there were two or three small coveys left to be snowed under.

Lake View.—I know of but one flock of quail, they are all right—I fed them myself.

Passaic.—Some of the game has frozen to death. The decrease this year over last year is about fifty per cent. The farmers up here are so mean that they would not let the poor little things feed in their barn yards.

Ringwood.—Game of all kinds was scarce last fall, especially the partridges. The winter has been very severe No one has fed the game.

Richfield.—Very few birds in this section.

Ringwood.—Game in this section is very scarce. The winter has been so cold and the snow so deep that the little quail could not find a stalk of herbs nor a kernel of grain, so they have passed away like the morning dew. I carried grain day after day all winter long to feed a bevy of thirteen quail, and the middle of February they disappeared and I have not seen them since; I think the frost and snow have killed them. As far as I can learn, the farmers did not feed the quail.

West Milford.—No doubt the winter has been very hard on quail; probably more so than for many years past owing to the severe weather. In very few instances have quail been fed; I think it safe to say that seventy-five per cent. of these birds perished. The partridges (ruffed grouse) do much better; their loss is small.

BERGEN COUNTY.

Allendale.—The destruction of game last year was not greater than in former years. We have had no snowdrifts The foxes and hawks kill many birds. In the cover the birds feed on cedar berries. Several persons fed the game.

Cresskill.—Do not think there has been any greater destruction of birds than usual. The sportsmen have fed them. During extreme cold weather birds also followed the roads and picked from horse droppings. As snows were hard, so they could navigate, think very few perished.

Edgewater.—We are rather near to New York, and game has been pretty thoroughly exterminated The farmers do not feed them, but the farmers' cats seem to have no objection to eat them *a la* cannibal.

Englewood.—I hear of no quail left alive save a few seen early in the winter along the railroad track, where they have been fed by the employes. I think seven-tenths of the native birds must have perished.

Etna.—The effect of the cold and snow on the game this winter has been that it has left the surviving birds in a very poor condition. The destruction has not been greater than in other years, except by hawks. Birds have been fed by some farmers.

Kingsland.—Very few birds here to perish. The farmers did not feed.

Little Ferry.—All birds are very scarce here.

Maywood.—Very few birds and no effect on the game in this section.

Montvale.—We surmise that a great many quail have perished, still the fact has not come to my notice. Even should any have died under the snow or frost, unless you happened to be just there shortly after, all traces would disappear, hawks and foxes being the scavengers. No birds were fed to my knowledge

Norwood.—The winter has been very severe on all game Neither farmers nor residents feed the birds. The percentage of birds that have perished cannot be estimated.

Norwood.—I don't think the farmers or residents feed the quail. The destruction of game was much greater this winter than usual.

River Edge.—The farmers do not as a rule feed the birds. I am not aware of any destruction of game in this section.

Saddle River.—Some farmers fed the birds and the game did not suffer last winter more than usual

Schraalenburgh.—Game is scarce in this vicinity. A few quail were shot here last season. Do not think that there are fewer birds than usual.

Spring Valley.—The quail are all right, and also the rabbits.

Washington.—Quail, which were quite abundant in the early part of the winter, have been almost killed off by the deep snows. Partridges have fared much better, and as late as the last week in February I flushed several in the swamps. My opportunities for observation have been unusually good, for I have been able to get into the swamps on snow-shoes, when it would have been impossible to have stirred without them Feeding was attempted by some neighbors, but the oft recurring snow storms discouraged them, and the birds were left to their fate. Some gentlemen talk of restocking with quail this spring.

Westwood.—The cold and snows have killed a great many birds—more than in a number of winters past. I should judge one-third of the birds perished. Flocks have been found dead. A number of residents have fed.

WARREN COUNTY.

Allamuchy.—This winter has been very hard on the game. I think it is safe to say fifty per cent have perished. Some farmers have fed the quail around the stacks of grain.

Anderson.—The birds that have been saved went to the farm yards and grain stacks.

Anderson.—Fifty per cent. of the quail have perished. There was no feed except near the barracks.

Belvidere.—I saw my friend Mr. B., who has the best game farm in Warren county. He feeds the quail every winter; said he had very few left, I know of none elsewhere. A sad condition of things up here.

Belvidere.—Over fifty per cent. of the quail in this region have perished. The farmers always feed the birds, and this winter they looked after them carefully.

Bridgeville.—All the farmers say that the quail and small birds are nearly all frozen. The wood-choppers say that they find many partridges (ruffed grouse) that have been either frozen or starved to death. None, I believe, were fed.

Bridgeville.—The winter has been very severe on game—this winter more so than last. I have heard of large numbers of quail being frozen—fourteen in one lot. The same is true of the partridges. Should think that two-thirds of the birds have perished. Farmers do feed them. I have fed one flock of eight all winter. Rabbits are numerous.

Buttsville.—I do not think that the cold weather has affected the quail more this winter than is usual. I have noticed quite a large number feeding near grain stacks.

Carpentersville.—As I am somewhat of a hunter I can say the winter has been very severe on the quail. I don't think there is scarcely a quail left. The farmers have not fed the birds. There were a number of quail here last fall, but all have perished. Rabbits are plenty.

Danville.—By careful inquiry I learn that about fifty per cent. of quail have been destroyed, and other game in proportion. The winter has been very hard on the quail in this section.

Hackettstown.—The winter has been very severe. The quail has suffered very much. About seventy-five per cent. have been killed. In some cases the bevies are all gone. The farmers have not fed them any.

Hackettstown.—The snows, drifts and cold weather have been very destructive to the birds. I knew of several coveys of from twelve to twenty birds at the end of the season, and now there are only three or four birds to a bevy to be seen. Many have been found frozen since the snow went off. The loss has been greater than for many years. I think seventy-five per cent. of the birds have perished. Some farmers tried to feed and save them. There is scarcely a pheasant to be found. Rabbits have been found dead.

Hunnesburgh.—The snows and cold have had very serious effect on the birds in our section, especially quail. Whole flocks have been found smothered and frozen. From what I can gather the destruction has been much greater than in other years. Probably at least seventy-five per cent. perished about here. A very few have fed them. One small bevy has been caught and kept to turn out in spring.

Hazen.—The cold and snows have had a bad effect on game in our section. The destruction has been greater this winter than last. Some twenty to thirty per cent. have perished. But few farmers here feed them.

Hazen.—The injury to game has been serious, and the destruction greater than in other winters. About twenty-five per cent are dead. Farmers do not feed to any extent, as a general thing.

Hope.—Of quails I think half have perished, a greater proportion this year than usual. Other birds about the same as usual. I have been in the habit of feeding them.

Johnsonburgh. I can candidly say that about one-half of all kinds of game has perished. The quail have not been fed by the farmers or residents.

Johnsonburgh.—Game is very scarce here now. About one-third perished this winter. A few flocks of quail were fed by farmers.

Marksborough.—There was quite a number of birds left over from last season, but the winter has been very hard on the quail. I had a very nice flock by my wheat stack, but they have not been seen recently.

Port Murray.—We consider that fifty per cent. of the quail and other game have frozen to death. As far as we can learn several farmers have fed them.

Rocksburgh.—The snows had no effect on the game. The farmers and residents fed the birds.

Stewartsville.—Cold and snows have had no effect on the game in this section. A few coveys of birds are fed by the farmers. There were more birds last season than usual.

Stewartsville.—As far as I know the birds have wintered well here. Rabbits are plenty. I know of two coveys of quail of twelve and eighteen and a few other bunches.

Vienna. All the birds along the Pequest Valley are exterminated by the cold. The farmers were too mean to feed them.

MORRIS COUNTY.

Afton.—No destruction of birds in this section that I have learned about. Several farmers have fed a few flocks of quail.

Bartleyville.—Unable to say what percentage perished during the severe winter. It has been greater than usual. Farmers here don't take care of birds.

Berkshire Valley.—A great many quail have died through this section. I have found as high as twelve in the snow huddled together frozen. I also found a few woodcock. I am paying twenty cents apiece for live quail to let out.

Boonton.—There has not been any game, to my knowledge, killed by the weather. The quail have become tame and came close to the farmers' houses to feed. There may have been some killed by the last heavy snows.

Brookside.—The cold weather has killed most all of the birds. No one, as I know of, has fed any birds this winter.

Brookside.—The unusually cold winter has been very destructive to the game in this section. More game has perished the past winter than in many years. At least seventy-five per cent. of the birds have perished. The farmers fed early in the winter, but the extreme cold and snow finally destroyed them.

Chester.—We have lost twenty-five per cent. of our birds. The farmers tried to protect the quail.

Denville.—We have had a hard winter for our quail, but have not lost a single flock from cold or snow. One person fed a bevy of thirteen, another man fed thirteen birds, and another fed three flocks, using two bushels of buckwheat.

Dover.—The deep snows have had a most disastrous effect on the game in this vicinity. About seventy-five per cent. of the quail have perished. Partridges (ruffed grouse) have fared better. Farmers have fed.

Drakesville.—Many quail have been preserved by farmers. Some gentlemen have paid twenty-five cents apiece for quail. Do not believe the weather, though the most severe in years, killed many birds.

Gillette.—The effect of the snow has been destructive in much greater proportion than in other years. Nearly one-half the birds are dead. Some farmers did feed, but it was not generally done.

Green Village.—I have not heard of any game that has perished.

Hanover.—The cold and snows have killed a great deal of the game about here. The birds were fed by farmers.

Hopatcong.—The cold weather had more effect on the hunters than on the birds. What game there is here seems to have wintered well.

Littleton.—The farmers fed some, but the cold killed half of the quail.

McCainsville.—The quail have been fed. I do not think the destruction of birds has been greater than in other years.

Madison.—There seemed to be plenty of quail left January 1. I know of at least fifteen coveys of from three to ten each. I think it safe to say that at least two-thirds of these birds perished from the cold and snow, and the remainder are left in a very weak condition. Many will be killed by our cold spring rains, by hawks, etc. I have a fine lot of good strong birds that I shall turn out by pairs when the weather will admit. Birds were fed and protected by sportsmen, who are in many cases farmers.

Mendham. I should say fifty per cent. of the quail have perished. Partridges (ruffed grouse) have fared better. A great many farmers fed birds, and I know of several parties (myself included) who have a pair of birds to liberate soon.

Mendham.—The most severe winter on game that we have had in ten years. It has destroyed nearly all the quail, but not many partridges. The percentage of birds destroyed has been at least seventy-five per cent. Very few farmers have fed the game.

Middle Valley.—The farmers don't feed the birds, but they are down on sportsmen. A number of birds have not perished. I know of several coveys; saw a flock this morning (March 15).

Millington.—There are but few game birds in this section. They have been fed grain and have wintered well as usual.

Millington.—The stock of game near me has been reduced fifty per cent. One flock of a dozen quail saved by wood-chopper finding them.

Millington.—The winter has been very severe on quail and other game. Whole bevies of quail have been found dead. Game of late years has been scarce. Fully forty per cent. of game was killed.

Montville.—I do not think the destruction of game has been greater than in other years. I have had one flock of twenty quail under my notice all winter. They were alive two weeks ago (March 17).

Morris Plains.—So far as I have been able to learn, the game has not suffered, aside from their being weakened by the cold and lack of food. The farmers, as a rule, do not feed.

Morristown.—Birds have wintered better than many expected. I have heard of but two being frozen. A number of birds were fed. Undoubtedly some have perished, but in my belief one-tenth only suffered. The grouse are still all right.

Morristown.—A large number of birds have perished. The loss has been much greater than usual The farmers as a general thing fed the birds.

Mount Olive.—There have been no more dead birds than in other years. I have recently seen one flock which wintered under a grain stack.

Mount Olive.—There are a few quail and plenty of rabbits left.

Naughrightville.—More birds have perished on account of the severity of the winter than ever before to my knowledge. I think that seventy-five per cent. of the birds have perished.

Naughrightville.—This has been a very severe winter with game of all kinds. Quail are all dead. Have never known a winter in which the destruction has been so great.

Newfoundland.—Farmers tell me that where in the fall they saw quail, now they cannot see a track; yet there are some quail left. Farmers have tried to feed them, but the deep snow covers them. I would say about seventy-five per cent. have been lost.

Newfoundland.—Perhaps fifty per cent. of the birds have perished. A number of farmers have kept small flocks of quail on their land this winter.

Parsippany.—I have no definite information as to how the quail got through the winter, but some must have perished. Some of us have taken the precaution to feed and protect several large bevies of quail, and have thus brought them safely through the winter.

Parsippany.—In this section there has been little, if any, destruction of quail. In half a dozen places the birds have been fed at different times.

Pequanac.—The winter had the effect of destroying the game, more having been killed than in previous winters Forty per cent. of the birds died. A very few farmers fed them.

Pine Brook.—Almost half the game has been killed. Greater destruction to game than for many years.

Pine Brook.—The game in general has suffered a great deal, especially quail and rabbits. A few quail would feed around the farm yards.

Pine Brook.—The quail in my vicinity have not been injured a particle by the severity of the winter. The four or five bevies in my neighborhood have a goodly number left over for seed, and in my humble opinion it is the infernal traps and not the winters with us that cause the diminution of quail and grouse. There has been no crust this winter, and a crust, though acceptable to a hungry man, to a hungry quail is certain death.

Pleasant Grove.—The winter has been unusually severe on the birds, and the destruction greater than in other years. Nearly all have perished; at least two-thirds. Many small flocks have been fed. Feed, in some instances, was carried out to the roosting places.

Pompton Plains.—The destruction of birds this winter has been greater in this locality than in many years previous. I have fed four flocks or parts of flocks, and twenty-two birds are now living as a reward for my labor. I saw them last week all well and strong. I have found a great many birds dead in the snow. There are only about one-eighth of the birds left now that there were at the end of the season.

Rockaway.—The quail have suffered very much from cold and snows; very few survivors. Some of our farmers and residents have fed them, and have succeeded in wintering a few, in some cases only to have them killed by the pot-hunters in this section. They kill all kinds of game at all seasons. The partridges have been almost exterminated.

Rockaway.—Brush houses were made for the quail to feed and hide in. When the snow was deep we went and fed the birds. They would run out at our approach, and as soon as the grain was thrown in they would return and feed.

Rustic.—I consider the quail crop a total loss. Have tried all winter to trap some, and had others at it, but failed. I offered fifty cents apiece and could not get one. Have heard of dead ones being found about here. A booby-owl dropped dead here from cold and starvation, and two Acadian owls were killed and found to be on the verge of starvation—all rare birds here. No winter has approached this in severity in my time—forty years.

Schooley's Mountain.—Destruction of birds considerable; estimated from one-half to three-quarters. Some quail were fed.

Suckasunny.—The birds are doing pretty well under the circumstances. Rabbits are plenty.

Suckasunny.—Quail are doing well under the circumstances. Many farmers have kept a bevy about their buildings feeding them. If the hatching season prove favorable there will be a fair amount of birds next season. Many of my acquaintances have been feeding them on the hillsides and in the swamps.

Suckasunny.—Quail have undoubtedly suffered this winter. I know of a few flocks that have wintered through, but can find no trace of several others. The birds were fed by a few parties. Hawks are unusually plenty.

Whippany.—The winter was very severe on the birds. I think thirty per cent. perished from cold and hawks. The birds were fed.

Whippany.—The farmers fed the quail. I do not think any perished.

ESSEX COUNTY.

Belleville.—There were quite a number of quail left in this section at the close of the last season, but I fear the severe weather of the past winter has completely destroyed them, as the writer and a friend after diligent search has been unable to find any trace of their existence.

Bloomfield.—We have no game of any kind left in this vicinity.

Brookdale.—The winter was very severe on game in this section. Birds are protected by cedars here. One farmer was feeding twenty quail and sixteen out of the lot perished. Some few birds and a good many rabbits were caught and kept over.

Caldwell.—One-third of the quail was winter-killed. Several broods were fed and kept over. Partridges (ruffed grouse) are quite plenty for this section.

Livingston.—Game has suffered severely; quail especially have all died.

Montclair.—As far as I can learn the quail and grouse of this section have been nearly all destroyed. Quail suffered from the intense cold and heavy snows, a number having been found frozen. Can only learn of two parties feeding quail this winter. Grouse are scarce, having been driven away by the fires of the fall of 1879 and spring of 1880; prior to that they were pretty plenty.

Montclair.—Several farmers have fed quail. One party fed a covey of nine, and another party fed fifteen birds. I have seen several partridges (ruffed grouse) that were frozen to death.

Roseland.—I have noticed some of our residents feeding the birds. Not noticed the loss more than usual.

South Orange.—I have not been able to find out much about the effects of this severe winter on the quail. Several have been found frozen and starved to death. In one case five quail and two ruffed grouse were found dead side by side. Some of our sportsmen owning large places have purchased quail and will let them out in the spring. I have heard of no one feeding wild quail.

Verona.—Quail are not abundant here. Only six bevys of birds within a radius of two miles. The snows did not drift, and the birds could run on the crust. Not many hunters stop here, as they go further in the interior. Pheasants (ruffed grouse) can be found alive.

HUDSON COUNTY.

Van Buskirk.—Meadow larks are the only birds about here; they have disappeared.

HUNTERDON COUNTY.

Annandale.—One farmer reports he saw a flock of quail of eighteen within a week; another saw six since the last big snow. With us the birds suffer from owls, hawks and little gray foxes. One farmer says he had three flocks killed by foxes last Autumn. No one feeds.

Anthony.—About ninety per cent. of the quail has perished. All the birds that could be found were fed.

Anthony.—Seventy-five per cent. of the birds have been frozen to death.

Bethlehem.—The severe cold weather and the snows have caused the quail to perish. Nine-tenths of the birds have disappeared since January 1. The farmers and sportsmen have not fed to my knowledge.

Bloomsburg.—The quail have been cared for by the farmers, and I can safely say that not five per cent. have perished.

Bloomsburg.—The only game left here were rabbits after the shooting season closed. Cold weather does not injure them. Quail and partridges are exterminated; shot guns are too cheap.

Bloomsburg.—The game in this section has suffered a little. During the extreme cold weather and while the feeding-grounds were covered with snow myself and two or three other lovers of quail shooting selected each a bevy of quail, which we looked after and fed every two days.

Cherryville.—There are plenty of rabbits left and quite some quail and more grouse than in years. I think if each section would take more pains to feed and care for birds there would be more. It would be a good idea to get birds and stock the the county with quail.

Clinton.—Fully one-half the game has been destroyed. Farmers fed the birds whenever they could find them.

Copper Hill.—I know of no farmers that fed the game. I think some quail perished during the winter.

Flemington.—Quite a number of birds have passed through the winter safely. Some flocks were fed.

Flemington.—The winter has not seemed to kill many of the birds in this section as they have lived around stacks and barracks, and some have been fed by farmers.

Lambertville.—There were plenty of quail left for breeding at the end of the season, but now I do not believe there is but one left in this section. I have killed the last 17 years from 276 to 659 in a season, and a good many pheasants (ruffed grouse), but I think there will not be many killed next fall.

Lambertville.—Most of the game birds left last fall. Destruction no greater seemingly than other years. Hawks have been more destructive than the winter. Small percentage have perished. Very few farmers have fed birds, as there are a very few birds to feed. We know of five bunches around here, five to ten in a bunch.

Lebanon.—The weather has had no effect on any birds in this section, except that I hear of some quail being covered by the snow drifts.

Lebanon.—The game is not injured about here.

Little York.—I am sorry to state, from experience, that the

destruction of game has been very great in this section. At least eighty per cent. of the quail have perished in our first snowdrift. There have been bevies found frozen since the snow has gone off, sitting just as they went to roost. Only two quail have been found since the drift, and as they were trapped they are all right. Plenty of rabbits. Pheasants (ruffed grouse) very scarce. I hope there will be some action taken to stock us up again.

Kingwood.—I have no doubt but that the severe weather destroyed a great many game birds; but what percentage it would be hard to tell—perhaps one-half. I have not heard of any farmers feeding the birds.

Mount Pleasant.—The cold weather has caused many kinds of birds to perish, especially quail. I do not think the farmers have fed them in this vicinity. The destruction has been greater than in former years.

Mount Pleasant.—The farmers do not generally feed the birds in this section. The loss has been great r than usual. At least forty per cent. are dead.

New Germantown.—The cold winter has destroyed quite a number of rabbits. Some of the farmers fed some of the quail.

Norton.—About half the game perished last winter. The farmers did not feed.

Oakdale.—I am satisfied a great many quail have perished. I did not feed them for a while, but they have not been seen since the snows.

Oak Grove.—The winter has been very hard on game of all kinds. Some residents have fed them.

Pattenburgh.—The farmers of this section do their threshing at intervals during the winter from barracks and stacks of grain; this affords the birds food. I doubt if many were destroyed.

Perryville.—The destruction of birds by the winter has been very great; probably fifty per cent or more have perished. A very few farmers have fed.

Raven Rock.—The heavy snows and extreme cold weather has about exterminated the game in this locality. The farmers and others in this locality were willing to feed the quail, but it was almost impossible to find them. There may be a few left; if so, very few.

Readington.—The quail are all destroyed. I can only find one survivor out of two coveys of six each. These coveys were fed and cared for by farmers' sons through the snow and cold, but the weather proved too destructive

Readington.—I consider the game almost entirely destroyed. Have been watching the condition of two coveys of six each. One of these had the advantage of a wheat stack and were doing well up to about six weeks ago, since when I have been unable to find them. They have probably perished. The other covey had the shelter of an old hovel in a ragweed field. I employed a person to entice them to the hovel by trails of grain, and had the satisfaction a few days later of finding the whole six under the hovel. Soon after came a blustering snow storm, and since then I have found but one survivor. He can be found about the hovel almost any day. The farmers' sons have fed the birds very generally; but I fear that but few are left.

Readington.—It has been a remarkably hard winter on quail. There were seven birds by my place; I fed them, but they are all dead but one. No one else cared for them in this section to my knowledge.

Reaville.—We know of no further destruction of birds from cold weather last winter than from previous ones. We have seen birds since the snows. No farmers feed.

Tumble.—Eighty per cent. of the quail have perished.

SOMERSET COUNTY.

Basking Ridge.—It has been a very hard winter on game. It is nearly all dead. A few birds have been fed.

Bernardsville.—The hard winter has not killed all the quails. Some have been fed by farmers and sportsmen. Grouse are plenty. More game has been killed by hawks than by severe weather.

Blawenburgh.—More quail have been killed this winter than there have been in ten years. A few small coveys have been saved that lived by the stack yards.

Hillsborough.—Game is very scarce about here, but do not see that the destruction has been greater than in other years.

Martinsville.—I think most of the birds in this section have perished. They were not fed by the farmers.

Montgomery.—The snow has been very deep here, and killed a great many quail. Whole flocks have been found under the snow. There have been more killed this winter than in many years past. We took care of a few, but the snow was too deep.

Neshanic.—I do not think that any birds have been winter-killed or starved to death, as they have fed on the seeds of the high weeds; but foxes, hawks, owls and weasels have killed nearly half of the birds and two-thirds of the rabbits. Nearly all the pheasants have been killed by foxes. Farmers have not fed the birds. I have given three bushels and a half of buckwheat to one flock which originally numbered twenty-two, and of which eighteen are now left.

Peapack.—Two-thirds of the quail and other game has been destroyed. No one, to my knowledge, has tried to feed the birds.

Plainville.—The cold and snow this winter have destroyed considerable of the game. Of quail, at least one-half; of pheasants, one-third. Rabbits seem to be very scarce here, but were plenty last fall. More birds have been winter-killed than for several years. I know, because I hunt a great deal.

Raritan.—No birds of any account have perished in consequence of the cold weather. Farmers feed the birds.

Rocky Hill.—Birds have not frozen in this section in very large quantities. Several of the farmers, who are sportsmen, fed and cared for them in many ways. One gentleman, who takes great interest in sport, has carried over a whole bevy, and thinks they will breed in his woodland this spring. One overseer has caught and wintered birds to stock the grounds.

Somerville.—From the best information I can gain the cold and snows have destroyed a large part of the game in this section; what percentage I cannot state, but certainly a much larger one than usual. In a few cases the birds have been fed by farmers and others, and in that way kept from starving. They have also been driven to farmyards and exposed places, and have in that way suffered severely from hawks.

South Branch.—The cold and snow have had a very bad effect on the birds. Very much afraid they are all dead. The destruction has been greater than in five years. What were not shot have frozen to death. The farmers very seldom feed them.

UNION COUNTY.

Cranford.—The destruction of game has been far greater this winter than usual. Should think seventy-five per cent. of the quail have been destroyed by cold, snows and hawks. I know of one flock of quail having been fed with abundance of food, and they were in good shelter, and but three remain out of nine; and I think, therefore, that all must have perished if not well fed and were not in good cover.

Cranford.—What little game was left in our section has been pretty well frozen out during the past winter. The heavy storms of sleet and hail have so effectually covered up everything that the quail have been literally starved to death. At least seventy-five per cent. have perished. Think the farmers, in some cases, fed the birds, but not generally.

Plainfield.—Have heard of no quail or grouse having frozen to death in this section. They are very scarce here. As a rule, where there has been a covey of quail the farmers have looked after them. I have heard of several cases of this kind.

Scotch Plains.—I do think the cold weather has affected the game a great deal. There have been some quail seen since the snow disappeared. There were quite a number when the season closed.

Union.—We have very few quail to winter, and at this date, March 18, I do not know of a bird that has survived.

MIDDLESEX COUNTY.

Cranbury.—There are several small bevies of quail in our neighborhood that have been fed by the farmers. Those that were not fed perished. There has been a great many found dead since the snow went off. Woodcock have been around about one week (March 15).

Cranbury.—This winter did for the quail. Quite a number have been frozen to death. A number have been fed by farmers. The destruction has been much greater than usual.

Dean's.—The quail suffered very much around here. I don't know of but one in this neighborhood, and I fed him all winter. I think the rabbits and partridges (ruffed grouse) have wintered all right.

Dunellen.—There has been a number of flocks of quail frozen and starved. I do not know of but a few birds being fed. Nearly one-half have perished.

Iselin.—The coldest winter for many years. The birds died for want of something to eat. Farmers are too mean to feed their stock, let alone quail.

Metuchin.—A few quail have been frozen to death. Many farmers feed quail in this section.

Monmouth Junction.—It is the general opinion around here that not much game has survived this winter. Numbers of quail and rabbits have been found dead. Few people feed the game.

Metuchin.—Several flocks have been fed here. Birds are scarce, the winter was hard on the game.

Old Bridge.—The quail have nearly all perished; they were not fed.

Sayreville.—The severe winter has had some effect on the birds in this place. I know of no one that fed them.

South Amboy.—Although the past winter has been an unusually severe one for the game, especially the quail, they have not been entirely exterminated, at least half having survived. Ruffed grouse have been quite numerous all winter, and have not apparently suffered much. The farmers did not, as far as I know, feed the quail.

South Amboy.—No care was taken of the quail by residents. The winter was very destructive, one-third of the birds must have perished.

Woodbridge.—The cold weather has almost destroyed the birds in this township. I have made extended inquiry of persons living on the farms, but only two small bevies have been seen since the snows. The destruction has been greater since the years 1856 and '57 when most of the game was killed. The two bevies I speak of were fed by farmers.

MERCER COUNTY.

Dutch Neck.—It is hard to tell the percentage of game destroyed. Rabbits got along as well as usual, but quail and other birds have frozen and perished. There are quite a good many birds left.

Edinburgh.—I think the birds are hurt by the winter; one-half have been killed.

Edinburgh.—Some quail have been seen since the snow. Farmers fed them. Not over fifty per cent. perished.

Ewingville.—Fully fifty per cent. of the birds have perished, if not more; in some localities they have all perished. The birds have not been properly fed during the winter. Many quail have been killed by the snows.

Hamilton Square.—Winter was very severe. Very few birds fed and a great loss of game in this vicinity, certainly more than one-half.

Hightstown.—I have not seen a quail since the heavy fall of snow. I have heard of whole flocks that have been found since the snow melted that were frozen to death. Three-fourths of the quail perished last winter.

Hightstown.—We had but few quail in this vicinity last Fall and we hear of none since the snow. Dead birds have been found under the drifts. Without doubt fifty per cent. of the birds and rabbits perished by the snow.

Lawrence Station.—One-half of the birds have been frozen or starved. The farmers were very negligent in regard to feeding them, many of them considering game of no consequence.

Lawrenceville.—In reference to game matters in this locality, I would say that almost all our quail are destroyed. Some of the farmers have fed the birds. I think we will import birds next spring. Rabbits are quite numerous. Hawks do great damage to our quail.

Pennington.—The winter has been severe on the quail. The destruction has been greater than in other years. Do not know of any farmer that fed the birds. The quail that the snow did not kill went to the stacks and the hawks destroyed them. One farmer did not let any one kill birds last fall. He says that he has not seen one since the snows.

Princeton.—The quail of this county have been preserved in two ways—the one by being cared for by the farmers, the other by being left unmolested by the hawks. The hawks left us very early in the season, presumably because they could find nothing to eat on account of the depth of the snow. The birds have kept near the farm-houses and been cared for. Few birds were killed after the cold weather commenced.

Princeton.—Have seen no game this winter. The quail perished with the snow and cold weather. Heard of one flock of seventeen quail, near Princeton Junction, which were kept over by the man feeding them from his wheat stack.

Princeton Junction.—Since the snow has disappeared it has been discovered that hundreds of quail and other birds have perished. Whole flocks have been found huddled together dead.

Robbinsville.—There has been about fifty per cent. of the game killed off. Some of the farmers fed the game.

Yardville.—I fear the weather has proved destructive to most of the quail. I should think fifty per cent. have perished. Farmers do not feed as a general thing.

Titusville.—The quail mostly perished during the first snow storm. I think we have about one out of twelve left for breeders. Farmers do not feed them.

Windsor.—Most of the birds have frozen to death. Birds were fed when we could find them.

MONMOUTH COUNTY.

Allair.—My opinion of the snow and cold in this vicinity is that I think it is within bounds to say eight out of every ten quail have perished with cold and hunger. We, the sportsmen, fed all we could find, but the snow was so deep we could not find the birds for several days after it fell. We have not experienced as hard a winter for thirty years, and then the snow was not so deep as this. I have one bevy of twenty-three that is fed every day.

Clarksburgh.—The last winter has been so severe on game the percentage of loss must be fully fifty per cent. Farmers have paid no attention to feeding game.

Clarksburgh.—The game around here has suffered some, but I think there will be enough left to have fair shooting next fall. Grouse and rabbits are all right. I shall turn out 100 quail in the spring which, with what are left over, will make fair shooting in this township next fall if nothing happens.

Cream Ridge.—More birds have died this winter from extreme cold than for many years. I think four-fifths of the quail left last fall have perished. Some sportsmen-farmers have fed a few.

Deal.—The cold and snows last winter have killed about two-thirds of the quail and rabbits. The winter has done more damage to game than our gunners know of for many years. Four or five farmers fed the quail.

Deal Beach.—As far as I can learn the winter has been very severe on game, especially quail, and I have heard of no one feeding them to preserve them. One old gunner informs me he has not seen a quail or a meadow lark this season.

Ellisdale.—The snows and severe winter have killed pretty generally all the birds, what few that have survived have been fed. I do not think that we have one bird where we had five or six.

Fair Haven.—I found four remnants of bevies to-day in a walk of two miles. The flocks averaged seven birds each. This is as good as usual.

Freehold.—Fully ninety per cent. of the game in this section has been destroyed by the severe winter. Far more perished than for many years. In a few cases attempts have been made to feed the quail. The supply of food in the woods and fields has been almost nothing. Many birds have been found starved to death.

Freehold.—I have heard from various sources of the great destruction of game by the severity of the weather. A taxidermist here has had an unusual amount of work to do lately, because, as he has said, "So many birds have been starved out." A number of rare (for this locality) birds have been shot near farm houses where they came for food. Over six feet of snow fell here during the winter, and good sleighing lasted from Christmas to February 9. This will show the condition of food supply.

Hamilton.—I believe that fifty per cent. or one-half of all the game birds have perished. Of quail I believe that ninety per cent. have been destroyed.

Hazlet.—In this section the quail are not entirely destroyed, but at least seventy-five per cent. are. I think the first heavy fall of snow did the damage, for I had located seven coveys before the snows, ranging from four to twenty-one, of which I could find but one covey of fifteen after the snows. Of these I succeeded in saving twelve by constant feeding and attention. I know of but three other instances of their being fed by farmers.

Highlands.—Only in one instance have I heard of quail being bred here. They say the birds have died from cold.

Holmdel.—Have heard of no perished birds. Have heard of a number of quail flocks harboring about barns or out buildings. Have heard of but few birds being fed by farmers.

Imlaystown.—Two of our sportsmen gave the quail here a good dose of breech-loader's pills in the fall, and fed the balance all winter.

Keyport.—There is very little game in this section. Have not heard of any destruction among birds or other game. The country back of this town is very thinly settled, and I should think that the few game birds would find all they wanted to eat from the numerous barn yards with which the country abounds.

Keyport.—From what I can learn the game has not suffered as much as I expected it would. Hawks have done much harm. I know of one bevy of twenty-three from which they have taken ten, and another of nine from which several have been taken. Superintendent Walling, of your city, has sent down 108 Virginia birds to be turned out in the spring. They are in good order and will help us. If all lovers of the sport would do the same we would have plenty of game.

Keyport.—There are plenty of quail left about Clarksburg and Monmouth Junction. They are not all dead in Raritan, Holmdel, Middletown and Matteawan townships. Over 300 birds have been put down this spring. We were obliged to turn them down at once as they had begun to die owing to vermin.

Leonardville.—As far as my knowledge goes there is not one bird left to tell the tale. I have seen nothing but dead ones since the snows fell.

Leonardville.—The winter has destroyed nearly all the game, there may be five or six quail left. Birds are scarce here, as they are killed off very close every season by the hunters. The farmers could not feed, as the birds were snowed under. Several have been found dead after the melting of the snow.

Little Silver.—The game seems to have suffered to some extent. Some quail have been found dead.

Little Silver.—Game in this section is not very plenty, mostly rabbits and quail. They seem to be alive, none having been found dead.

Long Branch.—The effect of the weather has been disastrous to the game, and the destruction has been noticeably greater than in other years. Not less than seventy-five per cent. of the birds have perished. Birds have not been fed to any extent.

Manalapan.—Great many birds have perished this winter from the effects of cold and snow. Some farmers have fed birds, but not many of them. Cannot tell what percentage have perished.

Matawan.—We had more quail left when the season was up this year than we had for years before. The heavy snows and severe winter have nearly exterminated them. I should think that ninety per cent. have been destroyed. I know of a number of cases where farmers and gunners have fed and tried to care for them, but in every instance they have either frozen or been killed by hawks.

Morganville.—There were a large number of birds left over at the expiration of the gunning season. I think when it comes time for them to mate and separate from the flocks there will be some. Several lots were fed.

New Bedford.—Seventy-five per cent. of our quail are dead. The only birds living are those fed by the farmers. I know of a great many rabbits that have been found dead.

Ocean Beach.—The cold weather and snow have killed most all of the game.

Oceanic.—Quail all frozen. From all accounts there will be very few birds this spring. The farmers fed and took care of all they could find. Meadow larks all frozen and starved out.

Perrineville.—At the least ninety per cent. of the quail have perished. In consequence of the extremely cold weather the birds have been exterminated in our immediate neighborhood.

Port Monmouth.—From accounts and my own knowledge the quail have suffered severely. There were two large flocks about my place early in January, and a month later there were but two birds to be seen. Now, none to be seen, nor any tracks on the snow. I think nearly 100 per cent. perished. Small birds died in great numbers. We had fifty-one days of sleighing.

Port Monmouth.—The quail and ruffed grouse have suffered in our section. I think fifty per cent. of the quail have perished, also meadow larks. I think the other game is all right. Several flocks have been fed.

Red Bank.—Some birds left for seed. Farmers have fed them.

Shrewsbury.—From what I am able to learn quail have fared badly. Only the few have survived that have ventured to take shelter near the farm buildings and fed with the poultry.

Southard.—The cold weather and heavy snows have killed almost all the quail; only nine birds left, and they were fed by the farmers. We have not had so many birds killed in years. The doves are dead and the rabbits have suffered considerably.

Spring Lake.—The cold has done greater damage than for five years. An estimate of fifty per cent. of the birds have perished.

Spring Lake.—About fifty per cent. of the quail have perished. They have had but little care from any one.

Waton Falls.—Quail have suffered to a great extent; about one-half have perished. Partridge about one-fourth. We cannot notice any decrease in rabbits. Small birds have also suffered very much.

Turkey.—The effect of the snow and cold weather has been very severe on the game. Most all the quail have been killed. Hardly any escaped. There have been a few kept over by being fed. At least seventy-five per cent. are dead.

Waterford.—I am sorry to state that the winter has worked great destruction among the quail. There seemed to be more than usual at the close of the season, but on account of the depth of the snow it was impossible to hunt them to feed. I have heard of but few bevies being fed. Fully four-fifths have been killed.

BURLINGTON COUNTY.

Ateon.—One half of the quail have perished. We have fed them as well as we could. The severe winter has had a very disastrous effect upon the quail.

Beverly.—The cold and snow last winter have had a very damaging effect on the game in this section. The destruction of game has been greater than in any one winter for the past ten years. Whole bevies have been snowed under. Seventy-five per cent. would hardly cover the loss. As the birds were caught in the early snowdrifts, the farmers had but few opportunities to feed.

Beverly.—There is but little game in our vicinity to be destroyed. Sorry I cannot give you any information.

Bordentown.—The past winter has been very severe on what game we have around here, and what was left at the commencement of the winter, I am afraid, has been utterly destroyed. At least the farmers say that since the snow has disappeared they have not seen a quail. We have no grouse, at least not in this neighborhood. The prevailing opinion is that very few if any quail are left alive, as numbers of dead ones have been found starved to death.

Bridgeborough.—Last winter was severe on the game. The destruction of quail has been noticeably greater than in past years. The farmers have fed in a very few instances.

Burlington.—There are very few quail left over in this neighborhood. Have heard of one farmer feeding eleven birds all winter. I believe at least 75 per cent. of the birds perished. The winter was noticeably severe on rabbits; a great many have been found frozen and starved to death.

Burlington.—I find that the quail have been almost exterminated this winter in this neighborhood. But toward the Pines they have fared better, owing to the quantity of unhusked corn, and the cover afforded by the Pines protected them from the hawks. The farmers are beginning to feed the birds, as many of them own breech-loaders and are good shots.

Crosswicks.—From what I can learn the quail have suffered a great deal in some localities. Many were raised around here last summer, but most of them left here early in the autumn for the Jersey Pines and the seacoast. Farmers here (with few exceptions) are grangers and care nothing for the birds.

Crosswicks.—I have known of but one covey of quail being saved. Dozens of flocks perished. One farmer had five coveys; they were all frozen. Other game is all right.

Delanco.—There were a few of the birds fed. All the birds that were left to seek their own food and shelter froze. A portion of the quail that was fed perished.

Delanco.—There is scarcely any birds in this section. A recruit will be needed. There has been great destruction among game.

Fellowship.—The snow and cold have caused many quail to perish; I have not seen or heard of any this spring. The farmers did not feed the birds. The way the young fruit trees look leads me to think the rabbits must have fed themselves.

Fellowship.—It is the common belief that the quail were generally killed by the snow. I know of none that were fed.

Fieldsborough.—This has been a very hard winter on game. Hundreds of quail and grouse have starved to death. It will be fully five years before we have any birds here. The farmers did all in their power to save the birds from death There seem to be plenty of rabbits.

Florence.—We occasionally hear of flocks or parts of flocks of quail being frozen. One farmer fed a flock all winter.

Hainesport.—Fully two-thirds of the quail perished last winter. There were a few flocks fed. I think most of the rabbits have survived. Other winters seldom had any effect on the game.

Hainesport.—There are fewer birds left in our section than ever before. Fifty per cent. must have perished. A few flocks of quail have been fed by the farmers.

Hartford.—I think that at least 75 per cent. of the quail perished. I am only acquainted with a few instances where birds were fed.

Indian Mills.—Game in this section has perished very much. Quail, 75 per cent.; pheasants, 50 per cent.; rabbits, 25 per cent. About one out of every four farmers have fed.

Jobstown.—What with heavy snows and hawks the birds have had a hard time this winter. I hear of many being found frozen, particularly the birds hatched late in the season. On one farm of 1,500 acres we employ a gamekeeper and assistant to kill hawks, of which we have already destroyed a large number, and to feed daily the quail on our farms and our neighbors'. Many of the flocks left last fall have thus been preserved.

Juliustown.—The extreme cold weather has been very severe on the quail. Many have been frozen to death. Some few were fed.

Lower Bank.—Quail have been found dead by the flocks. The effect of the cold has been very severe. Residents have tried to feed the game.

Lumberton.—It is said by the public of this neighborhood that 60 per cent. of the game has perished on account of the cold weather.

Marlton.—One-half of the game has died in consequence of the cold. The partridge (quail?) have suffered the most.

Marlton.—The destruction of game has been greater than for years.

Medford.—The winter was unusually severe on the game. Some of the farmers fed the birds.

Moorestown.—Many birds have been fed regularly by farmers. I think the destruction has been greater than the average. Not so many are destroyed by cold as by want of of food and exposure to hawks. Should judge one-fourth have perished.

Moorestown.—I am sorry to say that the heavy snows have almost exterminated the quail. I know of but one covey of eight or nine left in this section. A few farmers take an interest in preserving game, generally those who are sportsmen.

New Lisbon.—Many of the quail and pheasants (ruffed grouse) have been destroyed, so said, by the severe winter. Our principal gunner says there is plenty of seed left, for he has seen birds.

Pemberton.—We find our quail stock diminished at least 80 per cent. more than in the last twenty years, many, very many coveys being found frozen on their roosts, under the snow, others dead on the crust. Quite a number of birds were fed by the farmers, some few going through. Hawks and mink killed some. We don't feel encouraged to train our pups. We had more quail last December than usual.

Pointville.—I have fed twenty-seven quail all winter, and others have done their best to save the birds.

Riverton.—The farmers fed the game birds in this locality; no birds, to the best of my knowledge, have perished.

Shamong.—Eight out of ten quail have frozen to death. One person fed two flocks, but the last storm killed them all. Pheasants (ruffed grouse) are most all destroyed.

Tykesville.—One-third of the birds have died. Several persons fed the quail all winter.

Tuckerton.—Though we have had a very hard winter game has not suffered, greatly owing to the pains the farmers have taken in feeding and caring for them. We shall have good gunning the coming season. The percentage that perished was small.

Tuckerton.—Long Beach is on an island; we have no game birds here.

Wading River.—I should say eight out of ten quail are dead about here, and in the Pines nine. Pheasants (ruffed grouse) have fared better.

OCEAN COUNTY.

Bamber.—This is quite a small place in the Pines; but previous to the snow we had several fine flocks of quail; since then can hear of only six birds being seen. About thirty per cent. of the rabbits have been killed. The grouse have not been destroyed, as they feed on the cedar buds.

Cassville.—Very few birds have been left alive. Rabbits and squirrels very scarce. Very few quail were fed. The ruffed grouse have done much better than other game.

Collier's Mill.—The cold winter has killed all the quail and a large amount of rabbits, and much of all other game.

Collier's Mill.—There are no quail left, although we had plenty until the deep snows. Rabbits froze in their beds in great numbers. Worst winter for years.

Forked River.—The heavy snow storm on December 28 covered the ground for two months. Fifty per cent. of the birds perished during that time. Few persons fed.

Hornerstown.—The cold and snow of the past winter have almost totally destroyed the birds in this section of the country. The destruction has been decidedly greater than in former years. I should think ninety per cent. of the birds have perished. Not much interest was displayed by the sportsmen and farmers. I went out twice—once when the first heavy snow fell—and found traces of birds; but after the next snow I could find no more birds. One bevy had ten birds in it and at the close of the season, only two were left.

Island Heights.—The game in this section is about the same as usual.

Manahawkin.—The cold and snow have had more effect on game this winter than before. The percentage of birds destroyed must be large. Fully fifty per cent. of quail, larks and doves have perished. A few persons have fed the birds.

Staffordville.—The quail have suffered more than any other birds. Over one half have died from the cold and snows. Some of the farmers did feed them with grain. Pheasants have fared about the same. Rabbits suffered some. Nine-tenths of the meadow larks are dead.

Toms River.—Quail are very scarce about here this spring. On the place where I live, and where they were quite plenty last spring, I have not seen one since the snow storms. Plenty of rye has been sown for their benefit if they were there to eat it. On a large farm of mine, three miles from here, there are twenty-five or thirty quail that have wintered all right, but great care has been taken to feed them. This is as the case stands on my own grounds. I hear of quite a number of farmers who fed the quail, but probably a majority of them thought they had enough to do to feed themselves. There will be a few birds left for seed.

Toms River.—Considering the severity of the weather quail have wintered remarkably well in this section. Have heard a few instances of their being found frozen, but the majority have lived through. A few sportsmen have scattered grain for the birds which were not snowed under. The snow drifted so much that it left plenty of bare ground. Hawks are very numerous.

Van Hiseville.—I think fully fifty per cent. of the birds have perished. Some few have been fed.

West Creek.—The destruction of game has been greater than for years before. In a few instances the farmers have fed the quail. About sixty per cent. of them have been killed by the snows.

Wheatland.—I think a very large proportion of quail and pheasants (ruffed grouse) are killed, and nearly one-half of the rabbits.

Whiting.—Probably two-thirds of the quail—which were unusually plentiful last fall—have perished. A few flocks were fed.

CAMDEN COUNTY.

Atco.—The winter was very severe on the game. The quail suffered from cold, deep snows, want of food, gravel and water. Some farmers fed. The loss has been greater than in many years.

Atco.—Have not seen any quail since the snow. I had a lot of corn in the shuck that the show caught out, and the birds helped themselves to it.

Berlin.—The winter has been extremely hard upon the game. It has killed most of the quail. The farmers tried to feed them as much as they could, but still they have perished. Many rabbits have died from starvation.

Blackwoodtown.—There was a number of quail and rabbits left last fall, but the winter killed one-half of the quail and one-fifth of the rabbits. Some bunches of quail were fed. The destruction was the greatest in many years.

Camden.—The injury to game in our section, resulting from last winter's snows, has been slight. The snows do not seriously affect game in South Jersey, and feed is plenty.

Cramer's Hill.—Too close to the city of Camden for birds.

Gloucester City.—Quail were very plenty up to the second big snow. After that they began to get scarce, and the farmers would find coveys of from five to fifteen dead—frozen in the snow. That is the talk at the stores—"So-and-So found so many in his swamp, dead." Farmers had to feed out their corn stalks, and that stopped a good deal of picking for the birds.

Haddonfield.—Fully fifty per cent. of the game has perished by cold and starvation, and about ten per cent. of the small birds. The game was fed when found.

Sicklerville.—Most of the birds, if not all, perished in the snow, a very uncommon thing with us. I have yet to hear of the first bird survivor. The farmers were prevented from feeding by the snow. There have only been six caged birds wintered about this section.

Spring Mills.—From what I know and can learn very few birds and rabits have been left over. Whole flocks have been found frozen to death. I have never known the destruction to be anything like as bad. Seventy-five per cent. have perished. Only one farmer has fed birds, and that a small covey.

Waterford Works.—I think a much larger percentage of the quail have perished than usual. Cannot estimate percentage. Birds have been fed when practicable. Other game has not suffered as much.

Waterford Works.—There was a large number of quail here before the snow. I have seen but one since the snow, and that came by itself. I fed it daily until the snow was gone. It will be years before there are as many again.

GLOUCESTER COUNTY.

Almonesson.—The destruction of birds has been greater this winter than I ever knew in this section. About half have died. The farmers saved some. Rabbits are as thick as ever. Pheasants (ruffed grouse) have not been killed to any extent.

Clarksborough.—The weather has been very severe on the quail and rabbits. A few bevies have been found frozen to death and also dead rabbits have been found. There are a few quail left, also a few rabbits. I have seen two small bevies in our vicinity.

Clarksborough.—In regard to game in this vicinity, I would say that there has been a great number of quail frozen to death, although I tried to prevent it myself. With the help of a few farmers we have taken bundles of wheat in the straw and placed in the localities where the birds were apt to come and feed. I have the pleasure to know that we have a few left for seed.

Five Points.—I would say two-thirds of the birds have perished this last winter. Some of the farmers did feed, but it did not save the quail.

Five Points.—Two-thirds of the quail have been destroyed, although many tried to care for them.

Glassborough.—The most severe winter we have ever had. A few ruffed grouse and a very few quail are left. Nine-tenths of the quail perished. We had more quail left last season than I ever knew; the shooting was very good, but it looks as if it would be years before we have such sport again.

Glassborough.—Birds are gone. I wintered a few and fourteen lived over in a barn. Farmers tried to feed the quail. There are a few rabbits and pheasants (ruffed grouse) left.

Harrisonville.—The winter has been an exceptionally severe one. Loss in game unusually heavy; should think one-half have perished. Farmers have generally fed them. Have heard no talk of the West Jersey Game Pro. Society.

Hurffville.—In some parts of this section the farmers have cared for the birds, but notwithstanding, the destruction has been at least at the rate of fifty per cent.

Janvier.—At least eighty per cent. of the quail have lost their lives from the severe winter. I believe the farmers tried to feed the birds.

Jefferson.—The extreme cold weather and snows have destroyed 90 per cent. of the birds. The few that now live were saved by the farmers and residents.

Malaga.—I am sorry to say that little interest was taken in this section by sportsmen and farmers. The quail suffered very much in this section.

Malaga.—This has been the most destructive winter on quail in this section for twenty-five years. The quail were very wild, and did not come to the buildings, as in old times. Feed did little good, as it snowed almost every day. I saved about one dozen. We have probably about fifty left in and about here. Rabbits are plenty. Larks are all gone.

Swedesborough.—Farmers fed the birds to the best of their ability, and with all of their efforts to save them they perished—fifty per cent.

Turnerville.—The cold and snow has been harder on game than was ever before known. About seventy-five per cent. perished. The farmers tried to feed the quail.

Unionville.—The birds in this section have all perished except ten, which I have kept throughout the winter. I know of no living birds. I have four cocks and six hens. Have been all over the fields and woods and cannot find a live bird, but have found dead ones.

Wenonah.—From the best information which I can gain, most of the game mentioned, in this region, has perished. There may be say ten per cent. of last fall's stock alive. A few farmers tried to feed them. I had a covey of eighteen

on my place and tried to get them under cover and feed them, but think they all perished. I have seen none since the first heavy storm. Grouse are rare here at all times. Game cannot stand such winters.

Westville.—The snow was hard on the quail in this section and killed quite a good many. The farmers did feed some. I know of two flocks of eight or ten.

Woodbury.—There has not been so destructive a winter on game for twenty years. Fully ninety per cent. of the quail have perished. Feeding quail amounts to little else than bating hawks.

Woodbury.—This is not, strictly speaking, a game section, but one sometimes finds a good day's work in the autumn. The winter has been very severe on all birds and many have been found dead, mere bunches of bones and feathers. Fully forty per cent. of our quail have died from the cold. In some places the hawks made a clean sweep.

ATLANTIC COUNTY.

Atlantic City.—In the count a large percentage of the birds have perished, except along the salt meadows, where some of them have survived. Rabbits have not been killed much by the cold and snow.

Atlantic City.—I hunted a good deal this winter through the woods of our county, and since the deep snows have run foxes, and can say that I have not seen a bird that has perished from the winter. I think they only perished in the newspapers of these parts.

Bargaintown.—The heavy snow drifts and hail storms of this past winter have nearly used up all the quail. I should think at least from 60 to 75 per cent. have perished. The quail are generally fed.

Cedar Lake.—The cold and snows have destroyed a great portion of the small game—a much larger percentage than in former years; fully ninety per cent. have perished. I have seen but one covey since the January snows. It lived on my place and fed regularly in my yard with the fowls. There were thirteen birds in all.

Cedar Lake.—The game has all been destroyed at this place.

Decosta.—The deep snow and continued cold weather have had a bad effect on birds and rabbits. About fifty per cent. perished. The farmers fed the birds freely.

Estelville.—I think most of the quail have perished. Some parties put out feed for them.

Decosta.—The past winter was very severe on quail, but I believe the majority saved themselves in the dense swamps. Pheasants (ruffed grouse) stood it first-rate. I have found very few dead birds, and I believe that but very few sound birds perished from exposure. Quail have fed to a large extent on acorns, and would neglect the feed I put out for them to hunt up the acorns. As soon as they had fed they would fly to the thickest swamps and stick close to them, as if they knew it was going to be a hard winter.

Hammonton.—We have had a fearful winter for the quail, but I am happy to state that we have a few birds left over.

Hammonton.—The past winter has been very severe and destructive to the game generally, much greater than usual, as our winters are ordinarily very mild. About one-half are dead. The farmers have, in a great many cases, fed the birds.

Hammonton.—The severe cold of the past winter has been very destructive to game birds in this section, only a small percentage of them remaining alive, which was only in a few instances.

Landisville.—As far as can be ascertained at this time, rabbits have suffered during the prevalence of the deep snows. Partridges are very scarce here at all times. Quail are generally plenty in the shooting season, but last fall they were hard to find and especially so just before the snows. Indeed so marked was this as to lead to the belief that instinct led them to migrate. None are to be seen or heard of now. A number of small birds have died to my knowledge,

Smith's Landing.—Birds are so scarce that you cannot find them. I have not seen any this winter. This is a poor place for birds.

Steelmanville.—They are all dead.

SALEM COUNTY.

Centreton—About one half the quail have perished. Farmers feed them when they come close to the buildings.

Centreton.—The cold has been very serious. Many birds have frozen to death and starved. The destruction has been greater than in other years. One-half the birds left at the termination of the gunning season have perished. The birds were fed when found. The hawks killed many.

Elmer.—This has been the most severe winter upon game known in many years. The snow has covered the ground a greater part of the winter, and the thermometer touched 22 deg. below zero. I believe there is not a single quail left around here. There are a few rabbits. Our sportsmen are talking of restocking this vicinity.

Hancock Bridge.—The severe winter weather has been very destructive to a portion of our birds, the quail particularly. Farmers have fed them only in rare cases. Our small winter birds have done better.

Marshalltown.—Whole flocks of quail have been found dead under the snow. At least two-thirds of the birds perished. The farmers tried to feed them but the snows prevented.

Palatine.—My observation leads me to the conclusion that the game in this section has very generally perished. In a few instances the farmers have fed.

Palatine.—This winter has been very hard on the game, especially birds. I think I can safely say that ninety-five out of every hundred quail perished with the first cold snow. I know of but two coveys that wintered outdoors. They have been fed. A few have been caught in traps and wintered over. I haven't heard a whistle of a bird this spring.

Pennsville.—The cold whether here has been very destructive to the game. At the beginning of the last season game was more plentiful than it had been for many years. Of course, such game as woodcock, snipe, rail, etc., migrated, and were not affected. More quail and rabbits were killed here during the gunning season than for many years. But after the season was over we still had plenty of game left. At least four-fifths of the game has been destroyed by the cold weather. I have not seen nor heard of a quail since the snows. The birds were not fed.

Salem.—Game in this section, so far as I can learn from the farmers and game men, has nearly all perished. Quail, especially, have suffered, except in a few cases, where the farmers have fed them through the winter. Those that have not been thus protected have nearly all starved or frozen to death. Rabbits have fared better, as they could live on the bark and twigs of trees. Still, I have heard of some of them perishing, but the percentage is small. Small birds have all suffered severely.

Salem.—Report says nearly all the birds killed. One man found three flocks frozen, containing respectively nine, fourteen and six, all under one bush. Very poor show for next year unless we import birds.

Shirley.—Two parties feed seven and ten birds here, and I know of no others. I know two hundred quail were frozen.

Shirley.—Bunches containing ten to twelve quail have been found all frozen to death. The percentage of loss has been greater than ever before.

Woodstown.—Quite a number of birds perished in our country. Quail suffered the most. At least twenty-five per cent are dead. The farmers fed until they could not get to the birds on account of the snows.

Yorktown.—It is hard to tell about our birds yet, but it is supposed that the most of the quails have been frozen or starved. Some of the farmers have fed them, but I have not heard of any one seeing any as yet this spring.

CUMBERLAND COUNTY.

Bridgeton.—A good many quail have been destroyed during the past winter. Quail were never more abundant than during last year, which fact probably renders their destruction more noticeable. Enough have survived, however, to "seed" this region. Some farmers have fed and maintained coveys, the majority have not.

Deerfield Street.—As far as I know I think that the game has been destroyed by the snows. Many coveys of quail have been found dead in the snows.

Deerfield Street.—The cold weather has been very hard on the quail hereabouts, and as far as I can learn there are but few left.

Fairton.—I think one-quarter of the birds have frozen and starved to death. Quail were very plenty with us last Fall, but I am afraid we will not have much sport next Fall.

Fairton.—This winter has been hard on the quail, but some birds got through. I suppose about twenty-five per cent. perished by the snow and cold. The hawks have killed a good many. Our heavy cover has saved a number. Some few of us fed the birds.

Hallyville.—The cold and snows have been very severe on the game in this vicinity. I presume that the quail have nearly all perished, as they were not cared for.

Maine Avenue.—I have seen no quail or rabbits since the cold weather. I think they have perished to a great extent.

Maine Avenue.—I have not seen a quail since the first heavy snow. There were half a dozen bunches on and near our farm, but I could not find them to feed. There were plenty before the snow.

Manumuskin.—As far as I can learn the game in this section has not been materially lessened during the past winter by cold weather. A greater percentage has been killed by gunners, owing to the advantages offered by tracking the birds on the snow.

Millville.—The effect of the cold and heavy snows on the game in this section has been very severe. The destruction of game has been far in excess to that of former years. Whole bevies of quail have been found frozen to death under the snow drifts. Rabbits were frozen in their beds. Fully sixty per cent. of the birds perished. Farmers have tried to feed the birds.

Newport.—The cold has killed but a very small percentage of the birds. About one-tenth died from starvation. No one fed them. Rabbits have wintered well.

North Vineland.—The destruction of birds has been much greater than in past years. They were fed in many instances by the citizens.

Roadstown.—The destruction of game caused by the extreme cold has been twenty-five per cent. greater than ever before. Some farmers and residents fed the birds.

Roadstown.—At least seventy-five per cent. of all the game in this section has been killed by the cold. A few farmers feed the quail.

Rosenhayn.—The last winter has almost destroyed game in this section. Hundreds of quail were found frozen in the woods. Rabbits did not seem to suffer so much. I fed the birds, but cannot speak for others.

Rosenhayn.—I once in a while hear a quail whistling; a few left.

South Vineland.—The farmers very generally feed the quail, and thus the number that perished was greatly lessened.

Vineland.—The severe winter has been very destructive to the quail and other game. The percentage destroyed is very much larger than in fourteen years. Large flocks have been found frozen. The birds were fed to a moderate extent.

CAPE MAY COUNTY.

Cape May.—

N'ary a dead bird here,
No snow to lie this year;
When the sea-breeze blows
It melts and goes,
And the woodcock bobs up his tail and crows,
And into the soft ground sticks his nose.

The quail on a stump whistles in glee,
And says quite plainly, "Can't you see
What the wind has done, that blows from the sea?—
It's made the ground bare for *me, me, me.*"

The rabbit in the bushes simply winks his ear,
Thinks it pretty cold for the season of the year;
But never has a care, for he cocks up his eye,
And then he spies a turnip in the field close by.

[But whether the bunny secures his prize or not we are unable to say, for our Byronic correspondent comes to a sudden termination and says, "Card guv out."]

Cape May.—About twenty per cent. of the game has perished on account of the severity of the winter. Quail and woodcock have suffered most.

Dennisville.—I should think from forty to fifty per cent. of the birds have perished. Very few of the farmers fed the game.

Green's Creek.—The winter has been very trying to the quail; many have perished in this section. Many of the farmers fed the birds.

Seaville—Some birds have perished. The birds visit farm yards and have not suffered much for want of food The hawks have destroyed more than the cold weather.

South Dennis.—The destruction of birds has been very severe. No one fed them.

Townsend's Inlet.—The snow and cold weather have had a bad effect on game. The destruction of birds has been noticeably greater this winter than in many years past. Many of the residents fed the birds which frequented the houses and gardens.

Tuckahoe.—We have been feeding fourteen coveys of birds all winter. My son and I have killed fifty-four hawks this winter. They are the rascals that do most harm—they kill all the year round. Have not found any birds frozen.

DEATH OF THE FOX.—Springfield, Mass., March 15.—*Editor Forest and Stream:* "Beware the ides of March," for again has this fateful day wrought its historical tradition of woe. Again a royal head has rolled in the dust upon this dread anniversary. Long time has King Reynard with despotic sway lorded it over his trembling subjects. Long time has the beautiful amphitheatre containing the rifle range of the Rod and Gun Club been the scene of nightly murder most foul. Long time has this swift footed prince of darkness with preternatural cunning eluded the dogged persistency of deadly foes. But his last race is run, his last trick is played, and his ghastly corse now hangs upon the greenwood tree whilom the gibbet of countless hordes of his forefathers. Samson "did the deed." (We dubbed him "Samson" when he made that double shot and killed a fox right and left.) The dogs routed him at the south end, and after a few turns and doubles he eluded all seven of us and put straight for the upper end with the screaming dogs close at his heels With blood in our eyes and vengeance in our hearts we instinctively, as it were, formed a cordon across from street to river, and with unbroken front relentlessly, piteously pursued our foe. The balmy air was trembling and vibrating with the delicious sound of the "heavenly music" as we followed the exciting chase. Now we hear the bugle notes at the upper end, and, as the volume of sound gradually increases, we know the quarry has turned, and each trusty weapon is tightly grasped, each greedy ear drinks in the glorious melody, each eager eye restlessly scans the ground in front, each throbbing heart beats a quick response to every trumpet cry as we anxiously await the supreme moment that shall bring our stealthy foe within range of the death dealing tube. Now we hear the eager dog upon the brow of the bluff and know that the life of our fleet footed foe is not worth five minutes' purchase, for Samson guards that spot, and Samson's eye is true and Samson's nerves are steel Now his quick eye sights the swiftly coming form and he suddenly becomes statuesque as gamey pointer with the hot scent of bird before him. Now but forty yards intervene, and quick as a flash the ready gun leaps to his shoulder, and responsive to its voice those swift-winged feet are swifter flying, but with no foothold save empty air, and soon the gleaming fangs of the frantic dogs are burried in his quivering flesh, and as we add the white-tipped brush to our long list we loudly voice our triumph and exchange mutual congratulations that one more despoiler of our forest and stubble has received his just reward. SHADOW.

LAW BREAKERS ALARMED—Childwold, South Colton, N. Y.—The exemplary justice so swiftly dealt to the culprits who took trout from Lake Placid illegally which FOREST AND STREAM gave such wide publicity to recently has had a salutary effect in regions supposed to lie just beyond the ken of law. A stranger came here some time since and took 200 pounds of lake trout from Lake Massawiepie some of them weighing fourteen pound, salted and toted them away. But such an event could not come off here now. The active measures taken by various protective societies in offering generous rewards, etc., for the detection of transgressors has had not only a cautionary effect, but also that of constituting every man a detective.

An amusing illustration of this took place here last week. Two men went out, both of them doubtless with the intention of appeasing a cervinivorous longing by killing a deer illegally, but coming upon each other's trail they were both suddenly converted into apostles of the law and self-constituted detectives, and shadowed each other for the rest of the day. When they came face to face their mutual accusations led to a strife that came near ending in their having to pay *were-geld* instead of receiving the much coveted reward.

This region affords excellent sport, and should be better known to your readers. It has been heretofore resorted to less by sportsmen than hunters, but the new and improved roads consequent to the starting of a new farming settlement here two years ago has made it more accessible to and more frequented by sportsmen and tourists.

Some 200 deer, several bears and a pair of panthers were killed last autumn within a radius of five miles. This area would take in Grass River, a fine trout stream on the west, its affluent, Lake Massawiepie abounding in lake trout, and Arab Mountain half way to Tupper's Lake on the south, the Raquette River with Sol's Island and the Moosehead still-water on the east and north. The killing of the panthers was noticed in a late issue of your paper. The female measured nine feet between tips of nose and tail, and the male porportionately larger. The former was killed by a hunter, H. Hutchings, while stalking for deer last November at which time he followed the male two days without getting a shot at him. He abandoned the pursuit for two months when he resumed it, and after following him three days he succeeded in treeing and killing the brute. After having been frozen he was taken out of the woods standing erect with head and tail elevated.

He was taken through the villages in this natural pose much to the terror and delight of the villagers *en route.* These fierce denizens of the forest are nearly extinct in this part of the country and will soon be quite so. C.

POINT OF GREATEST ERROR.—Littleton, N. H., March 11, 1881.—Under the heading "How to Aim the Hunting Rifle," Mr. Merrill says: "I have omitted to state that 52-100 yards approximately shows the point in the range where the trajectory is the highest, and 55-100 the point of greatest error." Now, what does "the point of greatest error" imply? In other words, what does he mean?—J. I

Major replies as follows:

The error of the rifle at any point of the range is the distance the ball is from the line sight at this point. At 55-100 yards it is off and above the line of sight about two inches, and hence the rifle shoots too high here. But the "highest point of the trajectory" is its highest point above its base. The base is regarded as a straight line connecting the centre of the muzzle of the piece with the centre of the target, or point blank. The error, 55-100, is measured from the line of sight, but the height of the trajectory, 52-100, from the base of the same. These two distinct lines are not parallel, but converge and intersect at the centre of the target; hence the two points .52 and .55 arise.

FIRST ENGLISH SNIPE.—Neversink Lodge, Guymard, Orange Co., N. Y., March 22, 1881.—Philip Thurtle, my keeper, reports the first woodcock on Saturday, the 19th, and to-day, while out with Croxteth and some youngsters, he killed the first snipe, which I herewith send you. Has there been, in 1881, one killed before in the vicinity of New York?

Your truly, A. E. GODEFFROY.

RECOLLECTIONS OF TROUTING IN SWITZERLAND

UPON the grassy banks of British trout streams a spike that screws into the butt of the rod is most invaluable to, and is, indeed, generally used by the angler, enabling him to stick his rod into the ground in an upright position when it is necessary for him to disentangle his line from the boughs of trees, rocks, snags, or any other of the numerous enemies that assail the temper of the fisherman.

It was in the palmiest days of the Second Empire that, as a lad, I was about to step on board the train at one of the railway stations in Paris, my thoughts intent on Alpine trout streams, and entirely oblivious of the paternal nature of the government under whose protection I had temporarily placed myself.

In my hand I carried the weapon of our craft clad in its orthodox drab case—the most harmless-looking piece of personal property one would have supposed, and little calculated to rouse the suspicions of the most vigilant officialism.

Possibly the rod itself might have passed unnoticed, but, alas, I had neglected to unscrew the steel spike that was attached to the butt, and its formidable point protruded beyond the case in which the rod was wrapped at once transforming its bearer in the eyes of the suspicious Frenchmen from a harmless and youthful tourist to a ferocious and bloody conspirator.

Stern hands were laid upon my shoulders; a sea of mustached faces and gesticulating arms waved around me; my little ten-footer was solemnly arrested and made the subject of a most serious and prolonged investigation. It was a dagger! It was a spear! A veritable assegai! The emperor's life had been but recently attempted and the keen scrutiny and sharpened wits of these worthies were amazing to behold. The case was evidently too important to be disposed of in such an informal manner, and I was requested to remain with one of these green functionaries of Bonaparte while it was carried to a higher court.

What transpired within those closed doors I know not; but when the procession returned bearing the rod in front of them I was given to understand that if the spike (the cause of offence) was removed, I should no longer be considered a specially dangerous character.

Now, the spike had rusted into the butt of the rod and the screw refused to turn, which was probably the reason of its being there. Two officers were appointed to affect the important and onerous duty of removing it. One was told off to hold the butt of the rod tight, another to twist the screw—and at it they went.

By this time quite a crowd had collected and formed a circle within which these imperial satellites leaped and twisted, puffed and grunted, snorted, wheezed and sacre'd in their endeavors to draw the tooth of the offender.

I sat in the meantime upon a trunk, an amused spectator, and made an entry of this official war dance in my sketch book.

At last, however, the efforts of the Government were rewarded. Napoleon ceased to tremble upon his throne and I walked forth a free man.

Talking of continental officialism reminds me of a story a Virginian friend used to relate of his father, who, having got into some scrape with the railroad officials in Switzerland, turned, by a strange antic, their ruffled dignity into mirth and good humor.

The old gentleman was in his way an inimitable actor and mimic, but being distinguished as a financier rather than a linguist, was at a loss in this case for words to make the excited officials understand that he was describing a starting train. Without more ado, however, he deliberately took his hat off, and, going down upon his hands and knees, traveled along the platform through the crowd, blowing and snorting like an engine. The spectators shouted with delight. The officials embraced one another in the exuberance of their mirth, and the old gentleman more than gained his point, for he came out of his difficulty not only unscathed but with flying colors, and was offered a large sum by the manager of a traveling theatrical company who was present to come on his establishment as a comedian.

At the time of which I write the Engadine was beginning to be famous as a place of attraction to tourists, and the great bare hotels at Pontresina and St. Moritz, upon the chain of lakes that form the headquarters of the river Tun, were receiving hundreds into their cheerless halls. In both lakes and streams were and are still to be found in greater or less numbers, even at the highest elevation, where the latter first emerge from the icy caverns of the glaciers where their water is as yellow and foul from the moraines as if it had been draining some great manufacturing city, a few lean and pale specimens of the trout kind stem the roaring flood, and eke out an existence the miserable character of which is demonstrated by their insipid and flavorless bodies.

The lakes of the Engadine, however, are fresh in color, and so is the river Tun, which connects them, and winds from one to the other through meadows whose coloring and fertility are in strange contrast to the cold white peaks and sterile slopes that overhang them.

Few anglers in those days were to be met with either by lake or river—that is to say, foreign anglers. The natives, though, were in tremendous force, fishing for the hotels, and to judge from their tackle and their success it must have required at least two piscators to keep each guest in fish. I have seen rods in the Virginia mountains of considerable altitude; specimens, too, I have seen in the backwoods of Canada that might lay claim to distinction as regards length and stoutness, but they would have been cast into the shade by comparison with the gigantic instruments with which these Switzers hurled forth their clumsy lines. What flies they were, too! Black or red cock hackles, tied rudely on to the hook, not even twisted round them. The sight of one of these hardy patriots returning at even with his spoils was one of the most disproportioned sporting pictures that could well be imagined. First came the pole, enormous and unwieldy; apparently staggering beneath it came the man, and dangling from his hand would be two or three small trout, the product for the day of this great apparatus. Their gratitude for a well made fly or two was boundless. I remember making a present of half a dozen to an angling waiter, at the little hotel that stood then upon the "Sils Maria," and tears of thankfulness trickled down his furrowed cheeks. He fished in the lake, I heard, the whole of the two following nights.

A friend from college, on the trip in question, joined me at Chin, and from thence, with knapsack on back, we took the road.

D. was not by any means an angler—at that time, in fact, he looked with the greatest contempt upon the whole business, and considered my passion for it as a harmless phase of lunacy. He was a great muscular Christian, though; regarded Charles Kingsley as the greatest of men, weighed himself once a week and carried dumb-bells in his knapsack, which might fairly have been considered the last stage of the mania. He was as much bent, too, on scaling giddy heights as I was on snaring the wily trout, but, being a sociable being, he considered that there would be more difficulty in forcing an unwilling horse up the thousand feet than in keeping him company at the bottom; so he bought a native rod—under protest—not less than twenty-two feet long, in one piece, and carried it for fifty miles along the road through villages and roads like a standard, to the wonder of the inhabitants.

The Sils Maria, before mentioned, was, in spite of the ill-success of the natives, a capital lake for fishing in those days. It must have been, if memory serves me aright, some two or three miles long, bordered by meadow-lands and pine woods and overhung by lofty mountains. On windy days we would fish with flies from rocky headlands and catch great numbers of trout. In the river, too, that poured out of the lake and lost itself in the larger waters of the "Silva Plana," we had rare luck on more than one occasion. I say we, for D. soon became an enthusiastic fisherman and fairly forgot the snow-capped peaks that had once had such an attraction for him.

We used to get in terrible hot water with the riparian proprietors, as the hay crop was uncut, and the Swiss law of trespass is very stringent as regards rivers that are bounded by meadow lands. I say we used to get into hot water, but I could only judge so (neither of us being distinguished as German scholars) from the long and continuous orations that elderly gentlemen, with passion written on their faces, used to hurl at us from afar, but we were schoolboys or next door to it, and lads at that age are not as sensitive on such matters with pleasure in view as their elders perhaps, and we fished straight ahead, and afforded occasionally considerable amusement to the passers-by who happened to come in for these one-sided interviews.

There was a beautiful lake at a place called "Le Prese," lying, if I remember right, on the Italian side of the Stelvis pass that fairly teemed with the pink-fleshed lake trout, very much like those of the famous Loch Leven in Scotland, and averaging about one pound apiece. From the garden of the snug hotel that invited visitors to stop upon the shores you could see upon a summer's evening the whole surface of the water covered with rings as they were feeding on the top. The cross line, as used in parts of Scotland I was surprised to find here in vogue. Cross-line fishing on a lake with boats consists of a long gut line stretched between two boats, which row cautiously and quietly along, keeping at that exact distance from one another which will maintain the line "taut" without breaking it, a more difficult matter with such light tackle than might be supposed. From this cross line are hung at intervals of every two feet or so flies upon gut droppers, so arranged as to skim the top of the water. The trout rise and hook themselves, and when several are secured the haul is taken in. This a most deadly and unsportsmanlike mode of killing trout, of course, but in the latitudes we speak of sporting instincts as understood by Anglo-Saxon communities do not exist.

The ordinary brook trout of Switzerland when once you get out of the immediate influence of the glacier water is exactly similar to his namesake of North America. I have direful recollections though of an ugly trick the hotel keepers had of serving him—boiled and cold. Fancy a cold, boiled quarter pound brook trout, qualified as it was in those days in the Engadine hotels with alternate courses of tough kid and incivility! Things are doubtless changed now since all the world and his wife have taken to going there, and when, even in the dead of winter, the frozen lakes ring, I am told beneath the skakes of men and women, who, at a lower elevation, the dead hand of consumption would be claiming for its own and who would be adding to the number of those unfortunates who in wraps and respirators crawl along the seashore or the watering places of South. RINGWOOD.

THE SUCCULENT CATFISH—Savannah, Tenn., March 5.—I am glad to see that your paper is turning some attention to the catfish. This fish although it has for a long time furnished a large part of our population with an excellent and cheap article of food has been treated with contempt by the press. In fact, as I have had occasion to remark before, it is a fish more generally abused and more generally eaten than any other that swims in our waters. We have in the Tennessee River and its tributaries three species of catfish: the blue or channel cat, the yellow or mud cat, and a mottled variety with a long, broad and somewhat flattened head, known here as the tortoise-shell cat.

The first named of these is a game fish, and grows to a larger size than the other two speecies. This fish affords considerable sport to the angler, and while not so rapid in its movements and not coming to the surface and leaping from the water when hooked as the bass does, still makes long runs and fights long and stubbornly before he gives up. Herbert includes this fish in his book of fishes, but evidently knew little of it from actual experience. The largest fish of this kind that has been taken here for many years was caught some two years ago by the sheriff of this county, and weighed 156 pounds.

The catfish are taken in a great number of ways, in bailed nets, in traps, on trout lines, throw lines and by jugging or float fishing. It seems to be in fine condition at all seasons of the year, being always fat, and is in fine state for the table during the hot summer months when the bass are full of parasites, and the down and buffalo are not fit to eat.

It seems to be a fact peculiar to the catfish that the flesh of the very large ones is as fine grained and as tender as that of the fish of the smaller size. There is a preference given in market to medium sized fish of from 1 to 6 lbs weight. This is due to a prejudice against the diet of the big fish, which are generally regarded as a race of fresh water scavengers. The catfish is omnivorous and will bite at anything edible. The bait generally used on trot lines is small crayfish and perch, but beef, liver or fresh meat of any kind is equally good. The methods of cooking vary according to the size of the fish. The small ones are generally fried, while the larger sizes are baked or boiled, the very large ones are cut into steaks. When sliced across the grain and fried with salt pork the catfish is considered very fine.

For my own eating I prefer a medium sized yellow cat boiled in salt water and served with egg sauce and walnut catsup. When properly cooked such a fish is as good as any we can procure away from the salt water, and the baked fish are nearly as good as the red snapper. WILL.

THREE DAYS' SPORT ON THE RANGELEYS

A JOLLY trio it was that pushed their boats off the Middle Dam Camp Landing one fine morning early in the month of June last, for we well knew that sport was near at hand, as we could see trout breaking water only a few rods below.

Armed with the latest edition of split bamboo rods and a good selection of flies, we felt able to kill any fish that dare take one.

We were soon in position, with our boats some five rods apart, and just at the upper edge of the rapid water. Ten minutes found us all busy, as the fish rose well, and a merry time we had of it for two hours, taking about forty trout, which weighed from one-half to two pounds. By this time the small fish had been well cleaned out, and we began to wonder where all the larger ones were, when suddenly a yell of delight broke upon the air, and, "Jerusalem! what a trout!" came across the water. Turning my eyes toward that veteran angler, Chesebro, I beheld that worthy well braced in his boat, with both hands firmly clutching his rod, which was bent to a half circle, with the reel singing and boat swaying first to right and then to left, with such exclamations, "yanked" out in monosyllables, as, "Great—gra-cious—see—how—he—pulls! See! he has started for the upper dam, Ed, as true as I live, but I will stop him or smash this rod," came distinctly across the water, when a splash greeted my ears, the water was dashed into my face, and my line was hauled off the reel some fifty feet before I knew what I was about, and I had all the business I could attend to. After a good, square fight of twenty minutes I landed a three and one-half pounder, and we kept up the sport until the old bell at camp pealed out its welcome call for dinner. Sixty pounds of trout were landed that forenoon, and it is safe to say no other fishermen were ever better satisfied with a half day's sport than we were.

The next day the gates of Mid Ile Dam were shut down, which stopped the current on the rips above and spoiled the fishing; so Sargent, of Upton, a most excellent guide, whisper red the fact to me that the fishing would be good at Cedar Stump, five miles down the river. But how to get a boat down there was the next conundrum to crack. I suggested to Sargent to run the rapids in his boat to Pond-in-River, then haul down on buck-board. The old guide said no man had ever run the rapid river in a light boat and come out alive, that he knew of; but, getting his blood up, he finally said he would do it or smash the boat.

So early next morning the boat was shoved through the sluice-way, the old guide and trapper stepped in, and away she flew like an arrow from a cross-bow. Down through the seething current rushed the light boat, with the guide standing erect, well back of the bow, with the oar poised ahead to guide her clear from the rocks that cropped out of the river in many places; with his hair streaming in the wind and stern, set visage, he looked the hero that he really was. Plunging through some narrow gorge, the boat would lift itself half its length clear of the water, as it shot over some falls and balanced its quivering form on the whirling eddy below. On and on she plowed, leaping and struggling for very life through Rapid River for a mile, until at last she lay floating like a feather on Pond-in-the-River, while on the face of her master could be seen a look of perfect satisfaction.

At about 10 A. M. the boat was landed at Cedar Swamp. In the centre sat the guide to handle the boat and net the fish, in the bow myself, and in the stern a young "Nimrod," who takes to hunting and fishing as readily as a "duck takes to water," and as this was his trial trip he wished to test his skill a little.

I have spent many months in the Maine woods, but never did I have two hours better fishing than from ten to twelve that day. At the end of an hour a large fish rose, and was struck by "Nimrod."

If the one who reads this ever handled a four-pound trout in a swift current he can appreciate the situation for the next half hour. Up the river he would work his way, then down the stream with a rush that would make the line hiss, as it cut through the water; but no fish could stand that test long, and as the mottled line was creeping gradually up through the rings over the reel with its fearful tension, the noble fellow slowly yielded and finally gave up the fight, and as the landing-net was gently passed under his great golden side, and he was laid in the bottom of the boat, a "war whoop" that echoed and re-echoed for miles around came from the throat of Nimrod, who had handled his fish better than most old fishermen would have done. Our catch was not so numerous, but eleven trout weighing twenty-three pounds was the number and weight of them.

The next day we decided to go to "Trout Cove," as Fred Barker had sent word that the fish had struck on up at the Cove, and not a sportsman at Upper Dam Camp. So Nimrod and I took steamer for that place, and at 11 A. M. we were at it, and whipped Trout Cove for three hours. When we strung our fish we counted just sixty trout, weighing from one-half to one and a half pounds. When we ungirted our rods that day, we declared no two men had ever enjoyed three days' liner sport than we had. E. T. W.

Putnam, Conn., Dec. 25, 1880.

THE FLY-CASTING TOURNAMENT.—Those who contemplate giving prizes to this tournament will do well to read the article in our issue of the 17th inst., headed "N. Y. Association," which refers to the elaborate programme of nearly 200 pages in which the advertisements of all donors of valuable prizes are to be placed, subject to certain conditions. Those having charge of the matter promise that the fly-casting will exceed in interest and number of prizes anything before attempted, and an arrangement of prizes which will be acceptable to amateurs, who have heretofore been deterred from entering the lists on account of there being only one class, in which well-known champions were entered. This

year the champions will have a class as usual, and their contest will not lack for prizes and interest, but there will be other classes also; one which bars all who have ever won a 1st prize, and another, for amateurs especially, which bars all who have ever won any prize at a State tournament. Messrs. Conroy, Bissett & Malleson write to a member of the prize committee as follows:

MR. C. W. WINGERT:

Dear Sir—We will contribute one of our split bamboo fly-rods, one click reel, and one Holberton's full-length fly-book, with improved Hyde clips and Russia leather cover. We wish these to go for prizes in fly-casting, and would be obliged for a list of prizes, so that we can name conditions, etc.

CONROY, BISSETT & MALLESON.

Messrs. Abbey & Imbrie write to the director of the fly-casting tournament:

MR. FRED MATHER:

Dear Sir—You may put us down for a valuable prize. Exactly what it will be we have not yet determined, and possibly we will not decide to announce it until you are about ready to make up and close the list. Wishing the tournament every success, we remain very truly yours,

ABBEY & IMBRIE.

FISHING TACKLE IN THE NATIONAL MUSEUM.—The most complete display of fishing tackle in the world is to be seen at the National Museum in Washington. It comprises the bone hooks, seal-skin lines, seal-bladder floats, walrus-hide lines and spears and lances of bone used by the Indians of Alaska; the wooden hooks and all combinations of wood, bone and metal hooks and spears of the Esquimaux and the natives of our northeast coast; the enormous shark and halibut hooks, with a full set of all hooks, lines, floats, and floats used in the commercial fisheries of our East and West coasts down to the various rods, reels, lines, flies, floats, creels, etc., of the scientific angler. These latter have been purchased from our American dealers, the larger part just before the Fishery Exhibition at Berlin, and now Prof. G. Browne Goode, the curator of the museum, acknowledges the receipt of a donation of an elegant collection of English made angler's goods, consisting of hooks made for the American market, artificial baits, insects, flies, etc., from S. Allcock & Co., Redditch, England, whose advertisement will be found in our columns.

THE LUXURIES OF ANGLING.—The Richmond, Va., *Whig*, says: "One has only to examine the advertising columns of FOREST AND STREAM to be impressed with the vast amount of industry, skill, talent, enterprise and genius, and philanthrophy (emphatically) devoted to this task of supplying the needs and luxuries and augumenting the pleasures of the sporting community. We say philanthropy, with emphasis—for those who thus toil for the enjoyment and happiness of their fellow-beings cannot be enemies of their kind. But admit that self enters as an element of the motive—in an enlarged sense, it may be truly affirmed, that self, if not a virtue in itself, is next kin to it, and is the basis and prompter of all the virtues."

This is only a part of a column devoted to fishing tackle in which the enterprise of Abbey & Imbrie is spoken of in the highest terms, and mention of Conroy is made. The editor of the *Whig* is a veteran angler, and was formerly one of the Commissioners of Fisheries of his State. He still loves to take the savage bass and smoke his pipe of bamboo root after the victory. Long may he continue.

The best periodical for ladies to take monthly, and from which they will receive the greatest benefit, is Hop Bitters.

Fish Culture.

ANGLING.

FROM a lecture upon Fisculture and Angling, delivered by Rev. H. H. Sneed before the Iron, Coal and Manufacturers' Association at Chattanooga, Tenn., of which we have already published the fishcultural portion, we extract the following:

There is another reason why we should cultivate fish, other than as an article of food, and that is for the recreation afforded in angling.

I know I am treading on ground which you may consider debatable, but I assure you I do not in the slightest degree.

I am convinced that as a people we do not recreate enough. Unfortunately, our people are too much bent upon money making. That has become the all absorbing thought, and the idea of spending a day fishing is considered by many a waste of time, while others regard it as a puerile and stupid sport.

It is neither absurd, stupid nor a waste of time to go a fishing, but is one of the most delightful, elevating and invigorating of any of the out-door sports. Fishing, so far from being a stupid pastime, in which one plants himself on the bank of a stream, and plants his rod in the bank and then dozes and dreams waiting for a bite, is, as any trouter or bass fisher will tell you, directly the reverse of it. And, if success is to crown his labors, all his powers of endurance, patience and skill are to be brought into play. I do not know any sport that requires better judgement than fishing. The selection and preparation of tackle, the supply of bait, the state of the weather, the condition of the water, and just that place in the pool where your trout or bass lurks to seize the prey, the striking of your fish, the management of him after he has gorged the bait, and your successful landing him requires consummate skill and the best management.

EMINENT MEN ANGLERS.

Dr. Nowell, Dean of St. Paul's Cathedral, England, lived to the ripe old age of ninety-five, and Walton says of him that years had not dimmed his eye nor weakened his memory, and that angling and temperance were the cause of it.

Sir Humphrey Davy says: "For my health I thank my ancestors after my God, and I have not squandered what was so bountifully given, and though I do not expect, like our arch patriarch Walton, to number ninety years and upward, yet I hope as long as I can enjoy a vernal day, the warmth and lights of the sunshine, still to haunt the streams, following the example of our late venerable friend, the President of the Royal Academy, Ben West, with whom I have thrown the fly, caught trout, and enjoyed a delightful day of angling and social amusement by the bright clear streams of Wamble.

The Rev. Dr. Paley said to a friend who was anxiously inquiring when one of his great philosophical works would be completed, "As soon as the fly fishing is over," evidently considering this diversion of equal importance with those mental efforts that have rendered his name immortal.

Gay Thompson, John Tobin, Samuel Taylor Coleridge and Sir Walter Scott, all literary characters, were ardent disciples of Walton. Admiral Lord Nelson was so passionately fond of the sport that he fished with his left hand long after he had lost his right. Ben. West, the celebrated painter, engaged in many days sport with Sir Humphrey Davy, and Daniel Webster, America's great statesman, during his lifetime, found relief after a tedious session of Congress in angling for salmon in the Kennebec. And the first Bishop of the Diocese of Tennessee, the late Bishop Key, delighted in following the streams of his adopted State in angler's garb, and enjoying the pleasures afforded by the splendid bass fishing, for which they were famous in the early settlement of the State. And many other distinguished men who

> "Oft have tried with baited hook,
> To tempt the tenant of the brook,"

might be added to the list to show that angling is held in high esteem by all classes of people, but it is unnecessary.

But I am trespassing too largely upon your time in introducing quotations to show you in what estimation angling has been held, but I hope not unprofitably, and therefore I shall give you but one more from the "American Angler."

It is true that many have ridiculed this noble art and pitied its followers, but let those whose extreme and somewhat morbid sensibilities have rendered them blind to the beauties of nature, remember that He who went about doing good chose a number of his disciples from fishermen, and considered them worthy objects of His confidence and His love.

It seems in fine a work of supererogation to attempt to justify that agreeable pastime after the expressed opinion of so many learned and distinguished men of every age, for is there any recreation at once so harmless and with which so many happy associations are blended as angling?"

> "Adieu, ye sports of noise and toil,
> That crowds in senseless strife embroil;
> The jockey's mirth, the huntsman's train,
> Debauch of health and waste of gain,
> More mild delight my life employ,
> The angler's unexpensive joy:
> Here I can sweeten fortune's frowns,
> Nor envy kings the bliss of crowns."

My own experience as an angler heartily echoes all that has been said in its favor; but all men do not agree.

The great and learned Dr. Johnson describes angling to be "a stick and a string with a worm on one end and a fool on the other," but we have an ingenious Spaniard giving the following rebutting testimony: "Rivers and the inhabitants of the watery element were made for wise men to contemplate, and fools to pass by without consideration."

Dr. Johnson never sat in a boat in the mouth of the Emory River, surrounded by the beautiful scenery which greets the angler there, and had a three-pound bass gorge his bait a hundred feet away, and felt that thrill which electrifies you when the saucy fellow leaps three feet clear of the water to shake the hook from his mouth, and the exquisite pleasure of playing him and then flopping him over on your boat; nor did he ever stand on the rim of some pool in the mountain gorge, and watch the deftly cast fly dance along the eddies, and then disappear like magic, and in an instant feel that delightful contest begin between himself and a two-pound trout; nor did he ever strike a fifteen-pound jack salmon, with his trolling line a hundred feet astern of his boat, as he glided over the blue waters of some beautiful lake or stream, or he would never have penned such a severe, though stupid satire.

CHARACTERS OF ANGLERS.

My knowledge of anglers has led me to make this observation, that anglers, as a class, are liberal, large-hearted, generous men, genial and full of good social qualities. Men who have acquired the habit of looking on the bright side of life and of extracting joy from every phase of it, and of trying to make the best of everything. Now and then you find a croaker, not often—a sort of evil phophet—who begins at the very inception of the excursion to predict that no fish will be caught, that the wrong time has been selected, that the water will be too high or too muddy, and really feels a sort of disappointment when the party has made a handsome catch; but even these with them all are, all, are good fellows, and only furnish a little variety.

Jordan and Gilbert have a "Description of a new Scorpenoid fish, *Sebastichthys proriger*, from Monterey Bay;" a "Description of a new Agonoid, *Agonus vulsus*, from the Coast of California" and a "Description of a new species of Paralepis, *Paralepis coruscans*, from the Straits of Juan de Fuca." Mr. S. I. Smith gives a "Preliminary notice of the crustacea dredged in 64 to 325 fathoms, off the South Coast of New England, by the United States Fish Commission in 1880.

I only wish I could persuade all who hear me to study and practice the art of angling. You have no idea how differently you would regard life. Generally, it works a happy change in the gloomy and morose, and gives the invalid a new lease on life.

THE RHODE ISLAND COMMISSION.

THE tenth annual report of the Commissioners of Inland Fisheries of Rhode Island tells us that the catch of scup (porgie of New York), *Stenotomus argyrops*, in the traps this spring was not as large as usual, but that the prices were better, and the fishermen received a fair price for their labor. On the subject of trap fishing the commissioners hold the same views expressed in their last report, in which they recommend that the line established from Narragansett Pier to Seaconnet Point be abolished, and the whole coast line protected, and that heart-nets or pounds should be licensed. Fish have been plentiful, especially scup of large size, tautog or blackfish, young bluefish and squetague or weakfish, and this is attributed to the two causes, first, the close time, and second "an exceptionally abundant season for these sorts of fish, due to favorable circumstances at the spawning season, etc."

The scarcity of bass, for which Newport's shores are famous, is accounted for by the use of traps, which are the means of catching the fish by the thousands when they only weigh from one half to three and four pounds each. There are invested in this State by persons residing here $177,300 in works, steamers, boats, etc., giving employment to 334 men. In the menhaden fishery there are 246 men who depend upon fishing for their support during the whole year, of whom forty-three are interested in heart nets. Exactly why this small number of individuals should be allowed year after year to deplete and almost ruin the fisheries the Commissioners fail to see and, in their capacity as Commissioners, they earnestly beg that the General Assembly will enact such additions to the fishery laws as they suggest. The Commissioners find that there are a number of individuals, non-residents of the State, who carry on the manufacture of fish oil and guano and heart seining, to say nothing of lobster catchers

The Commissioners desire to call the attention of the General Assembly to the very important question of the lobster fishery in Rhode Island waters. Maine, Massachusetts and New York have seen it to protect themselves, and it is more than time that the State of Rhode Island followed their example. The lobster law of Massachusetts forbids the sale of lobsters less than ten and one-half inches in length. The capture of small lobsters has gone on in Rhode Island since the first lobster pot was put in Rhode Island waters. The larger ones are sent to market and the smaller are used for bait for blackfish. Very many men eke out a living with their lobster pots. For a number of years past the catch of lobsters has been steadily decreasing, not as to numbers, but as to size. They commenced the passage of a law forbidding the sale of lobsters less than twelve inches in length, and suggest that it would be advisable to forbid the sale of female lobsters loaded with spawn. So far as the limit of size is concerned, the Commissioners are assured that the law will be most popular. To show the value of the lobster fishing they state that one man in this city handled $20,000 worth during the past year.

The Commissioners have received a consignment of 200 carp from Prof. Baird, the United States Commissioner.

DAMAGE TO THE SALMON BREEDING RANCH.—In addition to our notice of the almost complete destruction of the Government buildings on the McCloud River, Cal., in our last, we print the following from the San Francisco *Bulletin*:

To persons who have visited the United States Fishery the height of the water will be appreciated when it is stated that it completely covered the Indian burial ground on the hillside in the rear of the buildings. The floating boats containing the water wheel which supplied the hatchery with water from the river were saved, they having been chained to trees. The cost of the buildings and works destroyed, it is represented, was from $20,000 to $25,000. At the time of their construction all the lumber had to be obtained from saw-mills near Mount Shasta. It is claimed that they can be replaced now for $12,000 or $15,000.

It was from these works that the salmon eggs have been obtained and hatched for stocking the Sacramento and other rivers. Through the facilities there offered by the United States Government the State has placed annually two million salmon in the Sacramento River, at an expense not exceeding $1,000 for each million.

The catch of salmon in the Sacramento River has in consequence doubled within the past five years, having risen from five million pounds to nearly eleven million pounds.

The following letter from the young man left in charge of the property to a friend in this city gives some of the details of the effects of the flood:

UNITED STATES FISHERY,
BAIRD, Shasta County,
February 4, 1881.

"DEAR SIR: To-day I send you a few lines to let you know how we stand up this way.

"As I told you in my last we were expecting another great storm. Well, it came January 30, and the river that night rose thirteen feet, but went down next day. The day after it commenced raining worse than ever, and that night about 9 o'clock had risen twelve feet six inches, when Dick Hubbard and I burst in the doors to Mr. Stone's private rooms, and took out all the boxes, etc. At 11 o'clock all the houses were two feet under water, and rocking fearfully. At 2 A. M. they were all swept down the stream. The dwelling-house, the kitchen, bunk rooms, store house, wood shed, in fact, all the houses went.

"The remainder of the night we spent in Green's house (post-office) down the road.

"In the morning this house stood three feet under water, but did not go down the stream. I saved all the postage stamps and stamped envelopes, but the two mail bags and letter stamps were lost. What shall I do about them?

"You remember the gray rocks opposite, and where the new trail was made last summer, well, the water rose above there. This will show you how high the river was—probably thirty feet.

"I lost all my clothes except a new coat, and a suit that I had on at the time.

"What shall I do now? Shall I remain and take care of the chickens, for they are all that is left, pretty much?"

Fish Commissioner B. B. Redding has telegraphed to United States Senator Booth to endeavor to secure the passage of an appropriation by Congress to defray the cost of rebuilding the hatchery. Mr Redding thinks if the Legislature were to pass a joint resolution asking Congress for such an appropriation it would help its passage.

ICHTHYOLOGICAL NOTES.

WE have received a part of the "Proceedings of the National Museum" in which are "Descriptions of two new species of Scopeloid fishes, *Scutis virgens* and *Myctophum crenulare*, from Santa Barbara Channel, California," by D. S. Jordan and C. H. Gilbert. The former differs from Gunther's *S. hyalina* chiefly in the dentition, canine teeth being present on the premaxillaries and palatines. The latter fish belongs to Gunther's genus, *Myctophum*, the *Scopelus* of Reinhardt. Jordan and Gilbert also describe two new flounders, *Paraphrys ischyrus* and *Hippoglossoides elassodon*, from Puget's Sound; seven new *Sebastoids*, which renders a revision of the family necessary in order to accommodate them, and which latter is proposed; a new *Embiotocoid* (*Abeona aurora*) from Monterey Bay; a new flounder, *Platysomatichthys stomias*, from California, and an *Embiotocoid*, (*Cymatogaster rosaceus*) also from California.

Mr. W. N. Lockington gives a "note on a new flatfish, *Lepidopsetta isolepis*, found in the markets of San Francisco." Prof. Jordan writes a "note on a forgotten paper of Dr. Ayres and its bearing on the nomenclature of the Cyprinoid fishes of the San Francisco markets;" a "note on 'Sema' and 'Dascentrus.'"

Jordan and Gilbert have a "Description of a new Scorpenoid fish, *Sebastichthys proriger*, from Monterey Bay;" a "Description of a new Agonoid, *Agonus vulsus*, from the Coast of California" and a "Description of a new species of Paralepis, *Paralepis coruscans*, from the Straits of Juan de Fuca." Mr. S. I. Smith gives a "Preliminary notice of the crustacea dredged in 64 to 325 fathoms, off the South Coast of New England, by the United States Fish Commission in 1880.

THE MCDONALD FISHWAY.—On the 9th of this month the Virginia Legislature passed an act obliging all persons owning dams in Rockfish River to interfere with the free passage of fish, to provide a suitable fish ladder, known as the McDonald Fishway, so that fish may have free passage up or down the streams during the months of March, April, May and June of each year; and it shall be required of such parties that the same shall be restored in case of destruction, and shall be kept in good repair; and in case they refuse to construct sluices, slopes or ladders as required, they shall forfeit five dollars for each day they so refuse. It is the duty of the supervisors of counties at least twice a year, in the months of April and October, to examine and see that the law is complied with.

STRIPED BASS IN CALIFORNIA.—About a year and a half ago Messrs. Throckmorton and B. B. Redding secured three hundred bass spawn from the waters of New Jersey and transplanted them in the Straits of Carquinez, near Martinez. Last year a bass was caught in those waters, weighing one pound. Yesterday, a bass weighing four pounds and measuring twenty inches in length and seven inches in width, attracted attention at the California Market, having been caught in the ocean, off Bolinas. Mr. Redding sent a message offering $5 for the fish, but it had already been secured by D. J. Staples, who intends to present it to the Academy of Sciences, where it will be officially examined and scheduled.

[The above is from the San Francisco *Alta*, of February 26. We happen to know that the bass referred to were striped bass, or rockfish, *Roccus lineatus*, although the heading of the article, "California Bass," did not convey the information. They were not "spawn" when taken, but "fry" three inches long. Properly speaking, "spawn" are eggs, although in some parts young fish or "fry" are termed spawn.]

GERMAN FISH CULTURE.—The *Fischerei Zeitung*, of Stettin, says: "We learn that M. R. Eckardt, of Lubbinchen, has this spring artificially multiplied the pike (*Esox*) in his earnest efforts for fisheulture. There is great need of the propagation of this fish in certain districts; it grows rapidly, as proven by the fact that some which M. Eckardt impregnated on the 13th of March and examined on the 15th of October, in the same year, weighed over one pound—a most wonderful growth, proving this fish a valuable acquisition. Mr. Eckardt will investigate the breeding of the Zander (pike perch, *Stizostedion*), which has hitherto been neglected. After this he will devote his attention to the seuding of the impregnated eggs of the different varieties of carp, as the scale, leather and mirror carp spawn and fry, and in the month of May will send a large package of them to America.

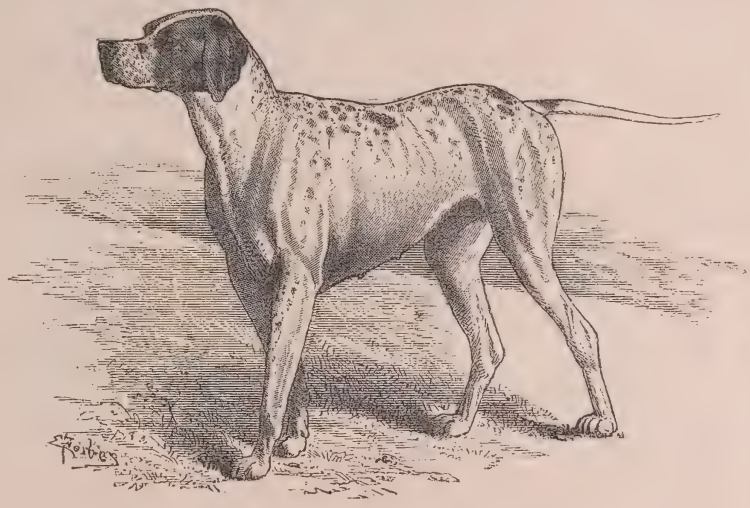
SALT IN TROUT PONDS.—Mr. J. Annin, Jr., of Caladonia, N. Y., says that last fall and winter he used three barrels of salt in one of his breeding ponds with the very best results. He found that he lost but very few fish from any disease, but more especially from fungus, which in many cases starts from the handling while spawning, and he thinks it helps the trout in many ways. They look cleaner, and after a little appear to like it, for after throwing it in the pond they would run in among it, also rub themselves in it. It also helps very much to clean the bottom and sides of the pond of any unclean matter. He recommends the dose of ten or fifteen pounds of salt every two or three days during the fall and spawning season. The fish would be the better if it was continued during the year. If the pond is larger, use more. The pond spoken of was about 10x14ft., 3½ft. deep.

AMERICAN FISHCULTURAL ASSOCIATION.—The annual meeting of the American Fishcultural Association will take place on Wednesday and Thursday, March 30th and 31st, 1881, at eleven o'clock, in the rooms of the Directors of the Fulton Market Fish Monger's Association, foot of Beekman street, New York.

B. PHILLIPS, Secretary. B. B. ROOSEVELT, President.

The Kennel.

CHAMPION RUSH.



WE present to our readers in this issue a picture of Mr. Edmund Orgill's champion small sized lemon and white pointer Rush. This dog is so well known to the sportsmen of this country, having been so frequently and successfully exhibited, that further comment would appear unnecessary. He has achieved the reputation of being the typical small pointer dog in America. In breeding both for field and form his pedigree would be hard to beat; coming on the dam's side, Lilly, from a noted strain of field dogs in Tennessee that were considered second to none in that section, possessing extraordinary nose and great endurance. On the sire's side, Flake, he is equally good. Flake was bred by Dr. A. Russell Strachan, of this city, and was descended from the most noted kennels of England, being a grandson of George, who was bred in the Duke of Beanfort's kennels, and especially chosen for Sir Frederick Bruce, who was then Minister from England to the United States, and from whom Dr. Strachan obtained him. This gentleman has a fine life-size painting of George, executed by Bispham which he is always pleased to show to his sportsmen friends. George also figures in the group of three dogs pointing quail, painted by Bispham for Dr. Strachan and which has been so extensively chromoed all over the country. He was a very stylish, compact looking dog, weighing about sixty pounds, and was the sire of Dr. Strachan's Flash, who was the sire of Flake, who, probably, was the most handsome small pointer ever exhibited in America. Flake when a puppy was presented by Dr. Strachan to Mr. William F. Steel, of Piermont, N. Y., for whom the Dr. had a great admiration, believing him to be one of the very best dog handlers he had ever known, combining patience, firmness, gentleness and the judgment which culture brings in an eminent degree, and it was under Mr. Steel's care that Flake developed into the fine dog he was when first exhibited at the Westminster Kennel Club's first show, winning first in his class and running second to Snapshot for championship, although acknowledged by Mr. Macdonna (who brought out Snapshot) to be as handsome a small pointer as he had ever seen.

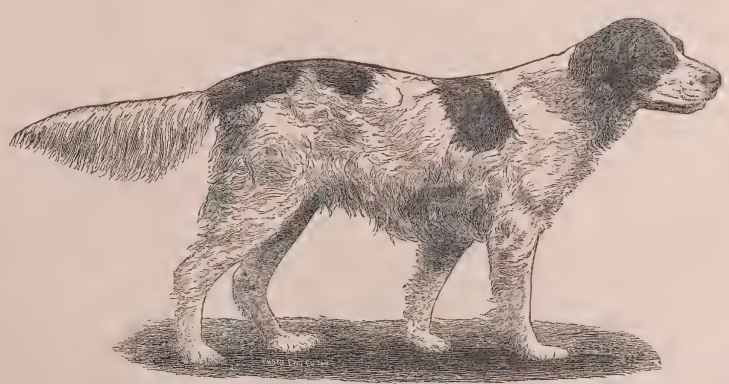
Dr. Strachan seeing Lilly for the first time at the Lincoln Show, strongly urged Mr. Orgill to breed her to Flake; he followed the advice and the result was one of the finest and most successful litters ever born—three of the progeny at least becoming champions, namely, Rush, Daisy and Rose. So much for good breeding. Flake and Lilly were indeed a beautiful brace, and from this union Mr. Orgill had the gratification of establishing that strain of pointers so familiar to small pointer admirers.

The subjoined list shows the prize winnings of Rush:

1877—Baltimore—Puppy class, second prize: his litter sister, Rose, taking first prize.
1877—New York—Open class, under 50 lbs., first prize.
1887—St. Louis—Open class, under 50 lbs., first prize.
1877—Louisville—Open class, under 50 lbs., first prize. Also special prize for best pointer in show; also special for best pointer under 50 lbs.; also special for best pointer under eighteen months of age.
1879—St. Louis—Champion class, under 55 lbs., first prize; also special for best pointer in show.
1879—Philadelphia—Champion class, under 55 lbs., first prize; also special for best pointer in show.
1880—New York—Champion class, under 55 lbs., first prize; also special for best pointer in show.
1881—Pittsburgh—Champion class, under 55 lbs., first prize; also special for best pointer in show.

In addition to the above Rush has won several prizes in brace and other kennel shows.

MR. ORGILL'S POINTER RUSH.



NORNA.

WE publish on this page the portrait of the imported field trial setter bitch Norna, owned by Mr. James H. Goodsell, of this city. Norna is a beautiful bitch, black, white and tan in color. She was bred by Mr. R. Lloyd Purcell Llewellin, by whom she was sold to Mr. Cunnington. This gentleman being obliged to give up shooting owing to ill health, sold Norna to Mr. A. H. Moore, of Philadelphia, from whom she was purchased by Mr. Goodsell.

Norna is out of Mr. Llewellen's Nellie, by his Dan. She thus traces her blood back through some of the most celebrated of Mr. Laverack's prize and field trial winners to Ponto and Old Moll. Dash II, her grandsire, was the sire of more winners on the bench and in the field than any dog that ever lived. Among them were Llewellen's Countess, Prince and Nellie, Garth's Daisy, Bayley's Victor and Clara, Wardlaw Read's Sam, Pilkington's Dash, Laverack's Cora, Field's Bruce, and many others equally well known. Mr. Raymond's Pride of the Border and Fairy were also by Dash II. It is hard to say whether this great dog was most celebrated as a prize winner or as a sire of winners. Moll III, the granddam of Norna, is as famous as a mother as Dash II. is as a sire. She is the mother of Llewellin's Countess, Prince and Nellie, Bayley's Victor, Garth's Daisy, Read's Sam, Raymond's Fairy, Blinkhorn's Victress and Scott, Dickens' Belle, Laverack's Cora, Llewellin's Daisy, and many others.

Dan, the sire of Norna, is so well known to our readers as to need no long encomiums. In field trials he won first in the Bradford Stakes at Shrewsbury in 1871, and first in the Bruce Stakes with his brother Dick at the same time and place; he also won the champion at Shrewsbury in that year. He has never been beaten in a competition in the field. Old Duke and Rhoebe, the sire and dam of Dan, are especially well known as field trial winners, and Rhoebe is often spoken of as the founder of the field trial strain of setters. In the four years from 1870 1873, inclusive, the National Field Trial Champion Plate was won by Bruce and Rob Roy, her sons, and by Daisy, her granddaughter. She was the mother of many field trial winners.

It will thus be seen that on both sides Norna comes from a race of winners, and no doubt we shall hear of her or her progeny in coming field trials on this side of the water.

MR. GOODSELL'S SETTER BITCH NORNA.

WANTED, A WOODCHUCK DOG.

EDGEMONT, Delaware Co., Penn.

"DEAR SIR—The farm is overrun with ground-hogs (woodchucks). Last season it was bad enough—this year it will be worse, as none were destroyed. They swarm all over the county and are becoming a positive pest. Their holes are in every field, and it is no longer safe to run the mower without first going over the ground to stake or mark the holes to prevent injury to the team, for if a horse steps into a "hog hole" there is a good chance of breaking a leg.

"What are we going to do about it? We can't poison the little brutes, for they eat nothing but vegetable food and prefer growing clover to anything else. I suppose Paris green sowed over the clover when the dew is on would do the business, but it would scarcely be healthy for the cattle. So that won't do. Shooting I have tried; it is 'mighty long between shots.' They know all about it and won't show a nose above ground after the first shot. Our farm dog can't catch them outside, and he is too big to go down the hole and drive them out.

"Is there any breed of dog small enough to go down a hog hole and with pluck enough to stay there until he drives the 'varmint' out?

"If there is such a breed I want it, and so do my neighbors.

"B. W."

The foregoing letter from a farmer friend recites a real grievance, so I have taken the liberty of forwarding it to you to place before the readers of the FOREST AND STREAM.

And now, as to the kind of dog needed. Small size is the first requisite, else he cannot enter the burrow. Next comes gameness, for the groundhog is a sharp biter and makes a brave fight when in his stronghold. The next requirement is ability to punish the vermin and make his quarters so hot that he will bolt out.

Now, what breeds that are available in this country fill the bill? The Skye will not answer—he carries too much coat; of a hot summer day, underground work would almost stifle him and in wet weather he would be loaded with mud. Dandies would answer, I have no doubt, but no one breeds them here. Fox-terriers would seem to be the dogs indicated, as their coats are right for the work, their size suitable and they have the necessary gameness.

They are classed at our bench shows as a sporting dog—why, I never could exactly understand, as no legitimate field work is offered for them; but if they answer for this they will earn the name—and the blessing of every farmer in this region.

Will the breeders of fox-terriers take up this subject in your paper and let us know if the dog has been used in this line and if he has proved a workman?

If such are the facts, we will see the fox-terrier take the place of the farm cur, and the breeding of these dogs will receive a fresh impulse, as the demand for them in agricultural districts will be almost unlimited. LEPUS.

THE EARLY BRITISH DOG.—Dogs are frequently found represented on the Romano-Keltic pottery of England, especially on Durobrivan ware. These dogs commonly fall under one of two types—they are large and fierce, like our present bulldogs and mastiffs, or they resemble a fleet, slender hunting dog, such as our greyhound. By comparison of the forms still remaining at the different museums on pieces of pottery some particulars might be obtained respecting the various breeds of the early British dog, if we could be sure that the artist did not use conventional or imaginary types of dog life. At this point the well-known passages in the classics which refer to the excellence of the English dogs come in. The larger and fiercer kinds were much employed both by the Roman sojourners in Britain and their countrymen at home in chasing the wild boar. Shepherd dogs, too, may have been needed to tend the *magnus numerus pecorum*, of which Cæsar speaks, in our island. The luxury of the Roman capitol at York would be almost certain to demand the smaller breeds of pets.—*The Antiquary.*

THE PURE LAVERACK SETTERS IN ENGLAND.

BY "LEATHERHEAD."

IN consequence of the very unceremonious way in which the name of "Laverack" was made use of by advertisers and those who wanted to sell setters, I determined three years ago to collect a list for *Bell's Life* of all the setters that could be proved to be purely bred from the strain mentioned and described by Mr. Laverack in his "Book of the Setter." This list, I believe, had some effect in warning people that setters, because they were called Lavcracks, were not necessarily of that breed, and I know in some cases, when proof has been asked for, it has been wanting, and that the dogs advertised as such had no more pretentions to be called Laversacks than Hereford cows had to be called Short-horns. In my original list I know I was thought crotchety for not admitting some that were undoubtedly very closely related to Laverack, but the sequel has proved, I think, that I was right, as, in closely breeding to the strain, others might have an equal right to claim purity by the admission even of one cross; and if that was allowed the result would ultimately follow of having the pure Laverack blood, such as we can fairly consider it, stamped out. A cross, however remote, would not be allowed as thorough bred even in the "Stud" or "Herd Books," and as there are very good proofs that the Laveracks belong to an old and distinct family of setters, I think that on every principle of breeding it should be guarded in just the same degree as any other specified breed. I know I shall be met with the argument that other setters are a good, but that is beside the question, and must remain as a matter of opinion, it being only remarkable that just as ordinary horses are improved in their generation by being crossed with thorough-bred sires, and all cattle are improved by crosses to the short horn, so has every sort of English setter been improved by a judicious with the Laveracks. It might be well imagined that the Laverack could be improved, but I maintain that there has been a total want of proof in this direction; as granted that a cross bred animal may be as beautiful as a pure one, and be as perfect, in every particular, the proof that such merit is permanent must be tested by future breeding, such as breeding a cross bred animal to a cross bred; and as regards setters, has that been successful either in this country or America? I think not, though doubtless other strains have been improved by Laveracks, and those bred into the Laveracks again, have as a matter of course continued to improve. All setter breeders if they will really acknowledge their true convictions, will, I think, corroborate me in this opinion. At any rate, if the show lists and Field Trials for the last three years are examined, it will be found that Laveracks have had a good deal to do with success, as with the exception of old champion Ranger, nothing less than a half Laverack has won at a Field Trial or a large show. The victories of the pure ones have been limited, simply because they are very scarce, and as regards Field Trials, those who own them have not been as a rule the habitual patrons of those pastimes. In America it would appear that last season was very nearly the first year that our Transatlantic cousins had tried running the pure ones, and, by-the-by, of their own breeding. The success that followed the breed last autumn was almost remarkable, as Thunder, a pure bred one, and his daughter Daisy Laverack, also pure, were well in front for every contest they engaged in, the younger being second in the American Field Trial Derby. At New York, and also at Philadelphia, the pure Laveracks were very prominent in the prize list, and in England they have not been behind either, as out of seven prizes at Birmingham the pure ones took five, and at the Alexandra Palace, two out of ten. This is against long odds, it must be recollected also, as the half and three-parts bred ones outnumber the pure ones by at least thirty to one. They are not plentiful, for as my appended list will show, the number of owners having both dogs and bitches is extremely limited, and, as good representatives of the breed are expensive to purchase, there are many people who have a partiality for the family, but with purses not sufficiently long to get dogs and bitches bred far enough away to breed to, and then as a matter of necessity the progress in forming a kennel is very slow. The possession of a good bitch is almost better than owning a dog, as blood can be hired or borrowed, but those owners in my list are the most fortunate who own representatives of both sexes at a sufficient distance in their breeding to allow a continuation of the policy to breed pure.

Beginning with the dogs, I find I can give a longer list than I could three years ago, although there are several death vacancies, the notable ones being Blue Prince, Mr. Llewellin's Prince, Major Platt's Dash and Mr. Sim's Dash. Others are also getting old, although from recent inquiries I hear that they are fresh and well, and so precious is the blood of some of them that they should be bred to as long as there is a chance of getting produce. With these few preliminary remarks I give a list of all the pure Laverack dogs that are known to be in England above the age of nine months, and I have taken some time and trouble to make it as authentic as possible.

Mr. Daintry's Hollin's bl bel Warwick, by Tam O'Shanter out of Pearl; whelped 1878.
*Mr. Daintry Hollin's bl bel Styche, by Basto out of Rum; whelped Jan, 1880.
*Mr. R. Purcell Llewellin's bl bel Prince Royal (K. C. S. B., 7,165,) by owner's Prince out of Lill II.; whelped 1875.
*Mr A. P. Heywood Lonsdale's liv w Fred V. (K. C. S. B., 7,151,) by Blue Prince out of Dickens's Belle; whelped 1876.
*Mr. A. P. Heywood Lonsdale's bl bel Blue Boy, by Blue Prince out of Cora; whelped 1877.
Mr. G. Lowe's bl bel Tam O'Shanter (K. C. S. B., 6,118), by Rock out of Rum; whelped 1876.
Mr. T. Pilkington's bl bel Dash (K. C. S. B., 1,342,) by old Dash out of Lill; whelped 1870.
Mr. T. Pilkington's bl bel Scott (K. C. S. B., 1,440,) by old Dash out of Moll; whelped 1870.
Mr. J. Robinson's lem w Emperor Fred (K. C. S. B., 9,077,) by Tory or Blue Prince out of Daisy; whelped 1877.
Mr. J. Robinson's Rumford, by Emperor Fred out of Welcome; whelped May, 1880.
Mr. J. Robinson's Glen Tilt, by Rock out of Daisy; whelped April, 1880.
Mr. S. E. Shirley's lem w Lad of Ayr (K. C. S. B., 9,035,) by Tam O'Shanter out of Breeze; whelped 1879.
Mr. S. E. Shirley's bl bel Robbie Burns (K. C. S. C. B., 9,105,) by Tam O'Shanter out of La Reine; whelped 1879.
Mr. T. Statter's bl bel Galopin, by Tam O'Shanter out of La Reine; whelped May, 1880.

There are several noted vacancies in the list of pure bitches within the last three years, notably Mr Llewellin's Nellie, the dam of Bandit; Cora, the dam of La Reine and Daisy; Mr. 'Bayley's Clara, Mr. Daintry Hollin's Silk and Dickens's Belle. All the above bitches, with the exception of Silk, by Pride of the Border out of Dickens's Belle, were by Old Dash out of Moll, and therefore sisters to Victor, Mr. Llewellin's Prince and Mr. Pilkington's Scott, and the only Dash, and Moll bitch alive now is Mr. Daintry Hollin's Rum, the dam of Tam O'Shanter, Rogue, Shot, Prince and Styche, named in the above list. There has been an apparent reluctance on the part of breeders to dispose of pure Laverack bitches, as I have only heard of four such importations abroad in three years—a sister to Warwick, to Germany; two sisters to Robbie Burns, to America, and a bitch by Bandit out of Royal Romp, to New Zealand. Our American friends had Pride of the Border Carlowitz, Fairy and Petrel before that time, and by all accounts they have done pretty well on the other side of the Atlantic. Two or three dogs have been secured for the United States, and there is more than one commission about for bitches at this moment, though I do not know where they are to be found, as breeders, whether they cross at all or keep the strain pure, invariably like to keep the pure bitches as the most likely sort of foundation. To speculate for the future when distemper and unknown sorts of complaints spread such havoc in kennels is rather hazardous, but I can mention some likelihood of more of the breed appearing by stating that Mr. Grant's bl bel Rose has five puppies three weeks old by the above-named Tory, that Mr Douglass Duncan's Blue Belle had six puppies last Monday to Tam O'Shanter, and that Mr. Shirley's Breeze and Rummage are both heavy in whelp, the first to Robbie Burns, and the latter to Lad of Ayr. Mr. T. Pilkington has also three puppies over six months old, by Jock out of Blue Belle II., and Mr. Daintry Hollins has four, five months old, by Troy out of Rum.

The following is a list of pure bredLaverack bitches:

Mr. T. B. Bowers's lem w Royal Lill (late Norah) (K. C. S. B., 9,152,) by Scott out of Lill; whelped 1874
Mr. T. B. Bowers's bl bel Royal Romp, by Rock out of Rum; whelped 1876.
Mr. T. B. Bowers's liv w Maid of Honor (K. C. S. B., 9,145,) by Blue Prince out of Silk; whelped 1876.
Mr. T. B. Bowers's Royal Flirt, by Emperor Fred out of Royal Romp; whelped May, 1880.
Mr. Douglas Duncan's bl bel Blue Belle II., (K C S. B., 6,127,) by Bandit out of Blue Belle I, sister to Fletcher's Rock; whelped 1875.
Mr. Douglas Duncan's bl bel Royal Jess (late Jess II.,) K. C. S. B., 6,136,) by Mr. Pilkington's Dash out of Mr. Reid's Jess.
Mr. Freme's bl bel Belle, by Comet out of Royal Romp; whelped 1879.
Mr. H. Grant's liv w La Reine (K. C. S. B., 6,138,) by Blue Prince out of Cora; whelped 1876.
Mr. H. Grant's bl bel Meg Merriles, by Tam O'Shanter out of La Reine; whelped 1879.
Capt. C. J. N. Grey's bl bel Jess III., by Mr. Pilkington's Dash out of Mr. Reid's Jess.
Mr. Daintry Hollin's bl bel Rum (K. C. S. B., 1,555,) by Old Dash out of Moll; whelped 1871.
Mr. Daintry Hollin's bl bel Ada, by Rock out of Rum; whelped 1876.
Mr Daintry Hollin's liv w Silk II., by Blue Prince out of Silk; whelped 1876.
Mr. Daintry Hollin's liv w Pearl, by Blue Prince out of Silk; whelped 1876.
Mr. R. P. Llewellin's liv w Whitchurch Bess, by Blue Prince out of Cora; whelped 1876.
Mr. Llewellin's bl bel Phantom (K. C. S. B., 5,078,) by Prince out of Lill; whelped 1873.
Mr. Llewellin's bl bel Puzzle (K. C. S. B., 6,147,) by Prince out of Lill; whelped 1875.
Mr. Llewellin's lem w Princess (K. C. S. B., 5,081,) by Prince out of Lill; whelped 1873.
Mr. G. Lowe's bl bel Belle of the North, by Jock out of Dickens's Belle; whelped 1878.
Mr. T. Pilkington's br w Daisy (K. C. S. B., 8,201,) by Dash out of Lill; whelped 1875.
Mr. T. Robinson's bl bel Blue Cora (K. C. S. B., 9,120,) by Blue Prince out of Cora; whelped 1879.
Mr. J. Robinson's bl bel Daisy (K. C. S. B., 6,131,) by Blue Prince out of Dicken's Cora (Dash and Moll); whelped 1873.
Mr. J. Robinson's bl bel Welcome, by Emperor Fred out of Blue Cora; whelped 1878.
Mr. J. Robinson's bl bel Symbol, by Emperor Fred out of Blue Cora; whelped 1879.
Mr. J. Robinson's bl bel Lucid, by Sim's Dash out of Maid of Honor; whelped 1879.
Mr. S. E. Shirley's lem w Breeze, by Tory or Blue Prince out of Robinson's Daisy; whelped 1877.
Mr. S. E. Shirley's bl bel Rummage, by Rock out of Rum; whelped 1876.
M. T. Statter's lem w Gaylass, by Tam O'Shanter out of La Reine; whelped May, 1880.
Mr. Van Wart's Nellie (K. C. S. B., 9,151,) by Bandit out of Jess II.; whelped 1878.

*Are not at the pubhc stud.

—*Bell's Life.*

THE BENCH LEGGED BEAGLES.—In Mr. Pottinger Dorsey's very interesting article referring to the ancient breed of the bench-legged beagles, published in our last issue, our printer makes him say "*for fox* hunting purposes" the word *fox* should have been left out as Mr. Dorsey and his friends do not use the beagle for foxes.

THE FIELD TRIALS DERBY.—The following entry is in addition to those published in issue of March 10.

Mr. D. C. Sanborn enters Gertrude, white, black and tan bitch, whelped June 4, 1880, out of Nellie by Gladstone.

JOSEPH H. DEW, Secretary, N. A. K. C.

NOTICE TO COCKER OWNERS.—Mr. F. F. Pitcher, Riverside Cocker Spaniel Kennel, Claremont N. H., requests us to give notice that he purchased last autumn Mr. S. J. Hestor's kennel of cockers, and that all inquiries regarding this stock should be addressed to him as above.

THE COCKER CLUB.—The following communication has been handed us for publication: The committee will meet on Wednesday, March 30, at 3 o'clock P. M., at Buffalo, N. Y. On the part of the club I beg to thank the Forrester Gun Club, of Buffalo, for their kindness in allowing us the use of their club rooms for the meeting.—GEO. D. MACDOUGALL, Secretary.

LOST.—On Saturday, the 19th, about 3.30 P. M., some one walked off with my cocker spaniel bitch Flirt II. She was chained in the basement of No. 43 New street, and during my absence was stolen. Flirt is all liver colored, weight about 24 lbs, is very thin and in poor condition, having just recovered from a severe illness. Her left eye was badly inflamed—in fact, I brought her to the city to show her to a veterinary surgeon. She is rather timid in disposition, and had on when lost a brt colored undressed leather collar with a loose ring in it. Any fellow dog lover can give me information as to her whereabouts he will earn my lasting gratitude, which will take the substantial form of a puppy of her next litter by Benedict. GEO. D. MACDOUGALL.

Whitestone, L. I.

DEATH OF ROMP.—We learn with regret of the death of this well-known pointer bitch who was recently shot by a band of gypsies who said she was mad, near Memphis, Tennessee. Romp was owned by Mr. H. McComb, of Memphis, and was brought North about three years ago by Mr. Edmund Orgill to be bred to Rush. She whelped two litters to him, and was then sent South. Romp was lemon and white in color, and weighed about 60 lbs. She won first at Baltimore in the open class, and 3rd in the champion class in 1879 in this city. She was the mother of a number of good dogs among whom was Rocket

Romp was imported from England and her pedigree ran back to Hamlet.

NEW YORK DOG SHOW.—The following is the assignment of judges to the different classes: Major J. M. Taylor, English setters, Irish setters and beagles; Hon. John S. Wise, black and tan setters, Scotch deerhounds, greyhounds, foxhounds, Italian greyhounds and miscellaneous; Mr. S. T. Hammond, pointers; Dr. Niven, collies, spaniels, fox terriers, dachshunds, bulldogs, bull terriers, Skye terriers, Dandie Dinmont terriers, Irish terriers, Yorkshire terriers and pugs. No one has as yet been appointed to care for the bloodhs, St. Bernards and New Foundlands. A special class has been established for Berghunds at the request of intending exhibitors. The management has refused to open a special class for bench-legged beagles, although numerous requests from prominent breeders of that strain have been received. In addition to the prizes offered by the Westminster Kennel Club, for dogs that have never been placed in any field trials in America, a medal will be given in this connection for Black and Tan setters, by Mr. Fred A. Pulsifer, and doubtless by eater Dorr, a winner in Nebraska trials, 1880; and Dr. Aten, Glen

DON JUAN.—The steamship City of Berlin which arrived in this port on March 13 had on board the magnificent Laverack setter dog Don that the late purchase of Mr. James H. Goodsell, of this city. Don was consigned to the well-known forwarding agent, Mr. E. B. Goldsmith, who was on hand to receive and send him to Goodsell's residence at Orange, N. J. Although he arrived in fine condition he has much improved in appearance since he has had the run of his owner's grounds. Don was whelped August 8, 1879, and was recently purchased by Mr. Goodsell from his breeder, Mr H. F. Grant, Newport, Isle of Wight, England. The pedigree of this fine animal is unexceptionable, he being by Tam O'Shanter (K. C. S. B., 6,118) out of La Reine (E. K. C. S. B., 6,138). The sire, Tam O'Shanter by champion Rock out of Rum, she an old Blue Dash and Moll bitch. The dam La Reine by Blue Prince (Pride of the Border–Nellie) out of Cora, also a Dash and Moll bitch bred by the late Mr. Laverack. Don is a blue Belton, and in appearance, so writes his breeder, approaches his grandsire champion Rock more closely than any dog he has ever seen. Don's litter brother, Robbie Burns, a puppy when shown of only fifteen months old, was second at the last Birmingham show (the best show in England), beating a lot of crack prize winners. This was truly remarkable for so young a dog, it being his first showing. Leatherhead in writing of Don says that, "he is even a better and more blood-like animal than his brother Robbie Burns." We congratulate Mr. Goodsall on his acquisition of so fine an animal, one that is so full of quality in every way. Don will be entered at the coming New York show, and will then be placed in the hands of either Mr. Martin or Mr. Shook for breaking. From what we have seen of him we can say that his field action is superb, and, barring misfortunes, he will rank A1 with the best of pure Lavera cks in this country.

KENNEL NOTES.

*** Breeders and owners of dogs are invited to send memoranda of names claimed, bred, whelps, sales, etc., for insertion in this column. We make no charge for the publication of such notes; but request in each case the notice be made up in accordance with our form, that the name of both owner and dog be written legibly, or printed, and that the strain to which the animal belongs be distinctly stated.*

NAMES CLAIMED.

Princess Mix—Mr. H. J. Rice, Orchard Lake, Mich., claims the name of Princess Mix for black and white setter bitch, whelped December 13, 1880, out of Jolly May (Rob Roy–Dewdrop) by Druid.

Fern—Mr. W. H. Moller, Aiken, S. C., claims the name of Fern for his orange and white setter bitch puppy out of Mr. Campbell Moller's Belle by Mr. Frank Gozzens' Rumps.

Buckshot—Mr. Chas. W. Field, Brooklyn, N. Y., claims the name of Buckshot for his black and tan Gordon setter dog out of Mr. E. L. Miles' Topsy (Cherry-Skip) by Mr. Babcock's Sport, whelped January 12, 1881. Bred by Mr. E. L. Miles, Sag Harbor, N. Y.

Maud S.—Mr. Charles O. Brownell, Mount Pleasant Kennel, New Bedford, Mass., claims the name of Maud S. for Gordon setter bitch puppy, whelped November 20, 1880, out of his Chloe by his Dash.

J. E. B. Stuart—Mr. W. K. Kenan, Union Springs, Ala., claims the name of J. E. B. Stuart (Jeb for short) for puppy out of Breeze by Brewster, whelped May 10. John Rhodes, Ohio.

Bessie O'More—Mr. M. L. Norton, Greenbush, N. Y. claims the name of Bessie O'More for his red Irish setter bitch puppy, whelped May 31, 1880, out of Queen Bess (Goldsmith's Plunket–Nell) by Mr. W. N. Callender's Champion Rory O'More.

Covert—Mr. Everett Smith, Portland, Me., claims the name of Covert for all-red setter dog (dark eyes and nose), whelped November, 1880, out of Nell by Cale. With an inheritance of the fine field qualities of sire and dam, this dog should should prove a very superior "covert" dog for game.

Cossett Portland, Me., March 18.—I claimed this name for one of my setters in 1877, and now renew the claim for my orange and white setter bitch Cossett. This bitch has been bred in direct line from the setters once so well known in New England as the "Sargent setters." The original stock was selected on the moors for Gen. Sargent by an English gentleman for the best field qualities to be had. These dogs are characteristic of great staunchness, exceedingly fine nose, combined with beauty of form and coat, dark eyes and nose, orange and white color, that have been retained through many generations.

EVERETT SMITH.

Maud III.—Mr. B. W. Barlow, New York City, claims the name of Maud III. for his brindle greyhound bitch out of Maud II. by Spring.

Murad—Mr. J. A. Gargullo, New York City, claims the name of Murad for his white, liver and tan setter dog puppy, whelped November 27, 1880, out of Kate II. by Aldershot.

Adi—Mr. J. A. Gargullo, New York City, claims the name of Adi for his lemon and white setter dog puppy, whelped January 1, 1881, out of Patti by Aldershot.

Prince Mr. Walter L. Bennet, Milford, Mass., claims the name of Prince for his liver and white ticked pointer dog puppy, whelped December 30, 1880, out of Countess Nelly by Sam.

Spring—Mr. William H. Bennet, Milford, Mass., claims the name of Spring for dark liver colored pointer dog puppy, whelped December 30, 1880, out of Countess Nelly by Sam.

Sam's Prince—Mr. Charles White, Milford, Mass., claims the name of Sam's Prince for fawn colored pointer dog puppy, whelped December 30, 1880, out of Countess Nelly by Sam.

Shot—Mr. G. W. Myers, Pittsburgh, Pa., claims the name of Shot for dark liver colored pointer dog puppy, whelped December 30, 1880, out of Countess Nelly by Sam.

Tilley—Mr. J. W. Bay, Baltimore, Md., claims the name of Tilley for Gordon setter dog puppy out of Tilley's Dot by Tilley's Gordon, purchased through Mr. H. Malcolm, Baltimore, Md.

Count Rex Mr. Milton H. Lyons, Passaic, N. J., claims the name of Count Rex for his lemon and white pointer dog, whelped May 3, 1879, out of Daisy by Sensation.

Nelly—Mr. G. W. Myers, Pittsburgh, Pa., claims the name of Nelly for dark liver colored pointer bitch puppy, whelped December 30, 1880, out of Countess Nelly by Sam.

Boyne—Mr. Robert Reid, Philadelphia, Pa., claims the name of Boyne for his red Irish setter dog, whelped December 16, 1880, by Rory O'More out of Magenta. Purchased from Mr. W. N. Callender, Albany, N. Y.

Rivet—Mr. J. H. Winslow, Baltimore, Md., claims the name of Rivet for fox terrier dog thirteen months old out of Fanny by Forger. Rivet is white with evenly marked black and tan head, and arrived, March 3, from Liverpool, England.

Little Dorrit Mr. J. H. Winslow, Baltimore, Md., claims the name of Little Dorrit for white haired tox terrier bitch thirteen months old by Idol out of Dimple. Bred by Mr. C. Burgess, The Grange, Partney, Lincolnshire, England. Little Dorrit is white with black and tan mark on head and is a very game bitch.

Mayfair—Mr. A. M. Waddell, Louisville, Ky., claims the name of Mayfair for white and liver bitch puppy, whelped January, 1881, out of Blaze (Sam–Countess Bear) by Lincoln.

Jessie—Mr. David C. Frank, New York City, claims the name of Jessie for black and tan spaniel bitch, whelped March 12, 1880. Bred by Mr. R. M. Lindsay, Scranton, Pa. Sired by Bub out of Jenny they imported; by Brush out of Rea.

BRED.

Prim–Benedict—Mr. E. F. Beardsley's (Gouvernour, N. Y.) liver and white cocker bitch Prim to the Lachine Kennel Club's imported Benedict, March 18–19.

Daisy–Sensation—Westminster Kennel Club's pointer bitch Daisy to Champion Sensation, March 14.

Polly–Sensation—Westminster Kennel Club's imported pointer bitch Polly to Sensation, March 16.

Grace–Jack Mr. E. F. Mercilliott's lemon and white Laverack setter bitch Grace to Mr. E. F. Young's imported Laverack setter Jack.

Blix II.–Rush—Mr. S. W. Bode's (Baltimore, Md.) black and white pointer bitch Blix II. (Dr. H. J. Thomas' Blix–Brown's John) on March 9 to Mr. E. Orgill's Rush.

Bess–Perry's Peter—H. J. Perry's (Palmer, Mass.) setter bitch Bess (Lathrop's Dick–Gate's Clio) to Perry's Pete (Copeland's Pete–Queen Bess) March 14, 1881.

Maud S.–Dash—Mr. Chas. T. Brownell's Gordon setter bitch Maud S. to owner's dash.

Flirt–Captain—Mr. A. E. Godeffroy's cocker spaniel Flirt (imported Lou–Shot) to Mr. M. P. MaKoon's Captain.

Vinnie–Crexieth—Dr. Corcoran's (Springfield, Mass.) pointer bitch Vinnie (Ranger–Bess) to Mr. A. E. Godeffroy's Crexieth, March 12.

Lady–Barney—Excelsior Irish Water Spaniel Kennel Club's Lady to Champion Barney.

Queen of the River–Mike—Excelsior Irish Water Spaniel Kennel Club's Queen of the River to Mike.

Diamond–Shafto—Mr. J. H. Whitman's pure Laverack bitch Diamond to Mr. J. W. Blythe's pure Laverack setter dog Shafto.

Gipsey Girl–Jack II.—Mr. A. W. Bennett's (Fairmount Kennel) Hyde Park, Mass., St. Bernard bitch Gipsey Girl to Mr. W. A. Pierce's Jack II.

Lillie May–Caper II.—Mr. John L. Marton's pointer bitch Lillie May to his Caper II. (Sam–Countess Kate) on March 18.

Be-te-Grouse—Mr. A. S. Guild's setter bitch Belle to Mr. D. F. Waters's Grouse, February 10.

Nellie May–Clexton—Mr. J. H. Whitman's setter bith Nellie May (Blue Dash–Jolly May) to his Llewellin setter dog Clexton (Druid–Milly).

Jessie–Bruce—Mr. J. H. Whitman's imported Scotch deerhound bitch Jessie to his dog Bruce.

Gleam–Bob Mr. S. T. Hammond's (Springfield, Mass.) pointer bitch Gleam (Snapshot–Gipsey) to Mr. E. S. Wanzer's Bob February 16.

Fannie–Jo, Jr.—Mr. G. W. Campbell's (Carter's Creek Station, Maury Co., Tenn.) setter bitch Fannie to Joe, Jr., March 16.

Floss–Otto—Mr. G. W. Campbell's (Carter's Creek Station, Maury Co., Tenn.) Floss to Otto, March 14.

WHELPS.

Virgie—Mr. J. H. Whitman's Prairie Ranger bitch Virgie whelped seven puppies, six bitches and one dog, by Mr. John Davidson's Prince of Orange.

Pet—Mr. E. F. Mercilliott's (New York City) white and orange setter bitch Pet whelped Jany ary 24 seven puppies, five dogs and two bitches, all white and lemon, black points, by Mr. P. H. Morris' Czar.

Pussy—Mr. John Aspinwall's (Massena Kennels, Barrytown, N. Y.) beagle bitch Pussy whelped March 12 five puppies, three dogs and two bitches, by owner's Bunnie.

SALES.

Sam–Countess Nelly Whelp—Mr. John L. Marton, Milford, Mass., has sold to Mr. Walter L. Bennet, same place, a liver and white ticked pointer dog puppy, whelped December 30, 1880, out of Countess Nelly by Sam.

Sam–Countess Nelly Whelp Mr. John L. Marton, Milford, Mass., has sold to Mr. William H. Bennet, same place, a dark liver colored pointer dog puppy, whelped December 30, 1880, out of Countess Nelly by Sam.

Sam–Countess Nelly Whelp—Mr. John L. Marton, Milford, Mass., has sold to Mr. Charles White, same place, a fawn colored pointer dog puppy, whelped December 30, 1880, out of Countess Nelly by Sam.

Sam–Countess Nelly Whelp—Mr. John L. Marton, Milford, Mass., has sold to Mr. G. W. Myers, Pittsburgh, Pa., a brace dog and bitch, dark liver color, whelped December 30, 1880, out of Countess Nelly by Sam.

Jimmy Crow—Mr. J. H. Whitman, Chicago, Ill, has bought of Mr. J. W. Crippen the 20th, black and tan cocker spaniel dog Jimmy Crow, out of Flora by Carlo.

Daisy—Mr. J. H. Whitman, Chicago, Ill., has bought of Mr. W. A. Bridges, of Crete, Neb., the setter bitch Daisy, sister to his Pride and Judy, out of Dr. Parson's Fipp by Charm.

Jack Mr. C. Z. Miley, Lancaster, Pa., has sold to Mr. L. B. Robinson, Omaha, Neb., the red Irish setter dog Jack, out of Floss by Von.

Pearl F.—Mr. C. Z. Miley, Lancaster, Pa., has sold to Mr. R. G. Hall, Rockland, Maine, the liver and white setter bitch Pearl V., out of Russa, by Champion France, in whelp to Royal Ben (Carlowitz–Lucy).

Robin Hood—Mr. C. Z. Miley, Lancaster, Pa., has sold to Captain A. E. Woodson, U. S. A., Fort Laramie, Wy., the blue Belton setter dog Robin Hood, out of True by Carlowitz.

Royal Ben—Mr. George Davidson, Montreal, Canada, has purchased of Mr. C. Z. Miley, Lancaster, Pa., the setter dog Royal Ben (Carlowitz–Lucy).

Gipsy Queen—Captain E. E. Woodson, U. S. A., Fort Laramie, Wy., has bought of Mr. C. Z. Mily the setter bitch Gipsey Queen (Gladstone–Clip) in whelp to Count Royal (Druid–Leda).

Ponto—Mr. Burr Hollis, Hornellsville, N. Y., has sold to Mr. Opperman, Cleveland, Ohio, the liver colored spaniel dog Ponto, out of Fanny II. by Dash.

Quail—Mr. A. S. Guild, Lowell, Mass., has bought of Mr. Washington A. Coster the black and white setter bitch Quail, nine months old, by Gladstone out of Mr. Coster's Fly by Mr. J. B. Goodwin's Grouse Dale, winner of first prize at Robins' Island, 1879

Ed and Jack—Mr. E. F. Mercilliott, this city, has sold his brace of black setters Ed and Jack to Mr. Simon Johnson, Nevada City, Cal.

NAMES CHANGED.

Cartouche to Count Cartouche—Tilsonburg, Ont., March 5.—In FOREST AND STREAM of March 3 Mr. Frank B. Fay, of Boston, Mass., claims the name of Cartouche for setter puppy. I would ask Mr. Fay to change the name of his puppy, as I claimed this name some time ago for my lemon and white setter puppy out of Belle by Paris.

H. BAILY HARRISON.

Boston, Mass., March 14.—As Mr. Harrison has a prior claim to the name of Cartouche I will change the name of my setter puppy, out of Countess Gay by Colo, to Count Cartouche. FRANK B. FAY.

PRESENTATIONS.

Bunnie—Mr. Louis Livingston has presented to Mr. John Aspinwall, Massena Kennels, Barrytown, N. Y., the straight legged beagle dog Bunnie.

Pussy—Mr. Louis Livingston has presented to Mr. John Aspinwall, Massena Kennels, Barrytown, N. Y., the straight legged beagle bitch Pussy.

DEATHS.

Red Ranger—Mr. C. Spahr, Bridgeville, Pa., has lost by distemper his Irish setter dog puppy Red Ranger (b c at the Pittsburgh show, 1881) out of queen Bess by Rory O'More.

Snap—Mr. W. J. Percival, Palo, Mich, has sustained a severe loss in the death of his pointer Snap, March 18.

KENNEL MANAGEMENT.

99 W. S. P., Palo, Mich.—I have a beagle four years old. Five days ago he commenced to cough as though he had something in his throat and has coughing spells every day. He coughs hard and tries to raise something, but cannot. He is perfectly healthy and seems all right otherwise. Ans. If you cannot discover anything in the throat give him a dose or two of castor oil and feed very sparingly for a few days.

100 Q.—1. I have given the oil as directed and the cough has left him, but soon after he was taken with blood diarrhœa and passed almost clear blood, and would have passages every twenty or thirty minutes. He is better now, but does not seem well, nor has he fed well. 2. * * * 3. There also came on the inside of one of his hind legs a large swelling which extended from his privates to the inside of his leg. The swelling was very hard and looked very red. He shows no signs of the swelling now. 4. My foxhound moves around without much life and is losing flesh rapidly. He does not run at the eyes or nose What shall I do for him? Ans. 1. Injections of one half a teaspoonful of laudanum mixed with a tablespoonful of starch water would have checked the diarrhœa. 2. Oil should have been at once applied to the part affected and the member restored to its sheath. Allowing the dog to serve the bitch as often as you state was all wrong. 3. The swelling was produced by the straining of one of the nerve centres of the leg. The lifting of the leg like a horse with the string halt will probably right itself. 4. Feed on the best of strong meat broths, and give the hound two grains of quinine three times a day.

101 C. F. B., Rockland, Mass.—I have a Newfoundland dog two years old that has sore ears and the trouble resembles canker. The ears become filled with clotted blood, which seems to give him more pain than ordinary canker should do. I have tried several receipts for canker in the ear without success. If injured the place will fill with puss and blood showing that his system is in poor condition. He is kept in the house and petted as much as a child. I think the trouble is greatly the result of overfeeding and want of exercise. Ans. Your dog's trouble is a constitutional one. Reduce quantity of food and feed only once a day—in the afternoon. Corn meal mush mixed with well-cooked vegetables should become his diet. Give half a teaspoonful of sulphur once a day for five days, first having given a good dose of castor oil. Do not expose your dog to the wet during the sulphur treatment, but later give exercise at regular hours. Keep the ears clean with tepid water and write result at the end of two or three weeks

102 M. W., Ridgewood, N. J.—I have a pointer puppy that is ruptured; a round lump protrudes from the naval about as large as a walnut. The puppy is seven weeks old. Ans. Place the puppy on his back and apply to the protrusion a conical-shaped portion of cork, with a broad base, covered or not with leather, secure the cork with strips of pitch plaster. The treatment is simple and invariably successful.

103 G. H. T., Philadelphia.—Your young dog has, from your description, the distemper. Give him the best meat broths and two grains of quinine three times a day. Keep him kennelled in a warm and dry place, but allow plenty of fresh air. Almost every case of this disease is different, there is no specific cure; all that can be done by us who are unable to see the patient is to advise for cases like yours the tonic treatment given above.

104 G. H. T., Philadelphia.—My setter dog, twenty months old, will not eat anything but meat. He won't eat mush made of half cornmeal and half oatmeal, and he refuses Spratt's biscuit. What shall I feed him on? Shall I starve him into eating mush? Ans. Yes. We recommend starving him into eating the mush. It is good food. It might be mixed with vegetable matter, such as greens, potatoes, etc., very well boiled. Unless you do this you will have great trouble with him when shooting in sections of the country where it is impossible to procure meat. Besides, a purely meat diet is not good for him.

105 G. M., New York City.—I have a large Newfoundland dog which for some time past has had bad fits. He sleeps in the house, is in the house, in fact, nearly all the time, and is principally fed on raw beeves' hearts and scraps from the table. When out for a walk he frequently staggers. He is costive in the bowels. Ans. Your dog's trouble arises from overfeeding and lack of exercise. Avoid giving meat, feed but once a day, and then let the food consist of mush, etc., mixed with well-cooked vegetables. Give a large half teaspoonful of sulphur once a day for four or five days, and during this treatment see that the animal is not exposed to the wet. Regular exercise, a cool and dry kennel, and the above course should soon set your dog all right.

106 FORRESTER.—Will you inform me what I can do for a young setter afflicted with blood-shot, gummy eyes, the result of distemper a year ago? In other respects his health is excellent. Have been giving him quinine, ginger and extract of conium (hemlock). Ans. Keep the eyes clean by bathing them twice a day with warm water, after which use a small amount of a lotion containing one and a half grains of sulphate of zinc to one ounce of water. You may continue the quinine if appetite is not good, but leave off the ginger and conium.

107 G. H. B., Watertown, N.Y.—I would ask about canker in my dog's ears. I have been doctoring since last fall until about two weeks ago, when I stopped, thinking the dog cured. I have since noticed at times the same strong odor. The only symptom is the odor. What can I do for it? Ans. Take carbolate of zinc four grains, mix in one ounce of water. Hold the dog's head on one side and pour a little of the lotion in the ear, cover the ear over with the flap, and let the lotion be retained a few minutes. This will probably relieve the dog of the trouble.

108 A. T. M., Brooklyn, N. Y.—A friend of mine owns a fine imported pointer bitch, which he lent to Mr Furman, the owner of the large trout ponds at Maspeth, L. I., for the purpose of raising a litter of pups from her and an imported dog owned by Mr. Mills, of Smithtown, L. I. On Sunday, Jan. 16, she pupped seven bitches and two dogs. Everything went on very well until Sunday morning, Feb. 13, when Mr. Furman noticed that the bitch seemed to be sick and that she acted strangely. He gave her some sulphur, but it did not relieve her, and when he went into her kennel some two hours afterward what was his surprise to see that she had dropped another pup (which was black as coal), it being four weeks to the day since she had given birth to the other nine. The pup was dead when Mr. Furman found it, but he thinks it was killed by being trampled upon by the other pups. The next day, Feb. 14, two of the pups died; on Feb. 15 two more died; on the 16th one died; on the 17th Mr. Furman came to me for advice as to what ailed the pups. I told him to take the rest of the pups from the bitch, because she had blood poisoning, and as long as she suckled them they would all die. He did as I told him, and now there are two pups left, both of whom seem to be strong and healthy, yet they look thin, and it is impossible to get any flesh upon their bones. This may seem strange, and no doubt many readers of the FOREST AND STREAM will say it is not true; but if they will take the trouble to see Mr. Furman he will show them the little pup, which he had set up by Mr Sargood, taxidermist, and many of Mr. Furman's friends will verify this statement. Ans. This is a very unusual, but not an impossible case. The "blood-poisoning" theory is probably the correct one, and the careful nursing of the puppies alone is all that remains to be done.

PUBLISHERS' DEPARTMENT.

Holabird Shooting Suits. Upthegrove & McLellan, Valparaiso, Ind.

Thousands die annually from some form of kidney disease that might have been prevented by a timely use of Hop Bitters.

"Therese Raquin," another of Zola's powerful and realistic novels, has been issued by Messrs. T. B. Peterson & Co., of Philadelphia. Price 75 cents.

Rifle and Trap Shooting.

THE ENGLISH CHALLENGE.—Poughkeepsie, N. Y., March 15.—Much has been said about the challenge received from the National Rifle Association of Great Britain, and of the manner in which it has been treated. It may be remembered by some, albeit I presume most people have forgotten, that a team was sent, or I should say went over to Ireland in the year 1880 to shoot a match with the riflemen of that country, which by great effort and good discipline was won by the American Team with the highest score on record, although, most of the team would have gone forth willingly to promote so glorious an undertaking without the hope of fee or reward. Our National Rifle Association promised Col. Bodine and his team their expenses, but when the time arrived for their departure they found they must depend mainly on their own purses. It was known by the Association when this team would return, but on their arrival no delegation, not even a representative, was on hand to greet them, and now they have not so much as a ribbon to show that they ever shot the great match of 1880. One of our sporting papers allowed its columns to be used to slander and abuse certain members of the team because they did not see fit to shoot in the Hyde-Halford match. To sum the matter up, this is why the present Board of Directors find it inexpedient to accept the challenge. The difficulty of raising funds to defray the expense of sending a team would not be great, but they find it difficult to get our leading riflemen to agree to act themselves up as a target for neglect, envy and detraction. H. F. CLARK.

CONLIN'S SHOOTING GALLERY.—March 19.—The ninth week of the Pistol Tournament ended to-night. The "race" target proved very satisfactory, and is considered a valuable acquisition to the already large number of marks for pistol practice. The target consists of ten aces (diamonds, hearts, spades and clubs) regularly spaced so as to form an oval. The shooting was at seven pace. The competitor making the greatest number of hits in ten shots to be declared the winner of the championship. D. A. Davis made the remarkable score of nine hits. His target is on exhibition at the gallery, and is without doubt one of the best records ever made with a pistol. Dr. E. T. Marsh record seven hits, and J. B. Miller won the "Conlin" badge, having scored five hits. The tenth and last week of the tournament will end next Saturday. The competition will be for the championship of shooting at Creedmoor target (one inch bullseye) distance fifteen paces. It is the reduced 200 yard target generally used in galleries throughout the country.

NEW YORK RIFLE GALLERY.—The match at this gallery for March has attracted much interest. Some very fine holding has been developed, as the scores of some of the leading ones will show. The shooting is at ring targets, one target to count; no limit to entries; possible for full score, 125:

G J Seabury	116	G Joiner	114
P G Fenning	116	J W Todd	113
H Oehl	115	Col Riggs	112
W Hayes	114	F S Harrison	111
A H Anderson	114	Jas Roche	110

The team match to be shot at this gallery will commence March 23; entries close on the 26th; captains will meet on that evening to draw for places, at 8 o'clock P. M. Rifle clubs and military associations respectfully invited to participate Seven men to each team, $10 entrance, 10 shots to a man, on Creedmoor target; all moneys paid in to be given in prizes of 50, 30 and 20 per cent.

March 21.—In the match for March at this gallery a great interest has been taken by some of the best marksmen and very fine holding has been done, as the leading scores to date will show:

Wm Kilen	119	F S Harrison	114
Col Riggs	116	A H Anderson	114
G J Seabury	116	G Joiner	114
P G Fenning	116	J W Todd	113
H Oehl	115	J N Mergenthaler	113
W Hayes	114		

MASSACHUSETTS VS. VIRGINIA.—The Rod and Gun Rifle Club of Springfield, Mass., not relishing their defeat on the 26th February, at once challenged the Wheeling Club for another match. The same was accepted and the match shot on March 12, with the result below. The Wheeling club have now demanded satisfaction and the final match will be shot in a few days:

Rod and Gun Rifle Club Team.

L H Mayott	12	11	11	9	11	11	9	11	11	12—108

MEDFORD, Mass., March 16.—To-day being somewhat more pleasant than for several weeks prior, Bellevue Range was thronged and forty-seven entries made. W. Charles led the list, making his eighteenth 49 shot out of a possible 50. Subjoined are the best scores made:

W Charles	5 4 5 5 5 5 5 5 5 5—49	H Appleton	5 5 4 4 4 4 4 5 5—44
A B Archer	5 5 5 5 4 4 5 5 4—47	H Withington	5 4 4 5 4 5 4 4 5—44
A C Andrews	5 4 5 5 5 5 4 4—46	J Richardson	4 4 5 5 5 4 4 5—43
W Jacobs	5 4 5 5 4 5 5 5 4—46	R Abbott	5 4 4 4 5 5 4 5 4—43
F E Going	5 5 5 5 4 5 4 5 4—46	A J Grout	4 5 4 4 4 5 5 4 4—43
A B Archer	4 5 4 5 4 4 4 4 5—43		

MAMMOTH RIFLE GALLERY—Boston.—In the Forest and Stream match Mr. W. H. Harrison has been putting in some fine work the last week and has succeeded in increasing his score 4 points:

Harrison	38 38 39 39 39—193	Edson	36
Sherburne	37 38 38 39 38—189	Goodspeed	36
Ross	37	Hart	36
Fogg	37	Daily	35
Bartlett	36		

The following are the leading competitors, with their scores to date, in the Amateur Badge match:

Maynard	36 36 36 36 37—181	Aronson	160
Pratt	36 36 36 36 36—180	Norcross	139
Williams	35 35 35 35 35—175	Dawson	156
Kelley	168	Nourse	160
Shannon	168	Nichols	162
Weymouth	166	Wolff	133
Cobe	164	Arnold	154
Brown	161		

In the Expert's match, for six cash prizes, the shooting has commenced in good earnest, and there have been some fine scores made:

Merrill	37 38 38 38 38—189	Arnold	36 37 38 39—150
Williams	37 37 37 37 37—185	Bartlett	35 35 36 36 37—179

In the Pistol match, at a Massachusetts target, there have been some remarkably fine scores made and a lively interest has been taken:

Williams	75 78 78—231	Kelley	57 59 64—180
Wilder	66 65 70—205	Warren	52 54 59—165

MAGNOLIA GALLERY—Boston.—At this gallery a large number have been at work. In the All-Comers' match Mr. J. Merrill made two full scores, a 49 and two 48s. E. Harris followed dangerously close for 243. In the championship match Mr. A. C. Maynard, a Chicago shot, well known in this city, made the elegant score in ten strings of 490 and Mr. M. Drew made 485. In the Forest and Stream match Mr. E. C. Arthur stands at the head of all comers with 245, Mr. E. Harris is recorded second place for 244 and Farnham third for 241. In the pistol match (ring target) Mr. C. Dunn takes first position with the splendid showing of 316, J. H. Williams taking second place for 307. The detail follows:

All-Comers' Match.

J Merrill	50 48 48 49 50—245	J J Ross	45 48 47 47 45—233

J Ames	97 99 98—295	E Wilder	70 68 64—202

BOSTON, Mass., March 19.—The early attendance was not large to-day at Walnut Hill, although the mid-day trains brought out large numbers, which made the pavilion just full enough for comfortable shooting, keeping three targets open and the participants busy. The day was spring-like, the snow having all disappeared from the range, and the long-range men were out for the first time this season. They did good work at the long distance, considering the chilly atmosphere and the changing light and tricky wind from the east, which was not easily controlled. W. W. Gerrish made, at the 800, 900 and 1,000 yards, the fine score of 211. At the 200-yard range the wind came directly across the firing points and proved demoralizing in many cases. The Amateur and Badge match did not fill, consequently the riflemen devoted themselves to the Massachusetts targets. Mr. Lee took first place in the Record match (Creedmoor) for 48, and Gould, Warren and E. Bennett for 76, respectively, in the Record match, off-hand (Massachusetts target). Below are the best scores only:

Record Match (Massachusetts Target).

Gould	11	12	10	11	12	12—68	Gordon	12	12	11	10	10	7—72
Warren	12	11	10	10	11	10	12—76	Emmerson	9	10	8	11	11	11	11—71
Bennett	10	11	11	9	12	12	11—76	Burt	10	11	10	11	6	10	12—70
Adams	10	11	12	10	10	11	11—75	James	11	9	9	10	10	9	11—69
Appleton	12	11	10	10	12	10	7—72	Gough	9	12	10	12	8	8	10—69
Ridbetts	9	12	12	11	9	12	11—76	Fenton	9	8	7	8	11	12	7—65
Arthur	10	12	10	11	9	10	12—74	Quint	7	8	10	11	8	11	9—64

Fellows	5	4	4	4	5	4	4	5	6	5—45	Borden	5	4	4	4	5	4	5	4	4	5	—44
Williams	5	4	4	5	4	5	5	5	4	4—45	Bradley	4	4	3	5	5	4	4	5	5	4	—43
Bennett	5	5	4	4	5	5	4	5	4	4—45												

HOPKINTON, Mass., March 18.—The Hopkinton Rifle Club held a meet at their grounds, Claflin Grove, to-day. The attendance was large and the weather conditions fairly favorable. Only the best scores in a large number of entries are given, as follows:

Dorchester	4	5	4	5	4	5	4	5	5	5—45	E R Rose	4	4	4	3	3	5	4	4	4	4	—39
Claflin	5	4	4	4	4	5	5	4	5	4—44	Stearns	4	5	3	3	4	4	5	4	4	5	—37
Jewell	4	5	4	4	4	5	4	4	5	4—44	Frost	5	5	5	4	5	4	3	4	4	3	—36
Smith	3	4	5	4	4	4	4	4	4	4—40	C H Rose	4	4	4	2	3	3	4	4	4	3	—34
Phipps	4	4	4	4	3	4	4	4	4	3—39	Wood	0	3	4	4	3	4	5	4	3	4	—32

WORCESTER, Mass., March 19.—The Worcester Sportsmen's Club have arranged for a glass-ball tournament at their range, near Lake Quinsigamond, Thursday, April 7, Fast Day. The shooting is to begin at 11 o'clock. The first on the programme is a team match for purse of $100, teams to consist of three men each, 20 balls per man. The purse to be divided into four prizes. Second event is a purse of $50; individual sweepstakes, 10 balls per man. Third event, purse of $100, individual sweepstakes, 15 balls per man. Fourth event, individual sweepstakes, purse of $50, 10 balls per man. A prize of $10 is also offered to the person who, shooting in all the matches, makes the best average score. Stedman Clark is Secretary of the club. The Committee of Arrangements consists of Messrs. E. S Knowles, A. P. Pond, W. S. Perry, C. B. Holden and S. G. White.

SHREWSBURY, Mass.—The club here, who have an occasional shoot at the Pine Grove range, have had another practice. Their work is told by the following:

400 Yards, any Position, Cartoon; Possible 60.

C Jenkins	5 6 4 5 6 6 6 6 6 6—56		
	5 5 5 5 5 6 6 6 5 5—54		—112
Moses Carter	4 5 6 6 6 4 6 5 6 6—58		
	6 6 5 5 6 5 5 6 6 5—55		—108

400 Yards, Off-hand.

S Clark	4 3 3 5 6 4 4 4 4 4—41	J Norman	3 4 4 5 4 4 6 4 3 4—41

200 Yards, Off-hand.

C A Allen	4 4 4 4 5 5 4 4 5—42	J Norman	4 4 4 5 4 5 4 4 4 4—42
M Carter	5 4 4 4 4 4 4 5 4—42	S Clark	4 4 4 4 3 5 4 4 5 4—41

GARDNER, Mass., March 18.—The following are the late scores made at Hacmetack Range, in this town; distance, 200 yards, off-hand, with inch ring and creedmoor target combined:

	R. C.	R. C.	Totals.		R. C.	R. C.	Totals.
Ellsworth	89—43	94—47	183—92	Austin	84—46	78—43	162—89
Newton	85—45	85—46	170—91	Goodale	74—41	73—42	147—86
Matthews	83—46	77—45	165—91				

NEW YORK STATE ASSOCIATION.—Orders for prizes are being received in large numbers and the committee are confident of having the most valuable prizes ever offered at a State tournament. Mr. H. W. Abbott, of Boston, has painted a winter scenee, representing how the quail, during a great stress of cold weather, are compelled to seek the outhouses and sheds of the farmer for food. The canvas is in size ten by fourteen inches.

Messrs. Crouch & Fitzgerald, of New York, have donated a gun and traveling trunk combined. Messrs. Hartley & Graham have presented a W. & C. Scott & Son's gun, the grade not specified, but doubtless will be a Premier. The Hannis Distilling Company, of Philadelphia, have subscribed $200 cash. Want of space precludes the description of the rest of the prizes, but we will publish descriptions of them in succeeding issues of FOREST AND STREAM.

THE TRAP.

THE CHAMPIONSHIP CUP—London, *March* 16.—The contest for the World's Challenge Cup closed to-day at Hendon in a victory for Dr. Carver. The match grew out of an offer of a cup by the *Sportsman*, and entries closed at that office on the 7th inst. The entries included in all thirteen names, including two American representatives. In several cases competitors have chosen to shoot under assumed names, this privilege being granted in the conditions already published. The list stood:

Dr. Carver (America), Mr. Ira Paine (New York), Mr. Turner-Turner, Mr Scott, Mr. Gordon, Mr. Hadlow, Mr. Beavor, Mr. Radnor, Mr. Graham, Mr. George Brighton, Mr. W. Holledge, Mr. Cavendish, Mr. Carrington.

The conditions provided that "the contest commences at the Union Gun Club Grounds, Hendon, on March 14. The first prize will consist of the cup, the whole of the sweepstakes less £100, and a proportion of the gate money after deducting expenses. Any gentleman winning the cup who may object to receive money may have his share of the gate money in the shape of a gold or silver trophy or any *objet d'art* he may choose. The £100 deducted from the sweepstakes will be awarded as a second prize. The holder of the cup to defend his title to the trophy against all comers for the period of two years, a match to take place within two months from the date of any challenge if in England, or three months if abroad. In the event of the cup being taken abroad, the holder to find sureties for the value of the trophy or deposit the amount in money with the proprietors of *The Sportsman* before taking the cup from England. In the preliminary ties the competitors will shoot at fifty birds each, but the two gentlemen left in the final will shoot at one hundred pigeons each. Guns must not exceed eight pounds in weight; no concentrators will be allowed and the shot must not exceed one ounce and a quarter; size to be restricted to 5, 6, 7 or 8, inclusive; not more than four drachms of powder to be used. Each competitor will stand at thirty yards rise, and the use of both

barrels will be allowed. In the event of a gun or cartridge being challenged by any of the competitors, the challenger will have to deposit £2 in the hands of the referee, which shall be forfeited in the event of the objection not being sustained. The contest will commence on Monday, March 14, and as it will probably extend over several days shooting will begin each morning at twelve o'clock punctually. None but the best blue rocks obtainable will be used. The birds will be procured from the various venders of pigeons in the metropolis. It has been decided that the birds shall *not* be mixed. Each purveyor providing pigeons will be requested to attend with a certain number of rocks and a "trapper," and the pigeons will be used in succession—Mr. A's supply being trapped first, Mr. B's next and Mr. C's next. The order in which the supply shall be made will be decided by drawing lots. The birds may be marked if the vender chooses."

In the 1st stage Dr. Carver killed 28 in 50, and Ira Paine only 23, Graham scored 35, Radnor 42 and Turner-Turner 38.

In the second stage of the pigeon shooting match for the championship of the world, at Hendon on the 15th, Dr. Carver beat Turner, 38 birds to 33; Gordon beat Hodlow, 36 to 33; Scott beat Beavor, 35 to 34; Graham beat Radnor, 38 to 34, and Gordon beat Cavondish, 34 to 32. The third round of the contest was shot today with Graham against Carver and Gordon against Scott.

Dr. Carver beat Graham by a score of 40 to 36, and Scott beat Gordon 40 to 39. The deciding heat, at 100 birds each, was then shot in four stages. At the beginning Scott was rather the favorite in the betting. The scores were as follows:

Carver—21, 18, 21, 19. Total, 79.
Scott—15, 19, 24, 16. Total, 74.

Dr. Carver thus wins the title of champion, the cup and £650 stakes. Immediately after the match had been decided Mr. Scott challenged Dr. Carver to a match for the cup and £200 a side, the contest to be according to the conditions under which the cup was given and to be decided within two months. A gentleman present offered to bet £500 that Scott would win.

BALTIMORE, Maryland, March 13.—A very pleasant series of pigeon matches were shot here on the 8th inst. under the management of Mr. C. S. Wertsner. Mr. Edward L. Mills, of the Treasury Department, Washington, D. C., and Mr. J. L. Wintersmith, clerk to the Committee on Commerce, House of Representatives, came over from Washington and participated in the shooting. Mr. Mills carried off a majority of the prizes, scoring 68 out of 74 birds shot at during the day. Capt. Hussle and Mr. Ritter, of this city, shot remarkably well, and were Mr. Mills' closest competitors. The matches were all shot under the following conditions: 21 yards rise, 5 traps, one barrel:

First match, $2 entrance, miss and out:

Mills	1 1 1 1—4	Wertsner	0
Ritter	1 1 1 0—4	Wroten	0
Wintersmith	1 0		

Purse, $10, won by Mr. Mills.

Second match, $1, freeze out:

Mills	1 1 1 1—5	Capt. H.	1 1 1 1—5
Wintersmith	1 1 0	Ritter	1 1 0
Wroten	0	Lucas	1 1 1 0—4
Wertsner	0	Bixer	0

Purse, $8, divided by Mills and Capt. H.

Third match, $1, freeze out:

Mills	1 1 1 1—5	Ritter	1 0
Capt. H	1 1 1 1 0—4	Lucas	0
Wintersmith	0	Wintersmith, re-entry	0
Wertsner	1 1 0	Stevens, "	1 0
Stevens	0	Wintersmith, "	1 1 1 1—5

Purse, $10, divided by Mills and Wintersmith.

Fourth match, $1 freeze out:

Mills	1 1 1 1—5	Stevens	1 1 0
Wintersmith	1 1 1 0	Ritter	1
Linthicum	0	Linthicum, re-entry	0
Capt. H	0	Wintersmith, re-entry	0

Purse, $8, won by Mr. Mills.

Fifth match, $1, freeze out:

Mills	1 1 1 1 0—4	Linthicum	1 0
Wintersmith	1 1 1 0	Kenley, re-entry	0
Ritter	1 1 1 1—5	Kenley, re-entry	1 1 1 0—4
Capt. H	1 1 1 1—5	Stevens	1 1 1 0
Kenley	0	Linthicum, re-entry	0

Purse, $10, divided by Ritter and Capt. H.

Sixth match, $5 entrance, 5 birds; two moneys, 60 and 40 per cent:

Wintersmith	0 1 1 1—3	Capt. H.	1 1 1 0—3
Mills	1 1 1 1—5	Kenley	1 1 1 0—4
Ritter	1 1 1 1—5	Engle	1 1 1 0 1—4
Kell	1 0 0 0 1—2		

Mills and Ritter divided first prize.

Ties on four at three birds.

Kenley	0 1 1 1 1- 1 0	Engle	1 1 0 1 1 1 1 1

Second money won by Engle.

Seventh match, $5 entrance, 5 birds; money divided, 60 and 40 per cent.:

Mills	1 0 1 1 0—3	Engle	1 1 1 1 0—4
Ritter	0 1 1 1 0—3	Capt. H	1 0 1 0 1—3
Wintersmith	0 0 1 0 0—1		

Engle first money.

Ties on three, miss and out.

Mills	1 0—1	Ritter	1 1—2
Capt. H.	1 0—1		

Ritter second money.

Eighth match, $2 entrance, one money:

Mills	1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1—16		
Ritter	1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 0—15		
Linthicum	1 1 1 1 1 1 1 1 1 0		
Wintersmith	1 1 1 0		
Engle	1 1 0		
Kell	1 1 1 1 0		
Wroten	1 1 0		
Capt. H	1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 0—15		
Stevens	1 1 1 1 1 1 1 0		
Buckbee	1 1 1 1 1 0		

Mills won on sixteen straight.

Ninth match, $2 entrance, 3 birds:

Mills	1 0 0—2	Robinson	1 1 0—2
Wintersmith	0 1 1—2	Bancroft	1 1 1—3
Ritter	1 1 1—3	Linthicum	1 0 1—2
Kell	1 1 1—3	Aleck	1 1 1—3

Divided by Ritter and Kell.

Tenth match, same conditions:

Mills	1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 0—18		
Wintersmith	0 1 1		
Linthicum	1 1 1 0		
Ritter	1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1—19		

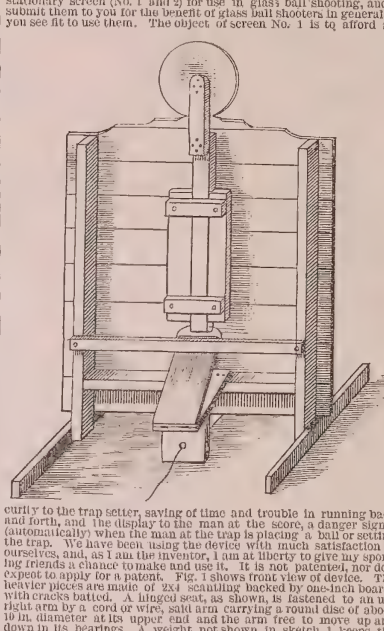
Won by Ritter on 19 straight. B.

CARVER VS. SCOTT.—London, March 19.—The shooting match between Dr. Carver and Mr. Scott for a purse of £600, which began on the 9th inst. at the Aquarium, Westminster, was concluded to-night. It has been from the start a most remarkably close contest. Each evening during the ten days of the contest each of the men fired at 1,000 balls, making a total of 10,000. The score at the close of each stage stood:

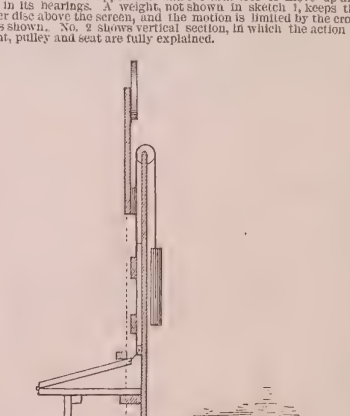
	Carver.	Scott.		Carver.	Scott.
First night	940	933	Sixth night	8,811	8,834
Second "	1,909	1,909	Seventh "	6,812	6,805
Third "	2,882	2,883	Eighth "	7,801	7,793
Fourth "	3,865	3,857	Ninth "	8,789	8,789
Fifth "	4,884	4,833	Tenth "	9,737	9,735

BROOKLYN GUN CLUB.—A chilly day met the shooters at Dexter Park on Friday last, but the monthly match was well contested, nevertheless, as indifferent birds, as the summary shows. First shoot for a gun presented by the club, the prize to go to the member winning it the greatest number of times during the monthly competitions, from five traps placed five yards apart, handicap rise, 80 yards boundary; winners to go back two yards in subsequent shoots, but never beyond 31 yards; club rules governing ties:

H. Lee	26 yards	1 1 1 1 1 1 1 1 1—1 1 1—18	
Dr. Funson	23	1 1 1 1 1 1 1 1 1—0 1 1—12	
Dr. Munn	23	1 1 1 1 1 0 1 1 1	—9
W. Wilson	29	0 1 1 1 1 1 1 0 1	—8
G. H. Creed	25	0 1 1 1 0 1 1 1 1	—8
A. Eddy	25	1 0 1 1 1 0 1 1 1	—8
C. W. Post	23	0 1 1 1 1 0 1 1 1	—8
J. Bryer	25	1 1 1 1 1 0 1 1 0	—8
T. B. Anderson	25	1 1 0 1 1 0 1 1 1	—8
Robert Robinson	23	1 0 1 1 1 0 1 1 1	—8
W. Westley	25	0 1 0 1 1 1 1 0 1	—7
W. Lawrence	23	1 1 1 1 0 0 1 1 0 1	—7
I. Leroy	25	1 1 1 1 0 0 0 1 0 1	—6
R. Barker	25	0 1 1 1 1 0 0 1 0 1	—6
W. Hill	23	1 0 1 1 1 0 1 0 0 0	—5
S. White	23	1 0 0 1 0 1 0 0 0 0	—3

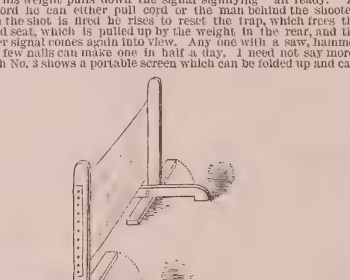


Referee, Mr. L. G. Reed.



A USEFUL TRAP SHOOTING APPLIANCE.

Editor Forest and Stream:



WHITE MILLS, Pa.

I herewith inclose rough pen sketches of a portable (No 8) and stationary screen (No. 1 and 2) for use in glass ball shooting, and I submit them to you for the benefit of glass ball shooters in general, if you see fit to use them. The object of screen No. 1 is to afford security to the trap setter, saving of time and trouble in running back and forth, and the display to the man at the score, a danger signal (audible) when the man at the trap is placing a ball or setting the trap. We have been using the device with much satisfaction to ourselves, and, as I am the inventor, I am at liberty to give my sporting friends a chance to make and use it. It is not patented, nor do I expect to apply for a patent. Fig. 1 shows front view of device. The heavier pieces are made of 2x4 scantling backed by one-inch boards with cracks batted. A hinged seat, as shown, is fastened to an upright arm by a cord or wire, said arm carrying a round disc of about 10 in. diameter at its upper end and the arm free to move up and down in its bearings. A weight, not shown in sketch 1, keeps the danger disc above the screen, and the motion is limited by the cross bar as shown. No. 2 shows vertical section, in which the action of weight, pulley and seat are fully explained.

The operation of the device is as follows: When no weight is placed upon the hinged seat the weight in the rear pulls up the seat until stopped by the cross bar, which, of course, brings the red danger disc into view (this is its normal position). When the man at the trap has placed his ball and set the trap he sits down upon the hinged seat; his weight pulls down the signal signifying "all ready." At the word he can either pull cord or the man behind the shooter. When the shot is fired he rises to reset the trap, which frees the hinged seat, which is pulled up by the weight in the rear, and the danger signal comes again into view. Any one with a saw, hammer and a few nails can make one in half a day. I need not say more. Sketch No. 3 shows a portable screen which can be folded up and carried in the hand. It will stand alone without any driving of pegs into frozen or stony ground and makes a good screen when no regular shooting ground is used. If the inclosed are of any use accept them as a friendly greeting to FOREST AND STREAM.

I should have mentioned in regard to this apparatus that the sliding standard and pulley should be made sufficiently free to allow for swelling by rain, etc., also that the trap should be placed just out of reach of the hand of the man at the screen, since he would find it easier to sit still and set the trap than to rise up, which would compel the signal to appear each time, and this is one of the good features of the device. F. G. FARNHAM.

The device here described is one which will at once recommend itself to trap shooters, and as our correspondent has so courteously placed his invention at the service of the readers of FOREST AND STREAM we shall expect to hear of its adoption by clubs.

LONG BRANCH GUN CLUB.—The annual competition for the Long Branch Subscription Cup will take place on the club grounds at Deal Beach, Central R. R. of N. J., Long Branch Division, on Tuesday, July 5, commencing at about 10 A. M., and will be open to all organized clubs under the following conditions: Long Branch Gun Club rules, 30 yards rise, $50 entrance, the total amount to be expended for the cup. One team of five members from each club, 15 birds per man. Each team shall be entitled to a judge, and the judges to choose a referee. Ties, if any, to be decided by three rounds to each and every team tying until finished. Should a conclusion not be reached on the above-named day by 6 P. M., then it shall be carried over to the following day. Entries close June 1, and all clubs intending to compete must so signify, and remit the entrance fee, $50, to N. W. T. Hatch, Treasurer, 14 Nassau street, New York, on or before that date. All clubs are cordially invited to participate, and it is hoped that a large number will enter, for the double purpose of establishing the supremacy and that the emblem thereof be the more valuable.

WORCESTER SPORTSMEN'S CLUB.—Programme of glass ball tournament to be held at their range, near Lake Quinsigamond, April 7, 1881. First event, 11 A. M., team match for purse of $100; teams to consist of three men each; entrance, $5; 20 balls per man; the purse to be divided into four prizes of 40, 30, 20 and 10 per cent. Second event; purse of $50, individual sweepstake; entrance, $1; 10 balls per man. Third event; purse of $100, individual sweepstake; entrance, $2; 15 balls per man. Fourth event; purse of $50; individual sweepstake; entrance, $1; 10 balls per man. A prize of $10 will be offered by the club to the per on who, shooting in all the programme matches, makes the best average score.

Conditions.—1. All purses to fill or pro rate. 2. Purses excepting that of the team match will be divided into three prizes of 50, 30 and 20 per cent. 3. Class shooting will be the order of the day. 4. Balls will be sprung from a rotating trap at 18 yards rise. 5. Ties will be shot off at 21 yards, miss and out, except in team match, which will be at 21 yards and 5 balls per man until decided. 6. Tatham's selected blue balls will be used. 7. Entries to team match must be made before 10:45 A. M. of the day of the shoot. 8. Entries to individual sweepstakes may be made any time previous to the commencement of shooting in such sweepstake. 9. Individual sweepstakes will be shot before and after the programme. 10. To save time and facilitate the shooting, three strokes of the bell will announce purses open for entry. Two strokes, purses closed. One stroke, shooting commences. The management desire that those intending to participate should notify the secretary on or before Wednesday, April 6. No postponement on account of weather.

N. Y. GUN CLUB, March 13.—Despite the rain to-day several of the members of the New York Gun Club were at their grounds at Bergen Point, and five of them faced the traps to contend for the club final cup, valued at $100, entry $1, 10 birds each, to be awarded to that competitor who shall win it twice consecutively. Ties shot off at one bird. All ties are handicapped at 27 yards or 26 yards shall shoot at 25 yards. All who are handicapped beyond 27 yards shall shoot at 27 yards. The distance at which a competitor stands in the first competition shall be his distance in this match until finally decided:

E. M. Hammond	25 yards	1 1 1 1 1 1 1 1 1 0	—9
W. M. Watson	28	1 1 0 1 1 1 1 1 0	—8
T. C. Sanders	29	1 1 0 1 1 1 1 0 1	—8
E. White	29	0 1 1 1 1 0 0	—5
A. Jackson	27	1 0 1 0 1 0 1	—4

Same Day—Sweepstakes, $2 each; 10 birds each; ties miss and out:

W. Wesley	26 yards	1 0 1 1 1 1 1 1 1 1	—9
E. M. Hammond	25	1 1 1 1 1 1 1 0 1	—9
W. M. Watson	28	1 1 0 1 1 1 1 1 0	—8
T. C. Sanders	29	1 1 0 1 1 1 1 0 1	—8
E. White	29	0 1 1 1 1 0 0	—5
A. Jackson	27	1 0 1 0 1 0 1	—4

Same Day—Sweepstakes, $2 each; 7 birds each; miss and go out:

Wesley	27 yds...1111111—7	Watson	28 yds...1101010—4
Sanders	29 ....1111111—7	Hammond	26 ....1110 —4

Same Day—Sweepstakes, $2 each; 7 birds each; ties miss and out:

Wesley	27 yds...1111111—7	Hammond	26 yds...0011110
Sanders	29 ....1110111—6	Watson	28 0010100

FOUNTAIN GUN CLUB, March 17.—To-day a match was on the books between Mr. Hazzard, the present holder of both the Fountain and Rod and Gun Club badges, and Mr. H. W. Walter, the conditions being 50 birds each, 1 barrel, 1 ground trap, 25 yards, each to handle and trap for the other, Fountain Gun Club rules. Such was the inclemency of the weather that most of the old sportsmen supposed the match would be postponed. Such was not the case. Half a dozen coach-loads of friends of the contestants left Harry Miller's, headquarters Fountain Gun Club, 449 and 451 Flatbush avenue, at 1:30 P. M., for Hiram Howe's Driving Park, in the worst of the pelting rain. The traps furnished by Mr. Miller were all from the same baskets and proved a strong, hardy lot. The wind and the rain had their effect on the shooting, although Mr. Hazzard killed 26 and missed 15, his opponent killing 15 and missing 26 and retiring on his 41st bird. Mr. Hazzard killed 4, missed 1, killed 5, killed 9 straight, missed 1, killed 3, missed 2, missed 3, killed 4, missed 1, killed 2 and missed 3 and stopped. Mr. Walter after killing his first missed 4, killed 4, missed 4 again killed 1, missed 1, killed 2, missed 3, killed 1, missed 1, killed 1, missed 2, and alternately killed and missed to his 33d bird, when he missed 8 straight and surrendered. The match was nominally for the birds.

BROOKLYN, N. Y., Wednesday, March 15.—The monthly contest for prizes by the members of the Coney Island Rod and Gun Club took place at the club grounds this afternoon, and proved to be an affair of more than usual interest. The club has not been long in existence, but although the youngest it is also one of the most thriving sporting organizations of Brooklyn and vicinity. The members and their friends congregated in goodly numbers at two o'clock. The day was perfect. The prizes to be shot for were a beautiful and expensive diamond badge, a case of stuffed birds, presented to the club by Mr. F. F. Briggs, and a heavy silver napkin ring. This was the first shoot for the badge. It must be won a majority of times at the monthly contests of the year to become the personal property of the winner. Fourteen gentlemen entered the lists yesterday. They gave their names as follows: Williams, Madison, George, Price, Dixon, McLoughlin, Captain Bill, Sicherung, Hazzard, Furey, Shevlin, Defrane and Slane. The new rules, which allow the gun to be held anywhere except at the shoulder, were in force. The boundary was eighty yards, and the traps used were a new thing in the line, and known as J. J. King's patent ground traps. Mr. Schwatka acted as referee and Mr. H. Goodwin kept the score. Harry Miller furnished the birds. The score stood:

Grace	1 1 1 0 0 0 1—4	Captain Bill	1 1 1 0 1 0 1—5
Williams	0 1 0 1 1 1—5	Sicherung	0 1 0 1 1 1 1—5
Madison	1 0 1 0 0 1 0—3	Hazzard	1 1 1 1 1 1 0—6
George	1 0 0 0 1 0 0—2	Furey	0 1 1 1 1 1 0—5
Price	1 0 0 0 1 0 1—3	Shevlin	0 1 0 1 1 1 1—5
Dixon	0 1 0 1 1 1 0—5	Defrane	0 1 1 1 1 0 0—4
McLoughlin	1 0 1 1 0 1 1—5	Slane	1 1 1 1 1 0 1—6

Messrs. Hazzard and Slane shot off their tie, three birds each, miss and go out. Mr. Hazzard won the badge, killing three birds straight.

The case of stuffed birds was won by Mr. Defrane, but the ties for the napkin ring were not shot off.

RIVERTON GUN CLUB.—The Riverton Rifle and Gun Club, of Philadelphia, announces that its spring pigeon-shooting meeting will take place on Friday and Saturday, March 25 and 26, at its grounds at Riverton, N. J., and that the competitions are open to all members in good standing of the following clubs: Narragansett, Maryland, New York, Philadelphia, Long Branch, Orange, Staten Island and the Westminster Kennel Club. The programme announced is as follows:

FRIDAY AT 11 A. M.

Opening mate, a handicap at $5 each, 7 birds, ties miss and go out; first prize, an old English three-handled Love cup of hammered silver and 40 per cent. of entrance fees; second prize, a large polished bronze inkstand and 30 per cent of entrance fees; third prize, a hammered silver cigar-lighter and 20 per cent. of entrance fees.

No. 2, at 2:30 P. M.—Match at single and double birds at $10 each: 6 single, handicap rise, and 3 pairs at 25 yards, from end traps; ties at 1 single and 1 pair; first prize, a piece of bronze, presented by E. Ward Grubb; second prize, a Grecian vase of silver, copper and bronze, and 25 per cent of entrance fees; third prize, a set piece of game birds and 10 per cent. of entrance fees.

SATURDAY AT 11 A. M.

Visitors' match (resident members of the Riverton Club barred): entrance, $10 each: 7 birds, handicap rise; ties miss and out; first prize, a bronze group, presented by the Directors of the Riverton Gun Club, and 40 per cent. of entrance fees; second prize, a Turkish cutlass paper knife, in silver and bronze, and 30 per cent. of entrance fees; third prize, a holsteric barometer and 20 per cent. of entrance fees.

No. 4, at 2:30 P. M.—Riverton Cup; entrance, $15 each; 20 birds, 30 yards rise; ties miss and out; first prize, the Riverton Cup and $50; second prize, a field gun; third prize, a silver hip-pocket flask and $25.

Visitors from New York can take the 7:30 A. M. train via the Pennsylvania Railroad, arriving at Riverton at 11:16 A. M., returning at 5:59 and arriving in New York at 6:50.

LONG BRANCH.—The Long Branch Gun Club proposes to make its coming summer season at Deal Beach an active one, and the Governing Committee announces that the shoot for the Long Branch Subscription Cup will take place on the club grounds at Deal Beach on Tuesday, July 5, beginning at 10 A. M. It is open to all organized clubs, under the following conditions:

Long Branch Gun Club rules, 50 yards rise, $50 entrance, the total amount to be expended for the cup; one team of five members from each club, 25 birds per man; each team will be entitled to two judges, and the judges to choose a referee; ties, if any, to be decided by three rounds to each and every team tying, until finished; should a conclusion not be reached by 6 P. M. it shall be carried over to the following day.

Entries, to close June 1, must be accompanied by the entrance fee, $50. Address N. W. T. Hatch, Treasurer, 14 Nassau street, New York City.

FALCON GUN CLUB—Dexter Park, Long Island, March 17.—State rules, plunge trap, 7 birds each, 21 yards:

Van Staden.....	1	0	1	1	1	1	1	1	0	1—6
Gold club badge and B. L. gun won by Offerman, killing all 7, and, there being no possibility of any other member to tie and being short of birds, the other members withdrew to save the balance of birds for a sweepstake shoot. Wind strong and birds good.										

Yachting and Canoeing.

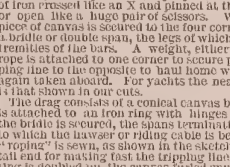
WINTER CRUISING IN SAN FRANCISCO BAY.

THE summer yachting season over we began to talk duck shooting. We talked two or three weeks about it. All we wanted now was favorable weather, a little rain, a little storm to bring in the ducks, and it came on a Friday, just the thing, and an expedition was assured. We came down town on Saturday, expecting to find our office besieged with applicants for passage on the Emerald (yawl), but it wasn't. During the course of the day the fact was developed that the change in the weather was too much for the constitution of Butler No. 1. No. 2 thought he was away from his business; Nos. 3, 4, etc., had made previous engagements, and so on. There were, however, several whose engagements would not occupy them longer than Saturday night, and it was therefore proposed that each go on a sort of reconnoitering expedition on Sunday. We would go and find the ducks and have some roasted for our dinner, and come back and tell those who were sick and didn't.

Orders were accordingly given that we would positively sail at 7 A. M. Saturday evening the sun went down with a gentle westerly wind, but the morning dawned overcast, and the wind from the stormy quarter, southeast. It appeared altogether light and a most propitious day for hunters. At five minutes before seven we reported to the skipper, the solitary individual on board up to date. The yacht was provisioned for about a two-hours' cruise, making an allowance for the ducks we would shoot, but it suggested itself that some tenderloin beerstreaks might not go amiss in case the ammunition should get wet, or in event of some other improbable possibility. While we were receiving instructions from the skipper of a neighboring trading vessel as to the location of the base of such supplies, Mr. Bumpkin, another of our party, emerged from a coffee saloon close by. Now, Bumpkin, Sr., and Bumpkin, Jr., were to have brought the shot-guns, and Messrs. Muffin and Fix a rifle, and with a battery like that we were not afraid of any ducks. But here was the first wing reported in his prayer-meeting clothes—and no gun. Furthermore, he had not seen Bumpkin, Jr. Shortly Fix reported; he had no gun. Then Muffin turned up; he had no gun.

This was a pretty party to go duck shooting. We held a consultation and decided that we were not in such a hurry as we had been and would therefore give time to Muffin and Fix to go up and get their rifle. Our intention had been to go down the bay southward, but our destination was changed to Sheep Island, lying due westerly north, where there were known to us to be some fat oysters of Eastern pirentage and, as these were not gifted with wings by a kind Providence, we deemed them more certain of capture. While M. and F. were gone we devoted the time to opening a few more supplies. We intercepted a flying bakery and a dairy in succession.

The milk and rifle being now aboard, the lines which held the yacht fast were cast off and in a few minutes we were out of the dock and underway. Our friends, Muffin and Fix, on their way up town unfortunately ran across an old skipper acquaintance to whom they divulged the destination of our party. In ominous words he cautioned them against the dangers of encountering a genuine Southeaster in these climes. His remarks weighed heavily on their minds, especially on the one who had to take Erie and Pittsburgh rifle and the beautiful, bright phosphorescence of the angry waves had no longer had charms for him. It was, therefore, proposed that we should return to our original design and steer for Mulford's Landing, at the mouth of San Leandro, same, emptying into the bay several miles beyond San Leandro. This would be on a weather shore and in case the wind did increase we could run the yacht into shelter in the creek and return by rail, or we could run home before the sea. We stood across to the Alameda shore and tacked along it, with the tide in our favor and a fresh breeze. It was dark and cloudy, but a glowing fire in the cabin below and a cup of hot coffee promptly thawed the blue blood from our plebeian veins and kept us comfortable.



So we passed the month of San Leandro creek. The air and water were literally alive with ducks, and they seemed to be rather entertained than otherwise by our presence and flew around the muzzle of Muffin's rifle with provoking impunity. The wind had been growing lighter as we neared it, and it was necessary to set our lights sails in order that we might reach our objective point before the tide should turn against us. Between 10 and 11 A. M. the clouds on the Western shore began lowering in showers of rain, closing out from view Alcatraz, Telegraph Hill, Hunter's Point and all that shore in rapid succession. Around us the atmosphere below was clear enough above, but no rain. We kept on a little south of a point opposite our destination and were now heading directly toward the shore for the Wharf, the general trend here being a little south of East. As our nearer approach magnified the objects, which heretofore had been indistinct hills forming the background and the dark gray sky beyond. Looking astern we seemed out on the boundless sea, no land in sight, and the horizon seemingly only a half mile distant. And as we logged we fondly dwelt on the sweet satisfaction that we were for once cut off from that wicked world which is constantly conspiring to induce you to part with your hard-earned coin in exchange for "Exchequer" at fourteen dollars per share, or threatening to burn down your house unless you discharge your cheap labor and come down to leader bread for thirty dollars a month and board.

"Half one!" "seven feet!" "five feet!" "hard bottom!" in rapid succession from the industrious Fix who was jamming the boat hook into the water alongside suddenly terminated our reflections for the time being. We were yet about half a mile from the wharf and with not much more water than necessary to float us, as we drew four feet. The ebb and flow of the tide through the creek or slough has cut a channel about thirty feet wide, but only for about a hundred feet out into the bay; from that point for a mile out there is a uniform depth of about six feet at high water, and none whatever at low. For another mile there is about two or three feet more water. These are the Alameda flats. Sail was now quickly shortened in order that if we ran aground we would not do so with much force. A few minutes carried us into the channel, which is designated by piles, placed at intervals on the western edge and buoys along the eastern. When within fifty yards of the wharf, and having considerable headway, the sails were lowered; but the tide was running out like a mill-race and at once swept us off to the edge of the channel and hard aground. The water was now falling fast and no time was lost in taking a hawser to a pile, the end aboard passed around the windlass and all hands piped to "heave around." At first the yacht moved a little, but the line gradually tightened until at last it parted and we were left without any hope of returning to San Francisco in our craft that day. It was determined, therefore, to leave her in charge of the steward and proceed homeward by rail. However, we had several hours to spare, so we composed ourselves and proceeded to breakfast, which had been some time awaiting our leisure. The water under the yacht rapidly that before we had finished the vessel had careened over on her side so much that the dishes had to be propped up at one end to prevent their contents running out. The outer edge of the rain-cloud also just reached us in a fine drizzle, and the momentary increase of the size of the drops indicated the approach of the main body. It was now discovered that unless haste was made there would not be water enough around the yacht to float the yawl, in which case we would be left aground where we were on the next stage of the ebb tide, midnight. Already two were as many as she could carry, therefore no delay was made in setting the first ashore. By the time the third trip was made there was not sufficient water to float the yawl with one person back to the yacht. So the skiff of a schooner was borrowed; but she also by that time could not reach the yacht, aboard of which the writer, being the lightest, had been left to the last. Finally, the Emerald's ship-keeper rolled up his pants and carried the last of the company ashore on his back. Thus, rather ignominiously, did our cruise come to an end, but it was nevertheless enjoyed while it lasted, as well as for the experience gained. J. C. C.

THE McMANUS SEA ANCHOR.

THE value of a sea anchor or drag is well known to sailors, and one of them should be found on every cruising yacht for use off soundings. History furnishes a number of illustrations where vessels in the last extremity, often after loss of spars, have ridden out a gale with comparative ease when riding to a floating anchor of some kind. This may be improvised in a number of ways, out of any material at hand, such as lashing together a number of spare spars, gratings, or even buckets. In our own experience we found even the light spars of a mackerel seiner of great service when caught by an off-shore gale and unable to make anything to windward. Driven slowly down the coast until the capes of a large bay were opened, where the wind had a sweep of thirty miles and had tumbled up a big sea, we made things as snug as possible by lashing down a tarpaulin over the boats loose to the life lines outside, and then getting out our improvised sea anchor. This was made by lashing fore and mainmast and a couple of yards together, then stretching a rope span from end to end, to the centre of which a line was bent on, a good length paid out and the end made fast to the bow-ring and thrown overboard. A bucket was also tailed on to the spars and served to hold the boat from drifting seaward, while the spars broke the seas and the boat rode it out comparatively dry and easy. In Uncle Sam's navy all vessels are provided with a spritsail rig for similar purposes. It consists of a couple of bars of iron crossed like an X and pinned at the centre. They will fold up or open like a huge pair of scissors. When expanded a square-cut piece of canvas is secured to the four corners and a hawser bent on to a bridle or double span, the legs of which are fastened to the four extremities of the bars. A weight, either on the edge of the canvas or in rope is attached to one corner to secure proper immersion and a tripping line to the opposite to haul home with when the anchor is to be again taken aboard. For yachts the neatest arrangement, however, I shall show in our cuts.

The drag consists of a conical canvas bag with a circular mouth. It is attached to an iron ring with hinges in the centre. To this ring the bridle is secured, the spans terminating in a large eye or thimble to which the hawser or riding cable is bent. To strengthen the ring a "toping" is sewn, as shown in the sketch, and an eye seized on at the tail end for making fast the tripping line. When not in use the iron ring is doubled up, the canvas furled snugly by passing the buoy line around the whole. In this shape it occupies but little space and can be stowed away in a moment's notice. If you are anxious to lie head to wind, or wish to avoid drifting, the ring is opened, cable and trip bent on and hove over the bows.

THE DRAG IN USE.

READY FOR STOWING.

The bag fills as soon as a strain is brought on the cable and is prevented from sinking under foot by the cork buoy with just line enough to let the drag settle into solid water. To haul in, check the cable, jerk on the trip and haul in fast first, when the rig will come home without trouble. These drags have been introduced among Boston yachtsmen and find great favor. They are made by John H. McManus & Son, the well-known sailmakers of Commercial Wharf, Boston, and will, we believe, be forwarded to parties fitting out for a cruise when ordered. They are furnishing them to all the yachts for which they are making sails, and that includes quite a big fleet. Mr. McManus thinks that there is something in mainsails loose on the foot, as a test for some boats, and the cutting of such sails so as to sit well, is a specialty to which he has devoted much attention, he is likely to give thorough satisfaction to cutterman and others about to try the experiment. Things are brisk in his loft and all the Boston cracks will receive their main with the McManus stamp at the foot. Being a practical yacht sailor, and therefore not governed by blind adherence to the heresay lore and trade customs of the loft, his ideas are found abreast of the times and his work gives gratifying evidence that the problem of cutting well-setting sails of good "draft" has been solved in a manner perfectly satisfactory to the Eastern yachtsmen. Among the long list of ships canvased by him we rec rd the cutters Enterprise, Violet, Scorpion, Active and the yawl Edith, and the new 30-ft cutters soon to be launched from Lawley & Sons', at City Point, are to receive their sailing duds from the same source. Then there is a long string of sloops, including the famous little Gale, now owned by Mr. C. B. Hopkins, of Staten Island, and also the two new sloops, 32 and 45 ft. long, of Lawley's build, the schooner Breeze, sloops Magic, Ingeria, Heart, Echo, and the new Nora, Maud, Jenet and Thisby, all of which are to have new McManus sails, while the fleet he has canvased include the great majority of the fast and well-known yachts in the East, such as the schooners Yaniba, Idler, Adrienne and Active, the sloops, Viking, Sunbeam, Nimbus, Lottie, Thistle, Gwendolin, Madcap and the cats Fancy, Psyche, Fanny and a host of others too numerous to mention.

THE AMERICA CUP MATCH.

SUPPLEMENTARY to some editorial remarks in our last issue concerning the contemplated challenge for the America Cup by a new boat now building by Cuthbert, of Belleville, Ont., we quote the following from the *Belleville Intelligencer*, which is perhaps the best posted on yachting affairs across the border:

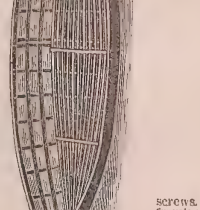
"Captain Alexander Cuthbert, who designed and built the Countess of Dufferin at Cobourg, is still of opinion that his yacht could have been had he been given opportunity to properly fit her for the match; but at all events he is determined to have one more trial for the coveted trophy. With this object he is building in this city, where he now makes his home, a vessel in whose model is embodied all his practical experience, and on behalf of which he will challenge in the name of the Bay of Quinte Yacht Club, of which he is a member. It must be remembered that he turned out the Annie Cuthbert, with which he carried off a Queen's cup won in England by an American yacht, and which was consigned to the custody of the Detroit Yacht Club as typical of the cruising craft of the lakes. In this match the Annie Cuthbert defeated the Cora, which was built by McGlehan, of Pamrapo, New Jersey, one of the most famous of American builders, to defend the title. The Norah, which Cuthbert built at Trenton for the Bay of Quinte Club, of which he is a member. It must be remembered that he turned out the Annie Cuthbert, with which he carried off a Queen's cup won in England by an American yacht, and which was consigned to the custody of the Detroit Yacht Club as typical of the cruising craft of the lakes. In this match the Annie Cuthbert defeated the Cora, which was built by McGlehan, of Pamrapo, New Jersey, one of the most famous of American builders, to defend the title. The Norah, which Cuthbert built at Trenton for the Bay of Quinte Club, of which he is a member, is, of this city, is an improvement on the Cuthbert, and undoubtedly her superior in speed.

"The keel of the Atlanta—which is the name selected for the Canadian representative in the next contest for the 'America cup'—was laid a few days ago, and some of her frames were set up yesterday. Her principal dimensions will be as follows: Length of keel, 63 ft.; length on water line, 64 ft.; length over all, 76 ft.; extreme breadth of beam, 19 ft.; depth of hold, 6 ft. 10 in.; draft of water aft, 11 ft. 6 in.; draft forward, 3 ft. 6 in.; centreboard box, 15 ft. long; draft with board down, 16 ft. 6 in. Spars—mainmast, 70 ft. feet to head; topmast, 34 ft.; main boom, 70 ft.; gaff, 36 ft.; bowsprit outboard, 25 ft. Tonnage, 84 tons. She will be cutter-rigged, and the principal dimensions of her lower canvas will be as follows: Stay foresail, 22 ft. on foot; jib, 28 ft. on foot; Jigot or mainsail, 42 ft. Balloon jib, gaff topsail and other light canvas will of course be provided. The frame will be of white oak and more than usually heavy, and the same timber will be used almost entirely, if not wholly, in the construction of the hull. The model is the finest that we have seen, and the Atlanta cannot fail to develop a very high rate of speed. It is not, of course, certain that the New York Yacht Club will choose a sloop to represent them in the contest, but we have information from a gentleman in New York, who is perhaps the best authority on yachting in America, that such would probably be the case, and also that they would likely waive the six months' notice.

"In case the holders name a sloop, the force from which the choice would in all probability be made are the Gracie, the Mischief and the Arrow, which are the largest yachts of their rig in New York waters.

"The principal dimensions of these craft are as follows: Gracie—79 ft. 10 in. over all; 70 ft. 9 in. water line; 21 ft. 6 in. beam; 6 ft. 8 in. depth of hold; greatest draft, 6 ft. 6 in. without board; hoist of mainsail about 65 ft.; tonnage, 121 tons. Mischief—67 ft. 5 in. over all; 61 ft. water line; 19 ft. 10 in. beam; 7 ft. 9 in. depth of hold; 5 ft. 9 in. draft without board; hoist of mainsail, 48 ft.; tonnage, 80 tons. Arrow—65 ft. 7 in. over all; 61 ft. 6 in. water line; beam, 20 ft. 2 in.; depth of hold, 6 ft. 9½ in.; draft of water aft, 5 ft. 6 in.; hoist of mainsail, 50 ft.; tonnage, 59 tons.

"It may here be explained that the tonnage of each is computed under the Bay of Quinte Yacht Club's rule. That of the New York Yacht Club is materially different, but the advantage will rest with the Atlanta, which will, under it, be relatively smaller as compared with either of the vessels named.



"The three craft particularized above are beyond doubt the best racers that exist among American sloops, the two latter having particularly distinguished themselves. It will be observed that they differ greatly from a sloop. Cuthbert's sailed, their beam being much greater in proportion to their length than in the case of the latter, and all are of greater tonnage than the Atlanta, although shorter, but the difference between her and the Mischief and Arrow is very slight. Let us hope that the best among them may be chosen to represent the famous club to which they belong, and that in yachting, as in sculling, Canada may bear away the palm of victory. The challenge will probably be formulated at the next meeting of the R. Q. Y. C., which will be held a few days hence."

A TURN TO WINDWARD WITH A SHARPIE.

Editor Forest and Stream:

We had "come to" under the lee of Cohansey Light for the night, when a sharpie rounded up close to us for the same purpose. We went on board of her, spending a pleasant evening with the skipper and his man discussing the merits of different shaped boats, etc., etc. Our yacht was 36 ft. over all, 13 ft. wide and 4 ft. draft, sharp as a wedge, with dead rise enough to let her down easy on the water. Her best point of sailing was at the wind with a tumble of a sea. The sharpie was 45 ft. long, 9 ft. beam, 4 ft. 6 in. draft, and half loaded. "As we are both bound down the bay I would like to have a brush with you in the morning, especially should the wind haul to the southward," said I. "All right" the skipper replied, as he lectured a conical, knowing looking centreboard. The day broke clear with a fresh breeze southeast, almost dead on end down the bay. The sharpie was already underway, with her foresail hauled over slightly to windward, evidently waiting for us. In a few minutes we were with him and the race fairly began. The first stretch we rounded the gentleman, and continued slowly but surely to open the gap. "Just what I expected," said I; "our long-legged friend may be good enough before the wind, but when he comes to stick his nose at he won't do." The wind freshened as the sun rose, and the water became considerably rumpled. Missing the sharpie I found he had gone off shore on his port tack, and was well off in the bay before he hove about. "Now, his goose is cooked. To be sure he has the channel tide in his favor, but he will never be able to climb the sea that's getting up out there," said I to myself, reflectively. I watched him closely, however, as we approached each other on different tacks, and a few minutes served to show me that he must after all pass to windward of us. I at once clapped a tackle on the luff tackle, and hove the mainsail down the mast as taut as a fiddle string, gave the peak halliards a pull, boarded our yawl, dropped the centreboard half an inch, and put away three drops of good old Jersey apple. The long-legged chap was now in to windward of us on the same tack, and found he could ease his sheets a little and run down across our forefoot whenever he wanted to, and with the square case trim that again and put us under his lee quarter. I saw with dismay we had no further business with him, and as the sea was increasing with the wind, and a reef if not two of them were already necessary, I proposed to run off around Egg Island and drop into the mouth of the river and fish. "Why not go down to the breakwater, Cap.? Better fishing there; besides we could show that New Londoner how fast we could beat his long, fat bateaux concern through a heaving head sea!" "Oh, blast that fellow! Our yacht is out of sorts this morning and so am I. I must shift her ballast as soon as we come to. I knew before we left Charlie had her trimmed too much by the stern." "Too thin, Cap! However, if you treat the party and promise us a good mess of trout for supper we will keep mum on the sharpie." "The ballast was not shifted, and I have a better opinion of sharpies than formerly. I believe any type of boat properly rigged, ballasted and handled will perform well. R. G. W.

CANVAS BOATS.—The Stranahan Canvas Folding Boat, manufactured by F. M. Hunt & Co., of Chagrin Falls, Ohio, will be found to meet the wants of sportsmen and tourists, and is very popular owing to its strength, lightness, strength and portability. The builders make use of a special waterproofing, intended not only to render the duck tight, but also to preserve its fibre in all climates. The canvas is of the best quality of 8 and 10 oz. duck. The ten foot boats have nine ribs, and the twelve and fifteen, six, the fifteen-foot boats have nineteen, bringing the ribs close enough together to prevent bagging of the sides, giving a fair boat for speed and a hand-some one to look at. Two side or bilge slats half way between rail and bottom serve to strengthen the whole structure and retain the ribs in their proper positions. Bow and stern pieces, gunwales, ribs and bilge slats are made of selected second-growth red elm, one of the lightest, toughest and most durable of woods. The bottom slats and stools are of bass-wood, tipped with copper to prevent splitting. The gunwales are 1¼ in. wide and ⅛ in. thick, the ribs and bilge slats being ¾ by ⅛ in., and bottom slats 1 by ⅛ in. The boat is folded by means of a joint in the centre, and is stowed compactly by turning one half over the other, as shown in the cut. For this purpose the frame is cut in the centre of the two pairs nearest together, as shown in the cut, the pieces cut alternating on each rib and fastening at each gunwale and at two points on the bottom with wrought-iron latches, fastened with 3-thumb-screws, making the joint as strong as any part of the frame. The canvas is secured by leather straps buttoned to the inside of the gunwales over round-headed screws. Before putting together the framing is all primed and painted. Oars and paddles are varnished and tipped with copper. For shipping the canvas is stripped and rolled up, the frames doubled up, and canvas secured inside the package, so that nothing can be misplaced, left behind or lost *in transitu*. The only seams in the skin are those at the ends, as the canvas is woven in one piece. The boats are said to stand a fair amount of sea, rising dry to everything on account of their lightness. They have two seats or stools, double set of rowlocks, and are handy for shooting or fishing, as they have a long floor. Under sail they do well with the wind abeam or quarter, one minute is the time required to unfold ready for use or to stow again, no tools of any sort being required. Three sizes are made and shipped to any part of the country. The smallest is 10 ft. long, is in. wide on bottom and 32 at top, with a depth of 11 in. at the centre and 15 in. at the ends, weighing 35 lbs. Carrying capacity, 400 lbs.; oars, 6 ft. long. The 12 ft. boat is intended for 600 lbs. capacity, and is 26 in. on bottom and 38 on top. Depth at centre, 13 in., and at ends 17 in., the whole with three stools and a pair of 6½ ft. oars, weighing 50 lbs. The largest size will carry 800 lbs. It is 15 ft. long, 28 in. wide on bottom and 46 in. on top, with a depth of 14 in. in centre and 18 at ends. Furnished with two pairs of 8½ ft. oars and four stools, the outfit weighs 65 lbs. All the carrying boats are well within the limits of the actual capacity, which is much greater when loaded down. A well-known sportsman writes concerning them:

"To those who desire a light boat for camp purposes we recommend the above. We had two of the 12 ft. size in use at our fishing camp last summer, one of which we sent to Florida this winter, and found them all the builder claims for them. They are literally as light as a feather, and ride the water like a duck, and are very staunch."

YACHTING NEWS.

SHADOW CANOE.—One of the best known Shadow canoes is offered for sale in another column by a gentleman giving up the sport.

GWENDOLEN.—This sloop, built by Woods Bros., East Boston, and owned last season in New York, has been sold to Boston parties, and will sail for her new hailing port soon.

NORAH.—Mr. J. R. Bell has had the name of his sloop, Bloodhound, changed to Norah. She is to be thoroughly fitted at Mill Point, near Belleville, Ont. It will be remembered that she was built last year, and turned out to be a smart flyer.

DEMAND FOR SMALL CRUISERS.—Mr. Stephens, of Rahway, expects to begin work soon on some two-tonners. Requests for estimates are coming in very fast. Small cruisers, hitherto unknown in New York waters, promise to make a class for themselves soon.

ATLANTIC YACHT CLUB.—Officers for the year: Commodore, L. A. Fish; Vice Commodore, W. R. Vermilye; Rear Commodore, T. A. Howell; Recording Secretary, W. W. Beebe; Treasurer, Richard G. Field; Measurer, George B. Moffat; Corresponding Secretary, J. C. Marcellus. The annual regatta is fixed for Saturday, June 11.

TIRED OF MACHINES.—A correspondent writes: "I live at Seabright, N. J., during the summer, and a year's "upland" sailing in the South Shrewsbury has more than satisfied me with a "jib and mainsail" and sand bags. I have come to the conclusion that more water and less sailing is more desirable than the reverse."

THE MARKET.—Generally an advertisement in our columns for a yacht brings a flood of answers. For a recent inquiry for a keel yacht, about 35 ft. long, only a few stray letters have reached us. This we take as proof that the market is exceedingly bare of such craft and that the real end for safe cruising craft of moderate tonnage is greater than the supply.

FRENCH YACHTSMEN.—We have had the pleasure of a call from M. Martial Caillebotte and yachting friends, of Paris, on a visit to this country in search of information about American yachts. They think that for some of the French rivers and shoal harbors, models more nearly like our centreboard boats would give more satisfaction for home cruising than the excessively deep English craft.

E RLY BIRDS.—Com. C. E. Chase had his canoe bubble overboard last week, and opened the season with a day's paddling to swell the scams of his double-ender, and Capt. Nolan, of the sloop Phœbe of Boston, has all to get his in preparation for a spring cruise. New York yachts are all ashore yet, and little activity has been shown so far. The season here promises to be unusually dull; few boats building. The racing season is likely to be very tame, unless relieved by the advent of the Canadian sloop, but much quiet cruising is in prospect, and that after all makes sailors and develops healthy craft.

MANNING'S CIRCULAR.—A late edition of Manning's yacht and shipping circular gives full particulars of 36 schooners, 37 cabin sloops of varying tonnages, 21 steam yachts, 9 launches, a lot of open boats, catamarans, etc., which are on the berth for sale. They report twenty yachts sold since the last edition of their circular, and a very fair demand for the season. Manning's agency has been established so many years, and is so favorably known, that it requires no endorsement from us. They have a virtual monopoly of the business, and sell nine out of every ten yachts disposed of through public offer.

YACHT MEASUREMENT.—Capt. R. G. Wilkins, an excellent authority on Delaware yachting, has written a very sensible letter to *A field and A float* on the necessity of abolishing length measurement. It we are to make any improvement in model and any headway in seamanship. That the single spar should be something more than a mere matter of athletics and a sort of tight-rope performance is beginning to be recognized on all sides. We quote from his letter, hoping that the very praiseworthy suggestion from the Trenton yachtsmen may soon be put into actual practice, and adding that the view of an "old sailing master" the Captain mentions coincides exactly with our own and hits the nail on the head:

"Our yachts are classified according to length, and, as no amount of sail is specified, the builder increases the beam so as to increase sail and speed. This leads to results, causing more friction, bringing a greater strain on the hull, spars and rigging, as well as upon the men. Why not tax sail area, or allow a certain amount proportionate to length? Or, as our yachting friends at Trenton suggest, allow one man for each foot of boat, discard sand bags and other shifting ballast, and so bring the yachts to sailing on their own merits.

"At the last regatta of the Cooper's Point Yacht Club, an old sailing master remarked to me: 'These boats are not built to win; they are built for the men to win.' Surely some equitable plan can be devised. Easy, graceful lines, and more style would soon follow; a boat would perform better when her reef cringles are hauled down and facing a head sea. A cloud of kites flying off the wind is a terror, and two thirds or the time wins.

"I hope other yachts will follow in the wake of the Pennsylvania Club. It would give great satisfaction all round. The builder would be the gainer, because increased resistance with its many advantages would in a very great measure compensate for loss of buoyancy and stiffness, and the owner would have a better behaved and less expensive boat, if not quite so fast.

"Finess some better form of classification is adopted, yachts of extreme beam, like the Minerva, must prevail. She is 30 ft. over all, 14 ft. beam, 4 ft. 2 in. deep, and is the "boss" of the Quaker City Yacht Club, if not of the world, for her length. The Minerva will visit New York this summer, when other types of yachts will have a chance of testing her speed and sea worthiness."

MINNEAPOLIS CANOE CLUB.—*Editor Forest and Stream:* We have organized a canoe club here with E. H. Moulton as Commodore; F. V. Raven, Vice Commodore; C. F. Wheeler, Treasurer, and A. B. Taylor, Secretary. Our headquarters will be at Lake Minnetonka, twelve miles west of the city on the St. P., M. & M. Ry. We expect to put up a house this spring with accommodations for from 40 to 60 canoes, with a hall above and wide veranda in front facing the lake. Several of the members have already ordered canoes from Kane & Co., Chicago, including their several models, "Shadow," "Cruising" and "St. Paul." We have a fine chance to test the merits of the various makes and models fully, and intend to do so.—H.

NOT SO BAD.—The Boston *Herald* says the dimensions we gave of Bibber's new catboat are wrong. This may be. We took our information from a source very near the *Herald's* office. However, the particular figures are immaterial. Yachts have been built almost circular in form, and as long as we race on length our reasoning will still apply. Had Bibber built on the figures we gave it would certainly not have been discreditable to him, but would, on the contrary, have shown a complete comprehension of the weaknesses of measuring by length. The figures we gave are not at all absurd on which a measurement rule, but quite possible, and boats of such dimensions will probably be built. But if we cannot believe the cold type of even our Boston contemporaries, the editorial scissors may as well be flung into the scrap-heap at once, and if that is to be done, what will there be left for many other contemporaries to print in the way of "Eastern Notes," stolen, body and soul, from our esteemed contemporary, the Boston *Herald*, without the least credit being given? For the present the *Herald's* information delays the agony, but does not remove the cause thereof.

Mothers with sickly, fretful, nursing children, will cure the child and benefit themselves by taking Hop Bitters daily.

Answers to Correspondents.

☞ No Notice taken of Anonymous Communications.

F. H., Bristol, Conn.—Where can I obtain a map of the Adirondack region? Ans. We can furnish them, price $1.

A. G., Kingston, Pa.—Your dog is eligible for classes 33 or 35 according to Westminster Kennel Club rules 14 and 15.

BUNNIE.—You must send your entry to Mr. Charles Lincoln, Superintendent New York Bench Show, 128 Fulton street, this city. Have mailed you premium list and entry blank.

GROVESNER, N. Y.—Your communication is not signed; please send name. For stud services of an Italian greyhound, write Mr. A. B. Moore, 1,711 Spring Garden street, Phila.

J. M., Empire, Fond du Lac, Wis.—Could you inform me if there is any difference between what is called the American jack rabbit and the English hare? Ans. They are entirely different species.

C. D., Worcester.—Will you please inform me if Mr. Frederick A. Ober's (Fred. Beverly) tourograph proved a success; if it will perform all its inventor claims for it? Also, can you tell me its cost? Ans. He so states. Write to the Blair Tourograph Co., 433 Washington street, Boston.

E. Y., Boston.—Will you oblige me with information as to raising sheefs in fresh water ponds, or refer me to any publications on the subject? Ans. There is nothing published except the facts that certain waters have been stocked with them. All that is necessary is to get the fish and transplant them.

H. L., Stamford, N. Y.—Can you give me the address of any taxidermist or collector on the sea coast where aquatic birds, gulls, etc., can be procured in exchange? Ans. J. Wallace, No. 16 North William street, New York, can perhaps send you something. W. P. Neald Pinellas, Hillsborough Co., Florida, has southern skins.

A. L. B., Waterville, Oneida County, N. Y.—Have you any advance sheets or a prospectus for "Coues' Key to North American Birds?" I wish to know if the work is illustrated as all, or wanderer it has exact descriptions only. Ans. The work has some uncolored illustrations. Its chief value, however, depends on its exact descriptions, and its very full introductory matter.

H. M. H., Jackson, Mich.—1. I wish to purchase a 10½-lb. 10 bore, and I want to pay about $60 to $65 (list price). Which is the best gun for that money? 2. Which is the best for glass ballshooting, soft or chilled shot? Ans. 1. There are half a dozen makes of gun to be had at that price, all of which are good. 2 Chilled shot is a little the best for glass balls, though practically there is but little difference.

R. T., Washington, D. C.—1. What is a good pattern, 32-in. circle, 25 yards, No. 12 gun, 2¾ drams powder, one ounce No. 9. shot; weight of gun, six pounds? 2. Will not a good gun send shot through a piece of ordinary wrapping paper, pinned to thin pasteboard (loaded as above), distance 15 yards? 3. How many shot ought same gun put in playing card, distance 25 yards? Ans. 1. About one-half the charge of shot. 2. Very few guns that will do it. 3. Never tried it.

W. B. B., Orange, N. J.—Would you inform me (1) whether the proposed game law for this State has been passed, and (2) where copies of the law, either new or old, can be had? 3. When does the dry season begin in Florida, and how long does it last? 4. What kind of game is to be found near St. Nicholas? 5. Is there good fishing in the St. Johns? Ans. 1. Not yet. 2. Write to your representative for copies. 3. In October, and lasts about eight months. 4. Where is St. Nicholas? 5. Yes.

D., Quincy.—1 Is a ten bore that will put two-thirds of a charge in a thirty inch circle with even distribution and one-half an inch penetration in solid poplar wood as good as I can expect from any medium-priced gun? The charge used was three drams of powder and an ounce of shot, with two wads over the powder 2. Would you buy a 13 gauge? Ans. 1. The pattern is excellent. 2. Depends altogether on the kind of shooting you have.

A. D. E., Irvington, N. Y.—1. How many grains of powder are equivalent to a dram? 2. Have the ducks commenced to come North yet; is there any shooting on Long Island yet and when will be the best time this spring for me to go there for ducks and geese? Ans. 1. One dram avoirdupois is 1-16 of 437½ grs.—a little less than 27½ grs.; 1 dram apothecary or Troy is ⅛ of 480 grains, or 60 grains; 2¾ grains of powder is a dram of powder measure. 2. The birds have begun to come on The last of this month is a good time to go.

F. B. J., Plattsburgh.—1. I wish a gun for duck shooting, 12 gauge, 8¼ lbs. Which would you advise, 30, 31 or 32 in. barrels. 2. Will a 12 gauge, 30 inch barrel burn 4 drs. large grain ducking powder? 3. For such a gun, full choke, would 4 drs. powder, 1 oz. No. 6 chilled shot be a proper load for ducks? 4. Where can I get the Huntingham rules for pigeon shooting? Ans. 1. If you will have a 12 gauge, 30 inch barrels are long enough. 2. Probably not. 3. 3½ drs. and 1⅛ oz. would be better. 4. Write to H. C. Squires, 1 Cortlandt st., for "The Trap Shooter's Referee," price 50 cents.

W. A. N., Newton, N. J.—1. What is the cheapest route to Richmond, Va., and is there any extra charge for dogs? 2. What is the best time to go for quail and deer? 3. Could we get excursion tickets good for two weeks or not? 4. What do you think of the —— gun, $55 grade, and what charge will it stand safely? Ans. 1. Fare by Old Dominion Line $12, by Chesapeake and Ohio R.R. $12.85. No extra charge for dogs, except fee to baggage master. 2. Do not go for quail till after the frost has killed the weeds. 3. You would have to make special arrangements about excursion tickets, we think. 4. A fair gun for a cheap one and will probably stand any load that you want to shoot out of it.

J. M. B., Baltimore.—Can you inform me at what age a Chesapeake diamond-back terrapin is matured, or can you tell me of any work or treatise that is published on the life and habits of the above-named terrapin? Also, if you can give me the address of Mulford Dorlin, who has a terrapin farm on Mobile Bay, Ala? Ans. There is no work which gives the information you require and but little is really known of the age at which terrapin is mature. We have heard fishermen set it from three to seven, and even more, years. This is a good line of research for both the United States and the Maryland Fish Commissions and we will call their attention to it. We have a very interesting letter from Mr. Dorlin on terrapin culture, which will appear in our next.

T., Washington.—Little danger of sinking from filling, except it run down, when any yacht would sink. You would find it impossible to carry as much sail to the sailing length, and a full deck if so carried up to deck height, cockpit might fill without damage. Adopted sloop rig because the boat is small. Rig you mention would require a mainmast in cabin. Raking masts ease a vessel if they are stepped too far forward; otherwise objectionable Practice has shown no advantage in them. On the wind no sail can be a lifting sail. Off the wind the jib is. Sails certainly can be too flat, especially sailing close in light winds, hence mainsails loose on the foot are finding favor. Your spritsail rig good for large, flat drafts, but you could not crowd the necessary sail on a yacht, nor would it be as efficient as a gaffsail on a boat of large displacement. What suits a skiff or bateaux will not necessarily be the best on a larger scale.

E. L. F., Pagosa Springs, Colorado.—1. I wish to get a good book on the ilsies and the fishing of the U. S. 2. I do not wish a work relating mostly to that section known as New England. 3. I want a book mostly about the Southern and Southwestern States; that, is the States south of Mason and Dixon's line and as far west as the Indian Territory, including Texas. 3. Is Frank Forester" and "Halleck's Sportsman's Gazetteer" have. Which of the three following books is the best for my purpose: "Fishing in Am. Waters" (last edition), Genio C. Scott; "Am Angler's Book," Thad. Norris; "Am. Angler's Guide," Brown? Are all these books illustrated? A. No. There is no such book as you require. Mr. Mather was engaged on a work to cover all American waters, but his other labors have prevented its completion Norris' is the best and broadest angling book. We can furnish it. The books mentioned are all illustrated, after a fashion, but Norris' is by far the best.

W. J. L., Attleboro, Mass.—1. Where can I procure reliable maps of the St. Johns River and the east and west branches of the Penobscot? 2. Do you think it would be practical and safe for two young men to attempt without guides either of the trips spoken of by Mr. Steele in his "Canoe and Camera," viz., St. Johns River, east or west branches of the Penobscot? 2. Would you advise taking a canoe from home or buying a birch bark upon arrival at Moosehead Lake? Ans. The map in "Canoe and Camera" is the only map yet issued regarding the routes mentioned, that of the east branch of the Penobscot being drawn from Mr. Steele's personal exploration. 2. It is not safe to go any of those three routes without one guide at least, and two men with baggage is enough load for one canoe. If the second tourist cannot afford a guide, should advise him to "paddle his own canoe," rather than add extra weight to the other. 3. You can hire or buy canoes at Mt. Kineo House, Moosehead Lake, and almost every guide owns one, which is included in his price per day. Be sure and have a clear understanding with guide before starting, or the canoe trip will prove more expensive than anticipated.

—Any subscriber or reader of FOREST AND STREAM in want of any kind of carpetings, oil cloths, rugs, etc., etc., can be sure of fair treatment at the hands of John H. Pray, Sons & Co., Boston. Call or correspond with them, and get their prices before buying. It will pay you to try them.—[*Adv.*

A GREAT OFFER BY A RELIABLE FIRM!

In order to introduce our goods in every neighborhood in the United States we will forward, all shipping charges pre-paid, ANY FINGER RING or PAIR OF EARRINGS, as shown in illustration, provided you Cut Out this Advertisement and send to us with ONE DOLLAR on or before *June 30th, 1881.* If you wish we will engrave any names, initial, motto or sentiment on the inside of rings without extra charge. At the same time we send the article ordered we will mail you a bundle of our catalogues and feel sure that you will be so highly satisfied that you will show your appreciation by distributing our catalogues among your friends and at the same time exhibit goods received from us. You can in this way assist us in selling other goods of standard quality which are manufactured from new and original designs, and which we guarantee to give satisfaction, and if not as represented money will be refunded. Numbers 30 and 37 we furnish in either amythist, garnet or topaz (in ordering please state which you wish). No. 53 is a hand ring, handsomely Chased. No. 29 is set with our celebrated French diamond, being finely cut from the whitest stone and very brilliant; is flawless and not distinguishable in any degree from the destination of the real diamond ever produced, and only experts can detect that they are not. No. 30 has the same setting (French diamond) as the No. 29 ring. No. 88, a beautiful pair of ear-rings, real pearls mounted on elegantly chased anchors. ALL THESE GOODS ARE MADE FROM ROLLED GOLD, AND EACH IS SOLID. We wish to caution the public against many firms who are advertising cheap and worthless jewelry. Our goods are first-class in every particular, and guarantee in offering a few styles of our standard goods at the above nominal prices is to secure permanent customers for other goods. We can only send out a limited number of these goods at price named, and in order to protect ourselves from jewelers and others ordering in quantities, we will insert this advertisement but one time. WE WILL TO ONE PARTY ONLY, AT THIS REDUCED PRICE MERELY TO INTRODUCE OUR GOODS. To ascertain the size ring you wear, take a piece of paper and cut it so it will just go around the finger you wish to wear the ring on, sending the slip to us. In ordering, give Number of article wanted, and if a finger ring, state what you wish engraved. Money can be sent by Registered Letter, Post Office Money Order, or through the regular mail. We refer to any Bank, Express Company, or reputable firm doing business in this city. Address

C. W. PETTIBONE & CO.,
26 Maiden Lane, New York.

STONEHENGE ON THE DOG.

Price $3 50.

For sale by Forest and Stream Publishing Co.

The Kennel.

FOR SALE.—THE BLUE STAR COCKER SPANIEL BREEDING KENNEL.—I will sell reasonably, owing to poor health and increase of private business cares, which will call for all the spare time I care to give in the future, and also enable me to complete my unfinished work on breeding, breaking and management of Spaniels for American Sportsmen. Therefore I offer as above my Kennel stock, all accessories, together with Kennel name and good-will, to any one having the taste and competent to carry on the good work well. The demand for this breed is immense. Over five hundred pups would have been sold last year (1880) from this Kennel had we had them. My price, $4000, is extremely low, considering its well established reputation and lucrative facilities. I will give all time and advice required, gratis, to the successor. One having breeding experience is preferred, and would like to hand over before June next. Only parties meaning business need apply. M. P. McKOON, Proprietor, The Blue Star Kennel, Franklin, Del. Co., N. Y. Mar10,tf

THE FASHION KENNELS offer for sale or exchange the following stock: Rivet, fox terrier dog, 13 months old, white with even black-and-tan head, bred by Wormsley of Liverpool; he is by Forger out of Fanny; price $25. Little Dorrit, wire-haired fox terrier bitch, white with black-and-tan mark on head, 13 months old, bred by C. Burgess, Lincolnshire England; price $20. Carlo Kirke, liver-and-white cocker dog, 9 months old, by Whitman's Carlo, out of Ello Kirke; price $20. Luke Schoolcraft, bull terrier, white with brindle mark on head, body and tail; good on all points; kind, and fit to win on the bench; price $30. Carlo, liver, white-and-tan setter; said to be trained; two years old, and very fond of gun; price $20. I will exchange any of the above stock for fine black, black and tan, or red and white cocker spaniel bitches, or one stud dog. The above stock has each a full pedigree except the setter, and his sire only is known. Address J. H. WINSLOW, P. O. Box 472, Baltimore, Md. Mar24,2t

FOR SALE—Red Irish Setter Dog, Imp. Grifsa, by Moore's Rufus ex Twigg's Kate, 2nd prize, Dublin, 1877; Rufus, by Palmerston ex The Queen; Kate, by Patsy (a Palmerston) ex Moore's Flora, dam of Mina and several other champion and prize bitches. Grifsa won 2nd open class and V.H.C. champion class, Baltimore, 1878, when but 12 mos. old. Only time ever shown.

TO SPORTSMEN.

The Pennsylvania R. R. Co.,

Respectfully invite attention to the

SUPERIOR FACILITIES

afforded by their lines for reaching most of the TROUTING PARKS and RACE COURSES in the Middle States. These lines being CONTINUOUS FROM ALL IMPORTANT POINTS, avoid the difficulties and dangers of reshipment, while the excellent cars which run over the smooth steel tracks enable STOCK TO BE TRANSPORTED without failure or injury.

THE LINES OF

Pennsylvania Railroad Company

also reach the best localities for

GUNNING AND FISHING

In Pennsylvania and New Jersey. EXCURSION TICKETS are sold at the offices of the Company in all the principle cities to KANE, KENOVA, BEDFORD, CRESSON, RALSTON, MINNEQUA, and other well-known centers for

Trout Fishing, Wing Shooting, and Still Hunting.

Also, to

TUCKERTON, BEACH HAVEN, CAPE MAY, SQUAN, and points on the NEW JERSEY COAST, renowned for SALT WATER SPORT AFTER FIN AND FEATHER.

L. P. FARMER, Gen'l Pass. Agent.

FRANK THOMSON, Gen'l Manager. feb17-tf

"THE FISHING LINE."

TAKE THE

Grand Rapids & Indiana R.R.

Mackinaw, Grand Rapids and Cincinnati Short Line

FOR THE

Trout, Grayling, and Black Bass Fisheries,

AND THE

FAMOU SUMMER RESORTS AND LAKES OF

NORTHERN MICHIGAN.

The waters of the

Grand Traverse Region

and the Michigan North Woods are unsurpassed, if equaled, in the abundance and great variety of fish contained.

BROOK TROUT abound in the streams, and the famous AMERICAN GRAYLING is found only in those waters.

The TROUT season begins May 1 and ends Sept. 1. The GRAYLING Season opens June 1 and ends Nov. 1.

BLACK BASS, PIKE, PICKEREL and MUSCALONGE, also abound in large numbers in the many lakes and lakelets of this territory.

The sportsman can readily send trophies of his skill to his friends or "club" at home. Ice for packing fish can be had at many points.

TAKE YOUR FAMILY WITH YOU. The scenery of the North Woods and Lakes is very beautiful; the air is pure, dry and bracing. The climate is peculiarly beneficial to those suffering with

Hay Fever and Asthma Affections.

The hotel accommodations are good, far surpassing the average in countries new enough to afford the finest of fishing.

During the season Round Trip Excursion Tickets will be sold at low rates, and attractive train facilities offered to Tourists and Sportsmen.

Dogs, Guns and Fishing Tackle Carried Free at owner's risk.

It is our aim to make sportsmen feel "at home" at this route. For Tourist's Guide (an attractive illustrated book of 80 pages), containing full information and accurate maps of the Fishing Grounds and Time Cards, address A. D. LEE, Gen. Pass. Agent, Grand Rapids, Mich.

To Hunting and Fishing Parties.

The Pullman Car Company

IS PREPARED TO CHARTER THE new cars "Davy Crocket" and "Izaak Walton," which are fitted up with dining room and kitchen, sleeping apartments, lavatories, etc., also provided with racks and closets for guns and fishing tackle, and kennels for dogs.

Diagrams, rates and other desired information furnished on application to Gen'l Supt. P. P. C. Co., Chicago. je26 3mos.

Wild Fowl Shooting.

Hornbeam Rods

A SPECIALTY.

W. HUNTINGTON,

WILTON, CONN.

Makes a specialty of the manufacture of FINE HAND-MADE RODS of Hornbeam for fly-fishing. Every fly-fisher should have one of these rods, for whatever preference he may have these are the only thoroughly reliable rods, secure against breakage and capable of real hard usage. With one of these rods a sportsman may venture into the woods for a season and take no other rod, and be fairly sure of returning with it in serviceable condition. As made from wood of my own cutting and seasoning, they are powerful, easy in action and full of endurance. For circular send to WALLACE HUNTINGTON, as above.

GUNPOWDER!

Dupont's Rifle, Sporting and Blasting Powder.

THE MOST POPULAR POWDER IN USE!

DUPONT'S GUNPOWDER MILLS, established in 1809, have maintained their great reputation for seventy-eight years. Manufacture the following celebrated brands of powder:

Dupont's Diamond Grain.—Nos. 1 (coarse) to 4 (fine) unequalled in strength, quickness and cleanliness; adapted for glass ball and pigeon shooting. Packed in 1lb canisters.

Dupont's Eagle Ducking.—Nos. 1 (coarse) to 3 (fine); burns slowly, strong and very clean; great penetration, with a close pattern; adapted for glass ball, pigeon, duck and other shooting, with either muzzle or breech-loaders. Packed in 1lb and 5lb canisters and 6¼ and 12½lb kegs.

Dupont's Choke Bore.—Specially adapted for "Choke Bore" Guns, and particularly for prairie and upland shooting. Burns slowly, strong and moist; does not cake or burn on the barrels, gives both a good penetration and a close pattern, will be found well adapted for glass ball and pigeon shooting. Made of two sizes, only No. 7 and No. 5, No. 7 being the coarsest. Packed in 6¼lb kegs and 1lb canisters.

Dupont's Eagle Rifle.—A quick, strong and clean powder, of very fine grain for pistol shooting. Packed in 1lb canisters and 6¼ lb kegs.

Dupont's Rifle Fg. "Sea Shooting."—FFg. and FFFg. The Fg. for long-range rifle shooting, the FFg. and FFFg. for general use, burning strong and moist. Packed in ⅛lb, 1lb and 5lb canisters, 6¼, 12½ and 25lb kegs. Fg coarse, FFFg. fine.

Dupont's Sporting, Mining, SHIPPING and Blasting Powders of all sizes and descriptions. **Special Grades for Export.** Also Rifle, Cartridge, Musket, Cannon, Mortar, Mammoth, Hexagonal, Chemical and Pellet Powder, U. S. Government Standard.

Powder manufactured to order of any required grain or proof.

Agencies in all the cities and principal towns throughout the United States. Represented by

F. L. KNEELAND, 70 Wall Street, N. Y.

N. B.—Use none but DUPONT'S Fg. or FFg. for long-range rifle shooting.

The Hazard Powder Co.,

MANUFACTURERS OF

GUNPOWDER.

Hazard's "Electric Powder."

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of one pound *only*.

Hazard's "American Sporting."

Nos. 1 (fine) to 5 (coarse). In 1 lb. canisters and 6¼ lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to shot guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6¼ and 12½ lb. kegs. Burns *slowly* and very clean, shooting remarkably close and with *great penetration*. For field, forest, or water shooting, it ranks any other brand, and it is equally serviceable for muzzle or breech-loaders.

Hazard's "Kentucky Rifle."

FFFG FFG, and "Sea Shooting" FG in kegs of 25, 12½, and 6¼ lbs. and cans of 5 lbs. FFFG is also packed in 1 and ½ lb. canisters. Burns strong and moist. The FFFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard *Rifle* Powder of the country.

Superior Mining And Blasting Powder.

GOVERNMENT CANNON and MUSKET POWDER; also, SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF, MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's Agents, in every prominent city, or wholesale at our office.

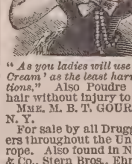
A Skin of Beauty is a Joy Forever.

DR. T. FELIX GOURAUD'S Oriental Cream or Magical Beautifier

PURIFIES as well as Beautifies THE SKIN



Removes Tans, Pimples, Moth-Patches and Blemish on beauty. It has stood the test of thirty years, and is so harmless we taste it to be sure the preparation is properly made. Accept no counterfeit of similar name. The distinguished Dr. L. A. Sayre said to a lady of the *Avant ton* (a patient):—

"*As you ladies will use them, I recommend 'Gouraud's Cream' as the least harmful of all the Skin preparations.*" Also Poudre Subtile removes superfluous hair without injury to the skin.

MME. M. B. T. GOURAUD, Sole Prop., 48 Bond St., N. Y.

For sale by all Druggists and Fancy Goods Dealers throughout the United States, Canadas and Europe. Also found in New York City at R. H. Macy & Co., Stern Bros., Ehrich & Co., L. Bloom & Bro., and other Fancy Goods Dealers. Beware of base imitations which are abroad. We offer $1,000 Reward for the arrest and proof of any one selling the same.

ANSWERS TO CORRESPONDENTS..... 178

TO CORRESPONDENTS.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen.

Communications upon the subjects to which its pages are devoted are invited from every part of the country.

Anonymous communications will not be regarded. No correspondent's name will be published except with his consent.

The Editors cannot be held responsible for the views of correspondents.

All communications of whatever nature should be addressed to the Forest and Stream Publishing Company, Nos. 39 and 40 Park Row, New York.

FOREST AND STREAM.

Thursday, March 31.

WHAT SUPPLIES SHALL WE TAKE WITH US, is a question that has probably vexed the spirit of many a man, and has caused anxious thought to every one who has ever started out to go into camp in the wilderness. There are some men who are contented to live on what they kill during the trip, and who carry with them nothing but bacon, bread and coffee, and there are others who scorn such meagre fare and demand the accessories of condensed milk, canned vegetables, potted meats and preserves. There is no way of transporting edible luxuries so convenient or so safe as in cans, and such goods have been deservedly popular in the past. Lately, however, we have begun to hear complaints, which lead us to imagine either that the goods put up by long established firms are deteriorating, or else that inferior articles are being placed on the market. We have recently received a cheerful letter from a New England correspondent who tells us that a canning establishment near where he resides, sent through the country last winter and bought up all the sheep that had died and all the old poor cattle for use in their establishment. Such a statement is not particularly pleasing to one who is accustomed to depend in part, while in camp or on his yacht on his meats put up in cans. But aside from anything of this kind, what can be more annoying when one is wholly out of reach of the market than to find one's vegetables spoiled and the meats tough or uneatable?

Our readers, whether on land or on board ship, use a great quantity of such stores as these, and they want them good. There must be some reliable houses which deal in provisions of this kind, and we should be glad to know who they are—whom we can feel safe in recommending.

Will some of our readers give us their experience in this matter for the benefit of the fraternity at large?

THE COMING OF THE SHAD.

THE advance-guard has arrived, and the main body, in solid phalanx, may be expected soon. About this time, as the almanac man would put the case, it is in order to scald out the frying pan to take the flavor of the autumnal sausage from its ferruginous pores; scour up the gridiron to remove all suspicion of chops, steaks or oleaginous mackerel; but if you plank your shad simply wipe the dust from the plank, for it is held that the longer a plank is used the more its pores become filled with the essence of previous shads, and the less can therefore be extracted or absorbed from present ones.

The extension of lines of travel have enabled New Yorkers to eat shad nearly all winter, beginning with those of Florida, and after consuming quantities of them they take from the more northerly rivers in turn until the run begins in the Delaware and the Hudson, or "North River," as they locally call it. This has tended to entirely destroy the romance of the coming of the shad, which was formerly hailed with delight by the old Dutch settlers as a relief from the spare-rib and "oelecoeks" of winter. In those days it meant an unlimited supply of a new food, and great was the rejoicing at the capture of the forerunner of the school of clupeoids which were as certain to come after as the dogwood and shadblows were to bloom. In ye olden time the advent of the shad was a thing to talk about, and Muynheer has been known to even let the fire in his pipe die away in his haste to convey the news over the old half-door to his neighbor on the other side of the way, how Pieter Weindirk and "Brommy" Van der Kuinck caught a shad in their fyke by the Battery this morning. Later than this, within our own short memory, the crack hotels paid prices from twenty-five to fifty dollars for the first Hudson shad, and it was announced in all the city papers that the enterprising proprietor of the Asterisk House had served up the first shad of the season to his guests at the price above named. Alas! he comes as unheralded and unnoticed now as the Member of Congress from Sawlogville, who wonders if the people will close their stores on his arrival; and so many Southern shad have preceded him that his identity is lost, and instead of a pioneer leading a mighty host he is simply a shad whose only credentials are the word of the marketman who certifies to the fact that he bought it of a fisherman who caught it at a certain place; but in appearance it is not to be distinguished from its fellows of the Chesapeake who have graced the slabs for weeks before, except perhaps by a slight fullness in the eye which denotes the freshly caught fish.

We feel sorry for the man who does not long for the season of succulent shad, and for the man who "likes 'em if 'twasn't for the bones." We grieve for the former because, perhaps, he never ate shad, except small ones; and your real shad lover abominates a small one, dried up, perhaps, in a pan, and wishes that he could sit down to a juicy six-pounder quickly broiled or planked. The latter—the bone man—has our sympathies, because he does not know that shad were made to linger over and enjoy and not to bolt as our African brothers do their ham and eggs; and besides, shad are not suitable for the railway lunch where "twenty minutes for refreshment" are shortened at both ends until there is actually only half that time available. Moreover, he knoweth not that a shad or other fish is not to be cut across like a slice of liver, but that the fork must separate the layers of muscle between which lie the small bones, which in cutting are inextricably intermingled with the flesh. He knoweth not that the shad is built upon a correct plan, and that it is his piscivorine knowledge which is at fault; but we will tell him at every opportunity, so that he may yet learn to enjoy one of the finest fishes which the palate of the man whose ichthyophagic education has been complete knoweth of.

The first shad is usually taken at New York on or about St. Patrick's Day, blessings on him for it; for perhaps if the Saint had not existed we would never have known to what a height a form of herring could attain. Think of it! As Ireland owes her freedom from snakes to St. Patrick, so America owes the shad to him. The admirers of St. Patrick vehemently insist that he was a gentleman. We believe it. Why they so strenuously insist upon his gentility we do not know. Perhaps it was an unusual quality in a saint; but, be this as it may, we hope that while his memory endures the snakes will not invade Ireland nor the shad desert the waters surrounding Manhattan.

WE CALLED ATTENTION LAST WEEK to an admirable provision in Assembly Bill 242, in which a bounty is offered for vermin. Some such excellent amendment we hope to see added this session to the existing law.

There are other sections of this bill, however, which by no means recommend themselves to the public. Section 2, for example will call forth the unqualified disapproval of all shore gunners. It provides that "No person shall kill, or expose for sale * * * * any * * * * rail, snipe, plover * * * between the first day of May and the first day of September, except in the waters of Long Island, *in which waters* none of said birds shall be killed between the first day of May and the first day of October. Any person violating," etc. This provision would certainly appear to have been drawn up by some one who was wholly unfamiliar with the shooting along the tide water flats and marshes of our sea coast. By the introduction of such an amendment to our law, the rail and the bay snipe shooting would be practically abolished in this State. By the first of October the rail shooting is about over, September being the month in which these birds are found in our marshes in the greatest abundance. We usually kill a few birds after October first, but no counts are made as late as that which will compare with those made about the middle of September.

The bay birds commence to fly in July, and often the height of the shooting at dowitch and jack is during that month or early in August. By the first of October none of these birds, except a few stragglers, are to be found on the Long Island shore.

We have assumed that the word "snipe" here used is a general term employed to designate bay snipe and shore bird, and as it is immediately followed by the word "plover" this inference seems a fair one. We think that all will agree that the section alluded to is an unfortunate one and should not be passed.

THE FACTS IN RELATION TO THE ANNUAL DESTRUCTION of deer in Michigan will certainly be read with interest by every one. There are at present but few localities within reach of large cities where a man can go with any reasonably fair prospect of having any deer hunting. Minnesota and Michigan are two States in which this game is still abundant, but in which, unless steps to check its slaughter are speedily taken, it will not long remain so.

There is much to be said in favor of the proposition to enact a prohibitory export law, and there is little doubt that such a measure would meet with general approval among a large class of sportsmen. On the other hand, it would have to encounter the most bitter opposition from those who shoot for the market and those who deal in game. Such a law, however, would certainly protect large game, for if it were illegal to carry game out of the State no one would kill more than he could use on the spot. The market hunter's occupation would be in a measure gone, for he would only kill what could be bought and consumed within the limits of the State. A provision taxing the green hide would probably do good work in supplementing the Prohibitory Export Act and would so raise the cost of the hides that it would be no longer profitable to kill the deer for these alone. This question of the protection of large game is one that demands the immediate attention of those interested in game preservation, and we are glad to see the Michigan sportsmen, through their able and energetic representative, Mr. Roney, taking hold of the subject in earnest. It is so much easier to preserve the game now, while there is some left, than it will be in the future to attempt to restock districts from which the idigenous *feræ naturæ* have been exterminated, that it is worth while to make great efforts to save what yet remains to us.

AMONG the "dogs" recommended or suggested as useful for killing woodchucks are the fox terrier, the dachshund, the spotted turtle and the steel trap. Surely with all these assistants our farmers ought to be able to clear the pests from their gardens and clover patches.

A Successful Newspaper.—It gave us great satisfaction a few weeks ago to compliment the *Commercial Advertiser*, on its general appearance and readable columns. Again we are obliged to note the great change made in its appearance since last Monday. The paper has been enlarged to 36 columns, the "make up" changed and altered for the better, and it is printed from the newest invention in presses. A type web rotary press, made by R. Hoe & Co., capable of printing 22,000 perfect sheets an hour, has been added to their press-room, and the paper may be said to be in perfect shape for any and all kinds of work. This is an evidence of prosperity and a good bank account on the part of our aged contemporary. The columns are as young as ever, and filled as usual with bright and clever hits. The advertising columns also appear fuller, and everywhere the impression is that the *Commercial* is the leading afternoon paper of this city. We congratulate the *Commercial*, and utter the wish that its prosperity in the future will be as solid as it is at present.

A Letter purporting to be written by D. C. Sanborn has recently been published, in which he complains that a communication addressed by him to the Forest and Stream was mutilated in publication. The letter in question contained a considerable amount of matter which had no bearing whatever on the point at issue, which was a difference of opinion between "Fritz" and Sanborn. On the receipt of the latter's communication he was written to, on the 28th of February, that we would publish that part of his letter which referred to him personally.

The letter was held over our issue of March 3 in order that his reply might be received, and, as nothing was heard from him, we assumed that he was satisfied with our offer and his letter was printed. Does it take eleven days to receive a reply from the town where Mr. Sanborn lives? We usually can receive replies from there in half that time.

It is evident that the Forest and Stream's strictures on the dishonorable practices of certain unprincipled dog handlers have cut them deeply, for the snappings and snarlings at our heels are loud and continuous. Mr. Sanborn we believe to be a very honest and worthy man, but we cannot congratulate him on the company he has got into. The bark of this crew is worse than their bite, however—if they have any bite.

The Charming Story of the two little gray foxes so delightfully told in another column by an English lady resident in Virginia, teaches a lesson that all may study with profit.

There is no animal that is by nature wilder than the fox, and yet by kind treatment and constant association with man even these wild creatures may be rendered docile, companionable and fond. Each experiment of this kind that is related confirms the belief that only patience and perseverance are needed to render the wildest animals contented under domestication. The instances of ruffed grouse being tamed, recently cited in these columns, bear directly on this point, and every year's experience leads us to hope that the day is not far distant when many species of our wild game may be bred in the domesticated state and may thus afford a constant supply from which our covers may be stocked.

There is in England a Children's Society for the protection of birds, and it is said that the membership now numbers over 23,000. Each child who becomes a member takes a pledge as follows:

"I promise to be kind to all birds as far as I can; to feed birds in winter with spare crumbs instead of wasting them; not to molest or disturb birds during their building season; not to rob the nests of their eggs or to tear out the nests; not to kill the young ones or otherwise injure them; to try and induce others to take an interest in these beautiful creatures, and promote the objects of the society."

On the Wing.—Early next spring Col. E. Z. C. Judson, "Ned Buntline," will leave the East on a visit to the Ranch of Buffalo Bill and Frank North, the Chief of the Pawnee Battalion in Western Nebraska, thence to Denver, Colorado, and still further to New Mexico, to see to interests he holds in the Lode and Placer Mining Co., now working a heavy force near Fort Craig. He will send a condensed report of all he sees that tends to sporting interest to us while gone.

If the Bench-Legged Beagles are really basset hounds, as General Bond in his letter printed in another column hints, by all means let them be called so. This strain of dogs is recognized at all the English dog shows and is classed as a distinct breed, quite as much as mastiffs, poodles or bloodhounds.

The very clear statements of fact in General Bond's letter seem to be a conclusive reply to the insinuations that the bench-legged dogs of Maryland indicate a dachshund cross with the straight-legged beagle.

The Rules of the Toronto Gun Club, revised for 1881, contain in a very small space a large amount of valuable information. In addition to the Constitution and By-Laws of the club and the rules for trap shooting, there are printed the game act and the laws affecting the fisheries of the Province of Ontario, the whole forming a compendium of great value. We understand that the Toronto Gun Club will be glad to exchange copies of their rules with any other gun clubs or sportsmen's associations.

The American Fisheultural Association.—The annual meeting of the Association is taking place as we go to press. Our next issue will contain a full account of the incidents, papers and discussions.

The Sportsman Tourist.

WILD TURKEY HUNTING.

Now and then we have an item in Forest and Stream on turkey shooting, and as the idea seems to prevail that large shot is a *sine qua non* for this kind of game and as my experience puts me in a position to say something on the subject, I propose to give some of my views and add a few incidents which may not be uninteresting to your readers.

Twenty-five years ago this was a locality fit to gladden the heart of any not over-exacting sportsman. Here were quail, woodcock, snipe and ducks in thousands, with wild turkeys in flocks numbering sometimes hundreds to be found in all directions; and here my father and I indulged our intense love of dog and gun, limited for years only by such laws as govern sportsmen who need no statutes. In season we turned our attention to all the varieties of game mentioned; and it was not uncommon when hunting quail in briery or grassy coverts to come suddenly upon wild turkeys which, taking wing, sometimes afforded the delicious opportunity of a successful "double," and many an old gobbler thus abruptly gave up his life to a charge of No. 8 shot, fired from a seven-pound, fifteen gauge, cylinder bore, muzzle-loading gun.

This need not seem incredible, as it is a fact easily explained. It may not be generally known that the head and neck of a turkey is exceeding vulnerable; but to such an extent is this so, that a single pellet of No. 8 in the head at forty or fifty yards will prove instantly fatal; so considering the closeness of a No. 8 pattern, even of a cylinder bore, a turkey with its head and long neck exposed at thirty or thirty-five yards has scarcely a chance of escape, and with a good choke-bore I should expect to kill almost certainly with each shot at forty yards.

On the other hand, it has frequently happened within my knowledge that turkeys shot through the body with several buckshot or a rifle bullet, if not afterward by the merest good fortune found and secured by another shot, escaped to die or recover from their wounds. For example, I will mention two or three of the many instances to which I might refer. A flock of about a hundred wild turkeys was scattered one evening at roosting time and a party of four of us went to the place next morning before daybreak with the intention of calling. One of the seven turkeys killed on this occasion was to all appearances active and sound as any of its companions; but picking revealed that a rifle bullet had entered about an inch to the left of the tail and passed out at the breast within an inch or two of the neck, thus traversing nearly the full length of the body. Yet this wound was almost healed.

While hunting deer in one of our northern counties a companion was taken sick and had to return home. He left his gun (a double-barreled rifle) with me, thinking I might sometimes prefer it to the shotgun which I was using. Not far from the house at which I stopped was a large stubble field bounded on two sides by a deep forest. Knowing that wild turkeys were in the habit of feeding in the field I concluded to take both rifle and shotgun and steal a march on them. Loading the shotgun with No. 6 shot I made a detour into the woods and stealthily approached the field. Looking cautiously over the fence I discovered in the centre of the field, at least a hundred yards away, a flock of turkeys unsuspiciously feeding.

Knowing the probability of getting either a single or double wing shot with the shot-gun should I fire the rifle before they observed me, and fearing to wait for a better chance lest I be seen and lose all, I leaned the shot-gun ready for use against the fence, selected my turkey and fired. I saw that the bullet had taken effect, but the turkey, with much difficulty, managed to rise, and with the rest of the flock come directly toward me. Quickly changing guns the prospect was now quite pleasing, but I determined to secure the wounded bird if I got no other. I, therefore, kept my eye on the laggard, and as he gave me his side I fired and killed him dead. Turning quickly to shoot the second barrel I found that the others had entered the tree-tops overhead and escaped. Thus I lost the opportunity to make a double shot, but secured a fine turkey, which, though shot through with a ball weighing fifty to the pound, I should have lost, but for that fatal No. 6.

Next day I went again with both guns to the same field, but this time I approached it on the other wooded side. Near the same spot which the turkeys occupied on the previous day was a single turkey and about the same distance away. At the crack of the rifle he fluttered around in every direction trying to rise, and finally succeeded in clearing the the stubble, going directly away from me, but after getting a start he circled around and came straight toward me. When close enough I let him have a charge of No. 6 which sent him almost perpendicularly more than a hundred feet high, where suddenly his life ended, and he fell with a tremendous thud almost at my feet. The rifle bullet had gone through about an inch back of the centre, just as the one of the day before had done.

While the latter two incidents serve to show what fine shot may do and how a bullet may fail I consider them also worthy of mention as something remarkable, that on two successive visits to the same field, and yet from entirely different positions, so nearly the same train of circumstances occurred.

It happened often enough that turkeys and sometimes old gobblers, presenting a side shot with the wing raised, were killed with No. 8 shot by hitting in the body only, but for body shooting no one who has tested the matter is better aware than myself that No. 8 is too light. For many years my father and I preferred No. 6, and very rarely used anything larger, but later I adopted the plan of loading one barrel with No. 8 the other with No. 3, and in doubtful cases firing both at once. This gave most gratifying results. But now that guns are changed my theory would be to load one barrel of a good choke bore with No. 8 the other with No. 1.

Our usual method of hunting turkeys was by the aid of a pointer trained to take the trail, and follow it as rapidly as possible, giving tongue only when one or more birds were forced to take wing, and then returning to take the trail of any that had not flown, forcing them to flight in the same manner, and repeating this so long as a trail could be found. Then if in heavy timber discretion was used as to the best location for a blind, and one hastily constructed of chunks, sticks, bark or anything suitable at hand. Entering this with the dog, and placing the gun in readiness for quick work, should it be necessary, a bone from the wing of a turkey was employed in imitating the call. This generally elicited an answer from some already lonely and anxious turkey, which possibly came rushing almost into the blind before the bone or caller could be carefully laid aside and the gun brought to bear. I once had a turkey come so quickly upon me that before I could catch up my gun and shoot he jumped on the log behind which I was hidden, within a foot of my face. The result was a beautiful opportunity for a flying shot, which terminated his career, but I have always been sorry that I did not grasp him by the legs.

Some flocks sometimes will come thus freely to the call, and there have been times when there was no reason to doubt that had I been so disposed I might have killed nearly if not quite all of the flock. I have, however, killed as many as five from a single blind within about an hour. Then, again, a flock may be scattered which calls more or less freely, but will not come where no turkey is to be seen. Others are not disposed to call at all, but now and then if calling is good, the blind close and no movement of the hunter has been detected one of them will cautiously and silently approach quite close before any discovery is made either on the part of the hunter or turkey. The surprise in this case is generally mutual. And some flocks cannot by any means be induced either to call or come. I once killed at intervals by one means or another, eleven out of a flock of twelve turkeys; but though they were often most thoroughly scattered I never could by any posibility get them to answer my call or come. Nor did I ever hear them call under any circumstances.

When turkeys are found where high grass, weeds or briers abound they are apt to hide like quail and will lie to the point of a dog, or until the hunter approaches within a few feet of them, when if there is considerable cover through which they can run easily, they will often try to make their escape on foot; but if the cover is too dense for that, or so scattering that they must clearly expose themselves, they take wing. A flock so scattered affords the grandest of sport. No calling then, only a search through the cover as for quail, flushing a turkey here and one there, until, perhaps, in sheer ecstacy one is tempted to kill too many. My father once scattered quite a number of turkeys in a little prairie thickly overgrown with boneset in which they hid. Hunting this, he flushed and killed six turkeys, once, at least, making a double shot. He then quit, without knowing how many more he might kill, the remainder of the flock being still in hiding there.

"F. P.," in a late number of Forest and Stream, tells of his astonishment at killing three turkeys at a single shot with No. 4. But I shall not be surprised if some day I kill three times three with a single charge of No 8, provided I can get their heads together in such a way as sometimes happens, and as I still hope will yet happen to me. My father once scattered a flock of turkeys, built a blind and commenced calling. Pretty soon three turkeys came up, and, waiting until their heads were in range, he fired, killing all three at one shot with a fifteen-bore gun weighing less than seven pounds, and loaded with two drams of powder and an ounce of No. 6 shot. This is better than "F. P.'s" performance, as there were but three turkeys and the shot was two sizes smaller.

Some years ago I was stopping at a friend's house in a vicinity where wild turkeys were plenty. There was a large wheat stubble not far away which they were in the habit of visiting. One day while my friend was plowing this field, some turkeys came in to feed over the freshly plowed ground. They kept a respectful distance between him and them, but evidently were not much afraid. Leaving his horses and plow he came to the house and told me that the turkeys were in the field, and then went back and resumed his work. I took my gun, a 13-bore muzzle-loader, charged with one and a quarter ounces of No. 6 shot, and slipped around to the far corner of the field. Peeping carefully through the hazel brush that grew in the fence corners, I saw five turkeys feeding slowly along and coming parallel with the fence toward me. I carefully changed my position for a more favorable one a little further up the fence along which they were coming. Here I lay down, placed the muzzle of my gun through the fence and awaited their arrival. As they were passing about thirty yards distant I managed to get three heads and necks in range, and fired. Without waiting to see the result of my shot, I sprung quickly to my feet, and as two turkeys were winging their way out of the field I fired at one of them and brought it down. On looking around I found that I had killed four out of five large turkeys, three with the first barrel and one with the second. My friend was so elated over it that he took his horses from the plow, tied the turkeys together, laid them over the back of one of the horses, and thus took them to the house, where he remained the rest of the afternoon.

Though I have already filled far more space than was intended, there is one incident so remarkable that it ought not to be omitted. Some years ago a friend of mine, with five or six others, went one night to shoot turkeys on the roost. After hunting them for a while and firing some unsuccessful shots, they were about to abandon the hunt, and had gathered under a tree where, for some time, they were laughing and talking. One of the party who had loaded his rifle in the dark was not satisfied as to the result, and proposed to fire it off. Pointing it toward the root of the tree, he was about to do so, when he remarked that he was afraid to shoot it, and hesitated. My friend said, "Here, give it to me. I'm not afraid." So, taking the gun, he also held it toward the root of the tree, and was about to press the trigger, when it occurred to him that there might be some danger in firing it in that position. He therefore laughingly remarked, "Wait and I'll kill a turkey." Accordingly he held the gun as far above his head as he could reach, and, pointing it up into the tree-top overhead, fired. Their consternation may be imagined when right into their midst dropped a turkey which no one had the least idea was in the vicinity. On examination it was found that the ball had struck centrally between the thighs and passed out at the back. The fact that this was done at night with a rifle, without aim, and without the knowledge that a turkey was there, is very wonderful, and certainly worthy of record.

While I regard the events herein referred to as worthy of note, there is no doubt in my mind that, with the exception of the last, they have been more than eclipsed by the performance of others. I have heard of many more than three turkeys being killed at one shot, and, with my knowledge of the subject, readily recognize the probability of its truth. Hoping, therefore, that on this topic we shall have many items of interest reported for record in Forest and Stream, I, for the nonce, refrain. Splasher,

Ohio, March 17, 1881.

"A TRIP THROUGH THE PROVINCES."

CONCLUDED.

"Whom the gods would destroy they first make mad."

I TAKE up my pen for the last time I hope in the discussion of a much hackneyed subject, by way of a parting shot at my esteemed critic "Mic Mac," toward whom I did not intend to be "savage," but only earnest. The "opinion" expressed in my reply to his article that I did not believe he ever took a salmon or knew anything of the fishing qualities of the rivers named was based upon the tenor of his article, which reflected the idea that either he must have enjoyed good sport on the "debatable ground," and desired to keep others away, or he knew little of it. In my review I determined to bring this information to the surface if possible. I surmised if I assumed the former proposition to be the fact and so charged it I should provoke no denial of my charge, whereas if I assumed the latter to be true then he, true to the instinct of sportsmen in general, would d in his pride, would "give himself away" if the former were true, and it would seem my guess was not a bad one. I have, therefore, accomplished what I sought to prove by my adversary, viz., that salmon may be taken in goodly numbers on the rivers under discussion, and the question of "expenses" every reader can pass upon for himself from what follows. Having said this much I most cheerfully withdraw any seeming "savageness" toward my critic whom certainly I did not intend to offend, and I humbly crave pardon for having assumed for a moment that he lacked knowledge and information regarding salmon fishing, with which he seems to be *au fait* (O-Fay).

Now, a word as to whether "Mic Mac" is dealing fairly with our fraternity in advising them that my "statement of the possibility of getting good salmon and trout fishing * * * in the space of two or three weeks at very moderate cost" is an "exaggerated account of the chances of salmon fishing" (see his article Feb. 24, 1881).

Now, confessedly, you went there in the fall, which is not the season of salmon, but June and July is. Secondly, you "devoted each year the first part of our vacation—*i. e.*, from six days to a fortnight—to salmon fishing, and the rest to shooting" (F. & S., Feb. 24, '81).

"In 1878 a friend and myself were in camp fourteen days on the Nepissiquit River, part of the time on 'Rough Waters,' when we paid the Government license of $1 a rod per diem. * * * During this trip we killed thirty-two fish, salmon and grilse."

The next fall you fished but two days and took but two salmon, while last year in ten days you "killed eight salmon that averaged nearly 19 lbs."

This, however, was at Gaspe, where you under-leased a river from a friend, and you further say that your friend, at the close of your first trip, after you "had enough fishing for that season * * * went up the little southwest branch of the Mirimachi * * * and killed six or seven fish;" and yet you say later in your article that "I returned there because I liked the country * * * and had sport that satisfied me, although it has been by no means phenomenal."

Shades of Isaac Walton! "Mic Mac," your modesty is truly shocking!

In two weeks' time you and your friend killed "thirty-two fish, salmon and grilse," and that was nothing to emphasize, while you say later, "These scores are not very large ones, but still they show that we did have a certain amount of salmon fishing." Well, I should so remark! Yes! yes! So you did, "Mic Mac." My shaft hit hard, friend, and you s-did out.

Now, on neither of your trips did you devote over "six days to a fortnight to salmon-fishing." Now, will you explain the following, contained in your last article: "But I do say, and know, that it is not to be got (*i. e.*, salmon-fishing) by anybody who happens to get two or three weeks' spare time and has a hundred dollars in his pocket, and anybody who starts off with any such idea will come back sold?"

I ask now *de* the question of time. Let the reader answer.

Now, as to expenses, my statement was $150 for two weeks, in the first article, and in my second that I actually made a twenty-day trip for $100. Now, let us look at this question just a moment. You say yourself: "Guides and canoes are cheaper and the cost of board at the taverns and inns is less" than in the Adirondacks or Maine. Let us "figger" together, brother:

Fare, Boston to Restigouche and return, either via Quebec or back same way	$30.00
Eight days' fishing, two guides and canoe, board self and guides, $6.50 per day	52.00
Seven days' board for self	14.00
Total	$96.00

Now, where is the error, if one? There is not one single hotel in New Brunswick, to my knowledge, which charges in excess of $2 per day, and most of them are less by the single day. The estimate of $6.50 per day while salmon-fishing was based upon experience, and we boarded at Fraser's Hotel, guides included, while camping reduces expenses in this direction.

The fishing grounds of the Mirimachi are within easy approach from Newcastle, on the Intercolonial Railroad. The Northwest Branch—"Big Hole"—is twenty three miles from Newcastle and easily accessible by private team. John Hare will keep you, though the fare will be very plain and prices very modest. "Southwest" Branch, at Indiantown, seventeen miles from Newcastle, is the other place, reached by small steamer or teams; small inn kept by Frank Jardin.

The fishing grounds of the Nepissiquit are reached from Bathurst on the railroad. "Rough Waters" are about ten miles up river and Grand Falls about twenty miles further up, reached by canoes or team. What fishing is now to be had on the Restigouche is reached from Campbellton on the railroad. Trout-fishing near at hand, with possible chances of salmon below the New York Club pool. Since their advent, however, the main chance is gone here.

Now, it will be seen all of the fishing, whether good or bad, is of easy access and at moderate expense. From Campbellton to Gaspe a steamer runs every week; fare down and back last year, if my memory serves me right, $7 (we did not take the trip).

Now, a single word with regard to "poaching," "sponging" and that sort of thing. Every trout-fisherman is anxious to try for salmon. In going to New Brunswick he is sure of finding plenty of trout, for "Mic Mac" says so and I agree. He can make the trip here as cheaply as to New York woods or Maine and take his chance for salmon. If the season should prove favorable the chances are promising of his worthy ambition being gratified; for, first, there are several places where, upon the payment of the small fee of $1 license per day, he can try. Failing here, if he wishes to plunge into the wilderness, as "Mic Mac" did, there is "sea-room" there that is not leased, or at all events may be fished with impunity by anybody without being called "poachers."

A very large per cent. of the salmon rivers in Canada and New Brunswick are leased, and yet it is not an uncommon thing for a few days' fishing to be granted to strangers, nor is it called "sponging." I agree with "Mic Mac" if there were no fishing ground for trout or salmon but what was leased I should not care to go there relying upon chances, but with the honorable arrangements that can generally be made, if your own ground fails, which is not likely in a fair season, I should not hesitate to try and get a chance with some one who had a whole river to himself.

"Mic Mac" says "that to hire a river * * is beyond the limit of our purses." Well, this is also encouraging. I was fearful heretofore that he was one of those purse proud "fellers" of Boston; but as he is poor like the rest of us, and as he has done some pretty tall fishing without "leasing" or "sponging," and as I have been content also with my success there, under like treatment, why may not another try his chances there?

However, let us rest here awhile. I will reel up my line and unjoint. I will not refer to the defence on the inaccuracies of my "bill of costs." If I did not tax it correctly I would have amended if asked to do so. Neither will I discuss with my friend the "dog" question. I am not much of a shot anyhow, yet I think I can beat him on "misses" out of a possible hundred. I have no doubt his judgment is superior to mine on the hunting question in New Brunswick, and I cheerfully yield to his opinions and experience. I also cheerfully forgive his crushing remark, bristling all over with sarcasm, that he does not, "on the strength of a few weeks annually spent in the woods, feel competent to give advice to anybody on any subject."

Yet I am sorry he has made this announcement, for if we cannot hear from those who have ripened with information by such experience as "Mic Mac" has had from whom shall we expect it?

But let this suffice for a reply to "Mic Mac." Our words have been many, but I trust not venomous, and withal they have provoked a little information, which I trust will be relished by those who contemplate visiting the Provinces. And let us hope that neither you nor I have lost anything—not even our tempers—thereby. May you live to kill many salmon, and may your gun never miss fire, is the heartiest wish of your Reviewer.

I would be glad if my article might stop here, but I do not feel willing to suffer misrepresentation, nor am I willing that the readers of FOREST AND STREAM should be misled by any misinterpretation of previous articles from my pen, hence I am led to inquire why does "Manhattan" persist in misrepresenting the tenor of my articles?

In an article published in the FOREST AND STREAM under date of March 10, 1881, the last named gentleman retires from the field of discussion as to the question of there being "good salmon fishing" in New Brunswick, but differs with me on the question of expenses.

That, I confess, is legitimate warfare, if he deals with my previous articles as I wrote them, and does not by innuendoes lead the reader to believe I wrote something entirely different from what in fact I *did* write. I will not say that he does this purposely, but the effect is perfectly apparent. I quote:

"To fly fish for salmon properly also each angler requires a canoe managed by two canoemen. This costs money. I cannot comprehend any enjoyment or success in having two anglers in one canoe, as must be done if the trip is to cost within or near Mr. Fay's figures. Fancy two lines, each with a twenty-pound salmon on, from the same canoe! Or fancy a man traveling '1,757' miles and then taking turns with three friends in fishing from the same canoe!"

Now, really, "Manhattan," your insinuation is unworthy of you. You know if I ever saw a salmon taken I could never have "figgered" "two anglers in one canoe." My arithmetic may be bad, but I never could have blundered on the propriety—aye, necessity—of having two guides for each angler. Nor did I write so; nor did you understand me to have written so; nor have you any right to insinuate I did write so. And here is just what I did write in FOREST AND STREAM in the issue of March 10, 1880:

Expenses of Fishing at Restigouche per Day.

Board (self)	$2 00
Board of two guides (per day)	1.50
Permit to fish	1.00
Canoe	50
Two guides per day (wages)	1 50
Total expenses per day	$6.50

"As the water is very 'quick,' two guides are indispensable per man. Estimated expenses for two weeks' trip from Boston to Restigouche, $150."

Now the above is exactly what I did say, and I here repeat it with this addenda: that a two week's trip to that region can be made for $100, even money.

"Arithmetic" is my stronghold. You may chase the salmon back to the sea, or into the New York Club pool, but I'll surrender my "figgers" never—no, never!"

Recapitulation.

Ticket—Boston to Restigouche and return	$31.50
Six days after salmon @ $6.50 per day	39.00
Eight days remaining of two weeks' trip	16.00
Incidentals	13.50
Total	$100.00

In my estimate of $150 for the trip, as before remarked, I allowed a very wide latitude for all sorts of extravagances. The sum seems a low one, I confess, but the solution is this:

Aside from St. John City I now recall ten different hotels we stopped at, and at none of them was the charge in excess of two dollars per day, and from that down, and by the week, rates at $2; homes are about $10. Guides can be obtained readily from 75 to $1.50 per day, other things in proportion. There is no place in this country where expenses are lower than in N. S. and N. B. In the matter of guides, for instance, at the Adirondacks I find $3 per day; at the Rangeley's, $2.50; at Moosehead, $3 and $3 50.

Salmon and trout are as plentiful at New Brunswick as anywhere, and having said this I am quite prepared to agree with my critic, "Manhattan," that "salmon are proverbially fickle," and ditto trout I could add—and this I said before—go where you will, and you are liable to disappointment, and you may wish you had gone somewhere else. "A rolling stone gathers—no salmon," says "Manhattan." True. Neither does a selfish or jealous sportsmen gather any friends.

Since writing the article which has provoked these discussions I have received several letters of approval from brother sportsmen who "have been there," notably Charles Hallock, formerly of the FOREST AND STREAM. So it would seem that my views are not entirely unsupported.

In conclusion, let me say that I presume all anglers do not go for fish simply, but to see the country, to study its resources and products, and get an outside view of this microcosm of theirs. To those would I say, Go hence. The United States is not the whole world. You will find a new people and a new land, and feel kindlier from contact with the "Blue Noses."

Your curiosity will readily be awakened by the high tides—best seen at Moncton, N. B.; a pleasant country lying along the St. Lawrence Bay will greet the eye, and you will realize that you breathe a different atmosphere than at home. Suppose you catch no fish you will not be "swindled out of a good holiday." Kind reader, in conclusion I commend to your careful perusal the introductory in W. C. Prime's "I go a Fishing," he is a type I would imitate, for he breathes the true sentiment of every loyal sportsman.

"But be warned in time. The best of anglers does not always find fish, and the most skillful casting of a fly does not always bring up trout. * * * It, however, you have the true angler's spirit, and will go a fishing prepared to have a good day of it, even though the weather turn out vile and the sport wretched, then turn over the leaf and let us be starting."

My very, very, amiable brother sportsman, "Manhattan," I cordially give you my right hand in full faith and fellowship.

Meriden, Conn., March 14. GEORGE A. FAY.

WISCONSIN SHOOTING GROUNDS.

WISCONSIN abounds in small lakes, rivers and ponds, made attractive to water fowl by the generous supply of wild rice, and in some instances celery, which they produce. The happy hunting-ground toward which the sportsmen of that portion of the State included in Winnebago and Waushara counties journey includes portions of the Wolf and Fox rivers, and lakes Poygan and Butte des Mortes, with their great expanse of adjoining marsh, ponds, sloughs, etc. Lake Poygan is a body of water of some pretensions as to size, being ten or twelve miles in length and three or four wide. At its northwest corner is situated the little village of Tusten, comprising a hotel, two or three stores, a sawmill and a few dwellings. Nearly the entire western and southern shore of the lake is of a marshy character, a portion being used as hay marsh, but all overflowed in spring and fall and producing in abundance the food which delights the palates of the duck family. At Tusten is a hotel, the Le Fevre House, where good fare, clean beds and reasonable rates are attainable—the latter being a dollar day, which included, in our case, the use of a boat. Starting from Tusten one has but a short paddle of a mile or two before a favorable spot to locate may be found; in fact, a gunner may establish himself almost anywhere along the edge of the lake on a favorable day and not go amiss. Back on the marshes, accessible for light boats and wadeable for hipboots, are many holes in which mallards love to congregate for their night's rest. Located in a convenient cluster of willows with boat drawn well in and a good retriever, the sportsman is certainly exacting who cannot get his money's worth in the hour preceding darkness. I never have felt the need of nor the ability to pay for that expensive luxury called a "punter," which I take to be man to do the hard work of such a trip, but have no doubt a small sum per day could secure the services of any of the several qualified persons who have their home at Tusten.

Within a distance of three miles from Tusten along the western shore of the lake three streams empty their waters into Poygan. Pine River for some distance from its mouth runs through marshy ground, and on either side wild rice is abundant. There is a stiff current, rendering shooting up stream almost impossible for a single canoeist; but at certain seasons fine sport may be had by paddling up to the timber and then floating down stream, "jumping" ducks. Pumpkin Seed Creek is very similar at its mouth to Pine River. I have never followed it any distance up, but presume it affords equally good facilities for sport. Willow Creek, the larger of the three, threads its way for many miles through a regular paradise for ducks. The writer has followed it from Auroraville—some twenty miles above its mouth—to the lake, and for nearly the entire distance on both sides are marshes abounding in ponds, sloughs, etc., and producing rice in profusion in which game *galore* may be found. But in traversing this creek in hopes of "jumping" ducks one needs a gun which will "reach out" a goodly distance and hit hard, for there is little shelter to hide the approach, and the birds seem to be competent judges of distance and get up just a little out of range of an ordinary twelve gauge. At about six miles from the mouth of this creek, and almost the only available spot, is a bridge crossing the stream. On one side of the creek is the farm residence of John Dildine and on the other, built upon land leased from Dildine, the club house of the Onero Gun Club. The spot is famous hereabouts as one of the best points for shooting in this section; and at certain seasons this bridge affords fine shelter from which gunners may bang away at flock after flock of ducks leaving the creek above and flying across this point to the lake or returning from the lake for their morning meal. Both above and below the bridge the bends in the creek afford good stands from which to shoot. The sportsman can find moderate accommodations at Dildine's, though he says he "don't keep a hotel." A boat can generally be procured of him, but the surest and most satisfactory way is to provide your own outfit. All in all, that portion of Willow Creek between Dildine's and the lake may be considered the best ground for shooting—availability and everything considered.

To the north of Tusten a short distance, Norwegian Point offers attractions to the sportsman in the form of canvasbacks, which are said to congregate there late in the fall. I have never had the fortune to investigate its merits and can only speak by hearsay. It is a famous spot for summer camping parties.

The Wolf River enters Poygan about its centre on the north, and goes out at the southeast corner, when it enters the Fox River which soon swells out and becomes Lake Butte des Mortes, again assumes the proportions of a river, flows through Lake Winnebago and on to Green Bay. On the Wolf, between Lake Poygan and the Fox River, is the little village of Winneconne—a sleepy, country town, possessing, however, all the requisites for an enjoyable hunting trip—a hotel, boats, boundless marshes and plenty of game. At the mouth of the Wolf in reality, but seemingly at the mouth of the Fox—for the positions of the streams are such that the latter seems to enter into the former—and along the adjoining marshes ducks are abundant, and he who cannot get as

many as he wants is either greedy or a mighty poor shot. The good ground extends down the Fox to and including Lake Butte des Mortes.

The varieties of ducks found here include, in local parlance, mallards, redheads, blue and green wing teal, wood duck, bluebill, butter balls, Winnebago and canvas-backs. Mallards, teal and wood duck are protected by law in the spring, and it is probable the game laws will be so changed this winter as to prohibit spring shooting entirely. The law as it is receives little attention, as gunners are apt to take anything in the duck line that comes along without regard to its species.

To reach these places one may go by either the Chicago & Northwestern or Chicago, Milwaukee & St. Paul Railway to Oshkosh, whence a steamer leaves every afternoon for Tusten, arriving about six o'clock. Daily steamers also leave Oshkosh each morning for up the Wolf, touching at Winneconne, but not at Tusten. One can also go direct to Winneconne *via* the Chicago, Milwaukee & St. Paul road. Should one desire to paddle down Willow Creek he can take the same line of railroad for Berlin, and, being provided with a boat, can charter a team to take him to Auroraville—seven miles—where he may discharge his team, launch his boat and be independent. Four or five hours will bring him to Dildine's, and three more to Tusten. Here, having had his fill of hunting, he can put his boat and himself on board the O. B. Reed and, leaving at 6 A. M., be in Oshkosh about nine o'clock; or, being yet of a wandering mind, he can "paddle his own canoe" through Poygan, down the Wolf past Winneconne, through Butte des Morts and bring up at Oshkosh. One should go well provided with ammunition or supply himself at Oshkosh or Berlin as none of the other points keep a supply for breech-loaders.

Though wild geese are seen in plenty in their spring and fall migrations, comparatively few are taken at any of these places. There are, however, in Waushara County to the west of Lake Poygan, a number of small lakes which are favorite resting-places for geese and brant, and some seasons fine sport may be had among the cornfields near the lakes.

Both the Wolf and Fox Rivers afford many attractions in scenery, game and fish to the canoeist of which we expect to see them take advantage in the near future. BADGER.

Waushara County, Wis.

FOUL FANCIES.

CLUMBERS VS. COCHINS.

I HAD a neighbor years ago,
A jovial fellow he;
His countenance shone out with mirth,
A pleasant sight to see.

We lived in friendship, side by side,
Nor thought of coming strife;
But soon, alas! a cloud arose
Which marred our peaceful life.

My neighbor fancied fancy fowls;
They flocked around his door;
Of Brahmas, Cochins, all the best,
He had full many a score.

And I possessed two pairs of dogs,
Of breed unblemished they;
I loved to go into the yard
And watch their graceful play.

Oh, idleness will mischief breed
In dogs as well as men!
The eldest dog one summer's day
Proposed to eat a hen.

And from that date until to-day,
With many fearful howls,
These wretched dogs on murder bent
Keep foully eating fowls.

My neighbor wrote me sundry notes,
Which grieved me to the core;
In gentle tones I answered him,
Then walked about and swore.

Two dogs are tied in iron chains
And two are far away,
In regions where no hens exist
Those banished felons stray.

But still a cloud is on my brain,
A sorrow in my mind;
I miss my neighbor's cheerful bow;
To me he's grown quite blind.

And in the night I toss about,
Wild dreams disturb my rest;
A Bramah's pecking at my eye,
A Cochin's on my chest.

And to the neighbors I would say,
Keep up your fences all;
Don't leave one single little gap
Through which a dog may crawl.

"Familiarity contempt will breed."
From this flows worse, and then
The dog bred up to capture birds
May perchance kill the hen.

And so this wicked game goes on,
With naught to check or clog,
For well the sporting world doth know
No hen will eat a dog.

To love your neighbor as yourself
Is precept good and true;
But with those hens and with those dogs
How hard it is to do.

Dear friends, this story's moral
Is scarcely clear to me;
I never had *foui fancies*,
And I love the dogs, you see.

But if this feud should prosper
May the Court defend the right,
And the jury find a verdict
That the plaintiff's "cock won't fight."

RIDEAU.

WORTH REMEMBERING.—Probably every reader of FOREST AND STREAM has experienced serious inconvenience and pain from what is commonly called sun or snow blindness. Many times when hunting in the winter season my eyes have become so painful and my sight so badly blurred by the reflection of the sunshine from the snow that I could see game but a short distance away, and even when I did see it could do no satisfactory work with my rifle. A short time ago I discovered, sitting on its haunches, its back turned toward me, and utterly unconscious of my presence, a huge wildcat; but I was so badly "snow blinded" that though I could see the cat I could not see the sights upon my rifle, and consequently failed to kill the beast. Often, too, when shooting from a boat on the water, or shooting from the shore out over the water, I have experienced the same difficulty of vision if the sun was shining brightly.

Once last winter I spent several hours fishing through the ice; the sun shone brilliantly; the ice was a perfect "glare," and the result was that I came home with my eyes so badly inflamed that for several days I was in sore distress, and feared that the injury was permanent. I have tried several remedies for this evil, and find that the following is by far the most efficacious, and right willingly do I give it to my brethren of the FOREST AND STREAM.

Take a piece of burnt cork, or if that is not conveniently at hand take a "smut coal" and thoroughly black the skin around the eyes, and also the top and sides of the nose. Try this, and you will not only find it to be an excellent remedy for what you have often found to be a great annoyance, but feel inclined to thank me. J. FRANK LOOKE.

Burnhamville, Minn., March 4, 1881.

Natural History

PRESERVING FLUIDS FOR FISH AND FISH EGGS.

[Translated from the *Fischerei Zeitung.*]

MANY persons may wish to make a collection of fish-eggs and fish. For this purpose it is first necessary to take of each species, from time to time, some of the eggs laid by for breeding, and carefully preserve them. After the fish have come from the eggs some of them must at certain periods be again preserved, and this is to be continued until the collection represents the fish, or the different species, in as many degrees of development as possible, from the unimpregnated egg to the fish fit to be eaten.

No great skill is necessary in making such a collection; it is only necessary to have a proper liquid for preserving in order to obtain specimens really true to nature and at the same time remain beautiful preparations. This liquid must above all be antiseptic, that is, preventing corruption; it should not, however, deprive the eggs and fish of their form and color, but should let them appear in their most natural condition. Hence many experiments have been made. We will briefly revise them, and then enter especially on a later process, that of Mr. John Meyer, assistant at the Imperial Institution of fish culture at Huningen. In doing this we follow the deductions of Mr. J. Meyer himself, as he published them in his book, "The Sweet Water Fishes of Middle Europe." (Berlin 1879.)

The common article for preserving—namely, alcohol—is not very good for the said purpose, for, no matter in what relation it is applied, it always bleaches the fish, and also causes them to shrink more or less; besides, alcohol does not prevent corruption if very much diluted, or if it is not in the beginning several times renewed. At the same time it assumes in a short while a wine color, and must then, from time to time, be renewed. Fish-eggs preserved in alcohol lose at once their transparency, shrink, and hence are worthless, because the germ is no longer perceptible, only the more advanced degrees of development show the faint outlines of the embryo, and the black dots of the eyes are faintly discernable through the skinny shell.

Glycerine has also frequently been recommended, but used without success; for although the color remains to some extent, the fish and eggs, nevertheless, shrink so that they cannot be recognized. Glycerine, mixed in different proportions with alcohol and water, might sooner be recommended, but even the bleaching of the fish cannot be prevented, and the eggs would entirely lose their transparency. Besides those mentioned, other liquids have been recommended, but none of them could satisfy me. I have, therefore, for years endeavored to prepare a proper liquid myself; that is, one which will produce none of the said evils, but which will preserve the eggs transparent, not essentially change the color, and prevent the bleaching of the fish as much as possible. After innumerable trials I succeeded, and in the following I give the necessary directions:

First of all, the following mixtures or liquids must be at hand:

1. The English conserving liquor, which, used alone, preserves large fish splendidly, but bleaches them. This liquor consists of—

Common salt,	0 250	kilogramme
Alum,	0.120	"
Corrosive sublimate,	0.001	"
Water,	4.500	liter

The water is made to boil, the other ingredients put in, and the whole stirred until the salt has become dissolved. After it is cold the mixture is to be filtered.

2. A solution of ten parts, by weight, of salicylic acid and pure alcohol, thirty parts by weight.
3. Alcohol of 90 degrees.
4. Pure glycerine; and
5. Distilled water.

These five liquids in different mixture I use for preserving, and I proceed in the following manner: To preserve eggs I mix—

Of No. 2 take 3 parts in liquid measure.
Of No. 3 take 20 parts "
Of No. 4 take 15 parts "
Of No. 5 take 20 parts "

In this solution the eggs appear in a living state, remain transparent and keep their form. It is necessary, however, to renew the solution several times. Salicylic acid is known as a prominent antiseptic, and operates at the same time antizymic; that is, preventing fermentation. Hence eggs can be preserved for quite a time, even in a pretty watery solution, with the addition of only a few more drops of No. 2.

For preserving young fish in the period of the yelk sack and to the age of about six months the following mixture is recommended:

Of No. 1 take 20 parts, liquid measure.
Of No. 2 take 2 parts, "
Of No. 3 take 5 parts, "
Of No. 4 take 4 parts, "
Of No. 5 take 4 parts, "

For larger fish the following mixture is used with success:

Of No. 1 take 20 parts, liquid measure.
Of No. 2 take 3 parts, "
Of No. 3 take 10 parts, "
Of No. 4 take 10 parts, "

Larger fish preserve in this mixture excellently, and remain very beautiful if in a few days deep cuts are made into the belly of the fish.

All these mixtures mentioned are to be filtered before using. As already stated, the mixture is in all cases to be renewed frequently, and especially with fish; the renewal must be continued as long as the liquid becomes muddy. The old liquid can be made clear by filtering and then used again.

To take up the prepared eggs, little re-agent glasses may be used, which should be only a little wider than the eggs. Every glass should contain only a small number of the latter; in fact, no more than about five. Thereby it is possible to observe the development of the embryo distinctly, which cannot be done if many eggs are contained in a wide glass, because in that case not one of them would appear in a light fit for observation, as one darkens the other. It is sufficient for observation and instruction to collect eggs at intervals of five days, and the young fish, after their coming out, at intervals of eight days, until the disappearance of the yelk skin. This answers for salmon and trout; with fish of more rapid development the degrees are to be chosen correspondingly. Naturally these larger specimens are to be introduced into the collection. That the glasses should be labelled and provided with an inscription which tells the name, day of development, etc., need not be specially mentioned; if possible, in regard to the eggs, the temperature of the water should be marked at which the development has taken place.

ROMEO AND JULIET.

MY TWO GREY FOXES.

EGLINTON COTTAGE, Prince William, Va.

NOT long ago my husband went foxhunting and met with a den of wee little fox babies, at the most three days old. My husband must needs fetch those little waifs home cradled in his silk pocket handkerchief. This caused me utter consternation, for what could be done with such tiny little things! I happened to put them into the rocking-chair and called my Kitty, that had one little bairn of her own. Pussy looked at them in amazement, when the little things croodled against her. She behaved in such a kind manner and commenced nursing them at once, so that her own little kit divided its nourishment with its little brother and sister fox, to the astonishment of every one. So they grew and thrived in my rocking-chair, that I had no more command of as my own, at least for three months, for they all took possession—Kitty, kit and the foxes. They soon began to be very playful and cut up all kinds of little capers and began readily to answer to their names. They were so much alike that I could not distinguish one from the other except by the colored ribbons on their necks. Romeo wore scarlet, Juliet blue.

They became my little companions and friends. When I walked out they were most anxious to go along and would walk on each side of me, and never once offered to desert me. One day I went some distance to see a neighbor and the broom grass being very high crossing the field I felt very much afraid of losing them, but they stuck close to me and never attempted to desert me and run away. I met a gentleman on the road who said, "What are those animals that you have with you?" I said, "Why, do you not see that they are little gray foxes?" He would scarcely believe it, and said that he had never seen such a pretty sight before. On my return I was astonished to see as soon as I got to the corner of the fence Juliet make the near cut across the field to the house, Romeo keeping close to me all the way around the lane. At this time they were about six months old.

One morning Juliet came home with one of her hind legs broken. I took her up in my lap and splintered it and it knitted beautifully. She was perfectly quiet, and never offered to prevent me from binding up her leg, and was most grateful. At night they slept on the porch with five or six big hounds that were very fond of them—a curious sight to see pussy, the hounds and the foxes all cuddled up together at night. Then as soon as the house door was opened Romeo and Juliet would race upstairs to my room, jump on the bed and cut all kinds of flings; Romeo would purr in my face and creep down into the bed and lie at my feet, but Juliet was much more shy. She would jump on the bed, run around and jump off again; Romeo would remain in bed until breakfast time. Then they would take their station, with their forepaws on my lap, waiting for any little bits that I would give to them. They would eat anything, but had a preference for eggs. If we rose from table and left eggs they were as quick as lightning, and would take the eggs in their mouths and enjoyed them. They were exactly like two cats about the house, and not any more trouble. Strange to say, they were never known to rob the henhouse or take a chicken of any kind. My husband and I became very fond of them, but they did not like strangers. They were perfectly free—never were tied or confined in any way. I had but one objection to them, that was their fox odor. One of our oldest Virginia fox-hunting friends, Major Thornton, came once to spend the night. The Major admired the foxes amazingly, but the little animals did not behave at all well to the Major, for they snapped and snarled at him in such an unbecoming manner that he became quite afraid of them and said: "Pray, Madam, do take them away." I think they must have had an instinct that the Major had brought many of their species to grief. Shortly after this, to our great sorrow, Romeo and Juliet met their fate. They were then fourteen months old, and began to wander too far from home. They were mistaken for wild foxes and hunted down. It was not discovered that they were my tame foxes until the hunters saw the ribbons upon their necks. They were killed by a strange pack of hounds. Romeo and Juliet were both affectionate and grateful little animals. I could have retained them until now by keeping them in captivity. That I would never have done, however, for I think it most cruel to confine any animal, and very selfish, too, for one's mere gratification, to punish only poor little animals. I am sure all such pets fret more than any person is aware of. This brief sketch may be a matter of contemplation to some of my fox-hunting friends, and let them remember the fox hunted to death has both affection and gratitude, and can be domesticated, as this little history of Romeo and Juliet will manifest. I doubt really if many persons ever inquire into the real nature and character of the poor hunted fox. Those little ones were companionable and affectionate, but the male the more so of the two. Myself and husband still lament the fate of our little pet foxes. E.

TILE OR FILE FISH.—In a late number you republish from the New York *Sun* the report of Prof. A. E. Verrill upon the deep sea fishing enjoyed by himself and others in their cruise in the Fish Hawk, and "the discovery was made that the tilefish is plentier than the cod, etc.;" and that "the tilefish, one of which weighed fifty pounds, is a magnificent fish, of a light yellow brown color, shaped like a sea bass, fine eating and destined to become a favorite market fish." I have searched scientific works in vain to find a description of a tilefish. Dr. R. Hamilton, in his work, "British Fishes," describes *Balistes capriscus* (European filefish) as being in length one or two feet, and named filefish, in consequence of the first dorsal spine being covered on its anterior edge with rough,

granular projections, and the term *Balistes* has reference to the bones or rays of the first dorsal fin acting in concert in considerable force, etc.; and the flesh of this fish is held in no estimation and has even been regarded as positively deleterious. The query is: "Are these the same fish under a different name?"

During the past winter a great many ling (*Lota molca*), a new fish on our coast, have been caught near Atlantic City. Being strangers to the fishermen, they called them "Newcomers." They are said to be quite equal to the cod as food.
B.

The tilefish is a new fish and, therefore, not to be found in the old books. Our correspondent is referred to "Proceedings of the United States National Museum," 1879, Vol. ii, p. 205, published under the direction of the Smithsonian Institution. For the benefit of our correspondent and others we will here give some of the facts in relation to this fish, as described in the above work under the following title: "Description of a new genus and species of fish (*Lopholatilus chamæleonticeps*) from the south coast of New England;" by G. Brown Goode and Tarleton H. Bean.

In 1879 Capt. Wm H Kirby, of Gloucester, Mass., took 500 lbs. of a remarkable new fish on a codfish trawl in lat 40 deg N, lon 70 deg. W., at a depth of 84 fathoms, 80 miles S. E of Noman's Land, the largest of which weighed 50 lbs. The species appears distinct from the described species of *Latilidæ*, of Gill. "It is related by its few rayed vertical fins and other characteristics to the genus *Latilus* as restricted by Gill, but is distinguished by the presence of a large adipose appendage upon the nape resembling the adipose fin of the *Salmonidæ*, and by a fleshy prolongation upon each side of the labial fold extending backward beyond the angle of the mouth. For this genus we propose the name of *Lopholatilus*."

In being necessary to give the fish some handy vulgar name which could be used by the fishermen, Prof. Goode took the last syllable of the generic name and christened it the "tilefish" which has been accepted. Should our correspondent wish the full description of the fish we refer him to the work above named.

The investigations of the U S Fish Commission have brought to light many new fishes, some of which are of great commercial value, and as the descriptions of these are not to be found in foreign publications we will be pleased at any time to light up such questions as may be necessary for our correspondents to understand these fishes. It was certainly very natural to think that "tilefish" might be a misprint for one of our old "filefishes" of the family *Balistidæ*.

MOOSE FIGHTING.—Bethel, Maine.—While living in the lake country in Oxford County in 1845, one of my neighbors related to me a graphic scene which occurred a few years before, when the country was new and he had to travel by a spotted line through the wilderness twenty miles to mill or store or post office.

While passing through the woods in what is now Andover, North Surplass, he came into an open space of alder ground where the alders were trampled down and broken off and rooted up for a space of nearly two acres. On examination he found it had been caused by the fighting of two large bull moose, and he soon came upon the skeletons of them with their horns so locked that it was almost impossible to separate them. Each pair had a great number of prongs, indicating their great age—as each prong is supposed to represent a year. They had become hooked together in the first of the fight and fairly tore up the forest in their struggle, and so ended their lives. This occurred in the fall of the year in the rutting season when the male moose is very savage. I have seen where a large, heavy moose chased a smaller one on to a sand beach and crushed the smaller one into the sand.—J. G. R.

WOODCHUCK OUT IN WINTER.—Barrytown, N. Y., February 19.—*Editor Forest and Stream:* While out fox hunting on the 14th inst. my friend and myself came across a coon track, as we supposed, and were delighted to think we could follow the gentleman up and get him "sure." We found the hole under a ledge of rocks, and returned to the house to obtain a man and tools for digging him out. When we came to unearth him we found our coon was a woodchuck, and a right hard tussel did my hound have to kill him. We took the woodchuck home and skinned him, and to our astonishment found him to be very fat indeed. The fat alone would fill three good sized tumblers. How he lived through the winter and was yet so fat is a mystery to me. His paunch was entirely empty. Did you ever hear of a woodchuck being out in February with a foot of snow on the ground? I certainly never did.—J. A.

A very unusual occurrence, we think.

AN ALBINO QUAIL.—Hope, Arkansas, February 21.—*Editor Forest and Stream:* I send you per mail the head and wing of a white quail, killed on the 17th inst., by Mr. C. M. Conway, of Washington, Hempstead Co., Ark. Mr. Conway states that there is another bird like this in the same covey from which this one was killed. I am extremely sorry that I could not procure the entire bird, but trust that the scant remains will serve to establish the fact that it was a white quail. Are such birds common, or is this but a *lusus naturæ?* Have any of the readers of FOREST AND STREAM ever met with the like?—B. M. C.

The specimen reached us, and is an undoubted specimen of *Ortyx virginianus*—a beautiful silvery white quail. We have never seen so complete an albino of this species.

WANTED—A BLACK BRANT.—Will you kindly request Mr. T. S. Van Dyke, of California, through your columns, to bear in mind his promise of securing for me the skin of what he supposes to be the black brant (*Branta nigricans*), one of which minus the head was some time ago sent to a cotemporary of yours? I am exceedingly curious to see this bird, and am now inclined to believe it is the black brant. Can exchange with Mr. Van Dyke for the skin of the ordinary variety, plentiful on our coast at present. Ask him what he has learned further of the bird.—HOMO.

Paralytic, nervous, tremulous old ladies are made perfectly quiet and sprightly by using Hop Bitters daily.

Game Bag and Gun.

THE WINTER AND THE BIRDS.

THE statistics printed last week have naturally attracted close attention from sportsmen, and we have received many letters thanking us for the very full reports which we gave, and complimenting us on the enterprise manifested in so thoroughly canvassing one of our sister States. We print this week a rough summary of the reports from each county together with some further reports which reached us too late for last week's issue.

SUSSEX COUNTY is the northern county of the State. On the west it is bounded by the Delaware River and is drained by the flat kill, Paulinkill, Wallkill, Pequest and other streams. The area of the county is about 600 square miles. The Blue Mountains traverse the western and the Hamburg and Wawayanda Mountains the eastern part. The surface is hilly. It abounds in fertile valleys which are still dotted with the springy swamps once the theme of Herbert's stories. Undoubtedly they were the best woodcock covers in America. Until recently a famous county for ruffed grouse, it may always have been considered an uncertain locality for quail, the crop varying according to the severity of the winter weather. A few seasons ago quail began to be plenty again, but from our reports we estimate that fully 60 per cent. of the game had perished.

PASSAIC COUNTY covers an area of 220 square miles; it is watered by the Ringwood, Ramapo and Passaic Rivers and the surface is very much diversified. Both grouse and quail seem to have suffered greatly, and it is safe to say that 50 per cent. have been destroyed.

BERGEN COUNTY is intersected by the Ramapo, Hackensack and Saddle Rivers; it has an uneven and part mountainous surface, a productive soil and covers an area of 350 square miles. Game at all times is very scarce in this county owing to its close proximity to New York and other large cities. There are certain sections, however, well adapted for its preservation. The reports of our correspondents vary considerably, but it is fair to say that from various causes the percentage of loss has been very large.

WARREN COUNTY has the Delaware River for its Western boundary; it is intersected by the Paulinkill and Pequest streams. The surface is partly mountainous. Through it runs the Pequest Swamp, once the harbor of all kinds of game. The land is fertile and the table land and valleys well cultivated; area 550 square miles. The destruction of game in this county has been very great, from 50 to 75 per cent. having perished.

MORRIS COUNTY is partly bounded by Pequonnock and Passaic rivers, and is drained by the Rockaway and Whippany rivers; the area is 650 square miles. The county is traversed by ranges of hills, some of which, as Scooley's mountains, reach a considerable height. The southern part of the county is covered with vast tracts of low meadow lands and swamps which in years past were the paradise of snipe shooters. The reports from this county have been very full, no less than fifty correspondents having expressed their views. A careful recapitulation of the letters received shows that 75 per cent. of the quail has been destroyed.

ESSEX COUNTY has an area of 200 square miles. The surface is generally level; it is traversed by two elevated ridges called the First and Second mountains. Much of the soil is highly fertile. There were few sections of the State better adapted by nature for the increase and preservation of game than this county, but of late years the woodlands have been cleared away to make room for that mushroom growth called the suburban villa, and the haunts of the game have been broken up. Of what game was left at the beginning of the close season the loss has been very heavy.

HUDSON COUNTY lies along the Hudson River facing New York city. There is little or no game in the county at any time; its area is seventy-five square miles.

HUNTERDON COUNTY is drained by the branches of the Raritan River. Its surface is level in the centre, but mountainous at the north and south. The hills are well timbered, and the soil of the valleys fertile. The county has an area of 480 square miles. About one-half of the game has perished.

SOMERSET COUNTY has a surface which in some parts is very hilly. Its soil is fertile, especially along the streams which water the entire county. Its area is 375 square miles. 60 per cent. of the game has perished.

UNION COUNTY is partly bounded by Newark Bay, and has a surface of 101 square miles, which is nearly level, covered in places by vast tracts of salt and wild meadows. About 60 per cent. of its game has been destroyed.

MIDDLESEX COUNTY has a soil which is in places sandy. Its surface is undulating, and covers 399 square miles; 75 per cent. of the game has been killed.

MERCER COUNTY is bounded on the west by the Delaware River. Its surface is uneven, covering an area of 260 square miles. Years ago it was a famous section for game, but of late the shooting has been but fair. One-half of the game left at the end of the season was destroyed last winter.

MONMOUTH COUNTY is drained by the Neversink, Shrewsbury, Shark and Tom's rivers. It has an area of 800 square miles, and a surface generally level, with elevations toward the northeast. This county has the reputation of being one of the best sections for game in the State. There was excellent shooting last autumn in many localities, but the past winter has depleted the stock of game from 60 to 75 per cent.

BURLINGTON COUNTY extends from the sea coast to the Delaware River. The soil is fertile near the river, but sandy in the eastern part. The surface is level, and is covered by vast forests of pines. Its area is 600 square miles. Less than a hundred years ago there was excellent prairie chicken shooting in this county, but it is entirely a thing of the past. The loss of game during last winter was very heavy; probably over 70 per cent. perished.

OCEAN COUNTY has a level surface, much covered with pine forests. The soil is light and sandy. Area, 550 square miles. About 50 per cent. of the game of this county has been exterminated.

CAMDEN COUNTY is bounded on the west by the Delaware River. The surface is generally level; the soil is sandy. Area, 220 square miles. Over one-half of the game of this county has been destroyed.

GLOUCESTER COUNTY has an area of 280 square miles. Its surface is level, covered with forests. Along the Delaware River the land is well cultivated, but the soil inland is sandy and unimproved. Sixty per cent. of the game was killed last winter.

ATLANTIC COUNTY has a surface of 620 square miles, which is low and flat. Near the coast it is marshy, but further inland the soil is light and sandy. Seventy-five per cent. of the game has perished.

SALEM COUNTY is bounded on the west by the Delaware River. It is drained by the Salem, Alloways and other creeks. The area is 540 square miles. The surface is level and the soil a fertile sandy loam. The game in this county has been practically exterminated.

CUMBERLAND COUNTY has a surface which is generally level, overgrown with pine forests. Its area is 480 square miles. The loss has been heavy, but not as much as in other counties.

CAPE MAY COUNTY, the southern county of the State, has a level surface, with a soil entirely alluvial. Numerous inlets indent the shores, and great marshes extend along its coast boundaries. The game has not suffered as much as in other counties of the State.

SUSSEX COUNTY.

Beemerville.—The quail have perished from the snow and cold weather. Nine out of ten quail are dead. The farmers and sportsmen have not fed to my knowledge.

Quarryville.—Snow and cold weather have had a bad effect on quails and partridges. A great many have been frozen to death—about 75 per cent. Some farmers feed them, but not many were saved, I am sorry to say.

Stanhope.—The winter has been very severe on quail, but owing to the fact that many farmers and other individuals have fed flocks, and that it is a thickly settled farming county, the birds have been able to get food and shelter. Stacks of hay and grain standing in the field have afforded much protection. I do not think 10 per cent. have perished.

BERGEN COUNTY.

Saddle River.—I think the winter has had little effect on the birds here. The birds are not fed here. Permit me to state a fact here, namely: That if for a couple of years a bounty should be placed upon hawks there would be fifty per cent. more birds in all sections of the land. In former years there were forests or thick shrubbery to protect the birds from the hawks. If the sporting clubs, instead of spending their money or a limited portion of it for pigeon shooting, would spend some of it in a bounty for hawks they would be doing good for themselves and others.

WARREN COUNTY.

Blairstown.—At least from 60 to 75 per cent. of the quail have perished, the snow drifts and hail storms being the cause. Generally the birds are fed.

HUNTERDON COUNTY.

Perryville.—The destruction has been somewhat greater this winter than usual. About 50 per cent. of the quail have perished. Do not think the farmers fed the birds.

SOMERSET COUNTY.

Blackwell's Mills.—The destruction of birds in this locality has been greater this year than in other years, but not to the extent that many anticipated. A mile or two back from the river many more quail have perished than near the river. Farmers and residents did, as a general thing, feed the birds.

North Branch.—The winter has been very destructive to birds in this vicinity. Very few, if any, birds are left. I cannot give the percentage. Have not heard that any farmers have fed them.

UNION COUNTY.

Plainfield.—The destruction of game birds in Union County by the cold weather the past winter has not been noticeably greater than in former years. Farmers tell me of bevies that have wintered over and been fed by them. Members of our society have also watched over them.

Plainfield.—The cold and severity of the winter caused action to be taken by the residents and farmers as to feeding the birds. The game society of this place has awakened such sympathy and care for the game that the percentage of birds that perished last winter was less than for any winter for some time.

MIDDLESEX COUNTY.

Cranbury.—The farmers never feed birds here and game is scarce here from the fact that the law is disregarded and game destroyed in and out of season.

MERCER COUNTY.

Pennington.—I knew of a number of small bunches of quail, but the snows killed most of them, and what fed in the stack yards the hawks killed. One farmer kept ten quail all winter.

MONMOUTH COUNTY.

Long Branch.—I have traveled the county through and have not seen a quail and but very few pheasants. They are nearly all dead. The farmers fed them where they had a chance, but they perished with cold.

Ocean Grove.—The destruction of birds in consequence of the severe weather, scarcity of food, greater exposure to owls and hawks while in search of food is one hundred per cent. greater than during ordinary winters. Only a few farmers took the trouble to feed.

BURLINGTON COUNTY.

Birmingham.—The farmers and citizens have fed the birds this winter to some extent; yet the loss has been, I should judge, 20 per cent. of the whole—much greater than ever before.

Mount Holly.—In my opinion fully 90 per cent. of the quail have perished this winter. A few were fed, but the hawks have had it their own way. Rabbits have done better; they can subsist on bark. Quail were plenty last fall. We need better laws for the protection of game in Jersey. [Would it not be as well at first to have those you have enforced?]

Rancocas.—Birds are very scarce here. One farmer saved five and another seven birds. I think the birds went South.

Wrightstown.—The cold has been very severe on the birds in this section. The destruction has been fully one-half greater than any winter for a number of years. Flocks of quail all frozen are frequently found. The farmers fed.

OCEAN COUNTY.

Silverton.—The destruction of game in this section during the cold was about 50 per cent. Some of the farmers feed the quail.

GLOUCESTER COUNTY.

Clayton.—The snow and cold so unusual here have destroyed nearly all the small game. An attempt was made to feed the birds, but it was not done systematically. It was all we could do to protect the people, for no one was prepared for such a winter.

Franklinville.—The quail and partridges have all been killed, for I do not hear their favorite note any more. The winter has been the hardest on game here that I know of. I cleared away the snow till it got too deep to feed.

Harrisonville.—I think the winter has destroyed one-half of the game. Very few have fed the birds or cared for them.

Newfield.—The destruction of quail and other game has been greater than for many years past. Ninety per cent. perished. The resident farmers have fed.

Newfield.—In my opinion a great many birds were frozen last winter. I have had my dogs out once since the snow left us, but did not find one bird. There were a great many birds before the snow came, but I have been told by some parties that they have seen some left, but I have seen none.

Paulsborough.—In reply, the birds have suffered and died in great numbers. The farmers have fed in many instances.

ATLANTIC COUNTY.

English Creek.—I should think perhaps that one-half of the game perished.

English Creek.—I have heard of several coveys of quail perishing. One-half must be dead.

May's Landing.—I have made a good deal of inquiry about game in this county, as I am very much interested, and I think much game has perished. The hawks have destroyed large numbers, and the shooting next fall will be very poor. Quail and rabbits have been found frozen to death. Pheasants (ruffed grouse) I think have suffered less.

SALEM COUNTY.

Daretown.—The destruction of birds in sections has been severe. Seventy-five per cent. have been destroyed by snow and cold. Some flocks were fed, and thus saved.

Salem.—Since my last report I have seen two bevies of quail. So we know a few are left.

SPRING SNIPE NOTES FROM DELAWARE.

FROM time immemorial the State of Delaware has been the resort of New York and Pennsylvania sportsmen in the early spring for the English snipe or gray snipe shooting. We have, therefore, arranged to give our readers this year the very first reports on the shooting, and take this opportunity of thanking our numerous correspondents for their kind and prompt replies to our inquiries. The subjoined notes are arranged, beginning at the south and running to the northern parts of the State:

SUSSEX COUNTY.

Laurel, March 26.—We have no snipe here. Thirty miles down the river there are some.

Rehoboth Beach, March 26.—Geese and ducks are plenty, but snipe are not on much; but suppose they will be if we have one or two days southerly wind.

Georgetown, March 28.—Snipe are on now, and the shooting is getting good at Draw Bridge and Rehoboth.

Seaford, March 30.—There are no snipe in this section.

Cold Spring, March 26.—There are no snipe in this vicinity.

Williamsville, March 26.—A few snipe have been killed.

KENT COUNTY.

Willow Grove, March 30.—There have been no snipe killed yet. The ground is in good order.

Bowers, March 26.—On March 23 Mr. C. shot eight snipe—the first we have heard of this season

Viola, March 28.—The snipe are now in this vicinity.

Little Creek Landing, March 28.—The meadows are in good order for snipe. They are scarce.

NEWCASTLE COUNTY.

Townsend, March 26.—The best snipe shooting is on the entire marshes bordering upon Delaware Bay. The spring is very late with us and the snipe have not yet made their appearance.

Middletown, March 28.—A few snipe have arrived. A few warm days will make them plentiful.

McDonough, March 29.—There are some snipe. I killed a few to-day.

St. Georges, March 26.—The snipe are here though not yet in abundance, as our late cold snap has kept them back. The Peckard, Stewart, Huslock and Hundred Acres are the favorite meadows for finding them.

St. Georges, March 26.—From 5 to 10 in an hour has been the largest bags of snipe reported yet. They have been here a few days.

Christiana, March 29.—The spring snipe have come. I shot half a dozen, but it is too cold for them to come in numbers yet.

Christiana, March 28.—I shot the first snipe of the season in this section on March 17. They are still scarce; I have been gunning them for two weeks.

Newport, March 28.—There is a scattering of snipe from the South. The 1st of April is about the time for them to be on with us.

Newark, March 28.—Some snipe are here, but about April 15 they will be plenty.

Marshallton, March 26.—Snipe may be expected daily.

Kirkwood, March 28.—Have not seen any English snipe this spring.

Mount Pleasant, March 26.—It is too soon for snipe.

Mount Pleasant, March 26.—Snipe will be on in a week or two.

Yorklyn, March 26.—No snipe as yet that I can see.

Yorklyn, March 26.—Snipe have not come yet.

Green Spring, March 29.—Snipe began to appear on the meadows ten days ago.

Rockland, March 26.—The snipe have not made their appearance yet.

Glasgow, March 28.—There has been no snipe shooting this spring. Will be in ten days.

NEW YORK—Saranac Lakes, N. Y., March 26.—Snow still very deep and ice very thick over lakes and streams. Trouting prospects never more favorable, as the game laws have been almost strictly regarded, owing to the faithfulness of the Commissioner in making the arrest at Lake Placid. During the winter Martin's Hotel has changed hands, owing to financial embarrassment. After being repainted, partly refurnished and other improvements made, it will be opened by Milo Miller in due time for spring guests and sportsmen.

At Harriettstown thirty guests, chiefly from New York and Philadelphia, have passed the winter.

Owing to the public spirit of Dr. Trudo a handsome library building has been erected, and we trust are long to boast of a good library. S. S., N.

A Pine River, Wis., correspondent writes that a neighbor of his has a mallard drake living in a stream flowing near his house. The bird is one of a pair, and was wounded when its mate was killed. Though at first very wild when approached it has now become so tame that one can approach near enough to throw it corn without frightening it away. BADGER.

A DAY WITH THE SQUIRRELS.

NORWICH, N. Y.

A FRIEND of mine who lives next door to me is the most successful squirrel shooter I ever saw. Having hunted them from his boyhood he thoroughly understands their habits, knows just where to look for them during the different fall months, and the result is when he goes after them he generally returns with a full bag.

Two years ago last October we made an arrangement to spend a day in a large piece of woodland lying some eight miles from this village. We left in the morning before daylight, and we drove up to the door of a farm-house just as the sun was gilding the tree-tops of the woods whither we were bound.

There we separated for the day, agreeing to meet at the house where we had left our horse at sundown. I make my way along the edge of the woods through a grove of second-growth pines toward a corner where are some large chestnut trees, hoping to surprise some squirrels at their breakfast. In this I am disappointed. I see no signs of their working. I go over the fence, outside of which is an old pasture, and as I look across the fields all thoughts of squirrels are for the time forgotten. Less than half a mile away lies the farm once owned by my father. There stands the old red house where I was born. How familiar are those fields, even the old rocks seem like friends. Those patches of woodland, the old orchard, and down through the little valley runs, just as it used to, the little spring brook, where I caught my first speckled trout. Can it be that the old farm is now owned by strangers, and that father, mother, sister, brother are all gone, and that nearly forty years have passed away since that old red house was my house? Yes, and I am a gray-haired man, and shall soon follow those who have passed on before me, and if tears do fill my eyes as I gaze on this scene so dear to the years gone by, still as I turn from it I feel stronger to meet life's battles and trials.

But I came for squirrels, and the morning's passing. So I turn into the old wood road that leads to a ridge near the edge of the woods where there are plenty of chestnut trees. Making my way with all possible caution I reach the little grove and stop. Yes, they are here somewhere; I hear the rustle of branches in a large chestnut near by, the leaves are so thick I cannot see the squirrel, but I know in an instant it is a gray. I think I see where he is, and I give him the right-hand barrel. He does not fall, though hard hit, but the other barrel brings him tumbling to the ground.

The noise starts up another, and with a spring he scurries up a large tree within shot, and when about half way up stops and commences barking at me. Carefully slipping in a shell I lift my gun to my face, and at its sharp crack he tumbles to the ground. Picking them up I find they are large and fat, and I consign them to the spacious pockets of my hunting coat. I follow on in the old wood road, perhaps six or eight rods (keeping near the edge of the woods, for there the chestnuts are the ripest at this time of year, and there I know I shall find them if anywhere), when about fifteen rods away, in a small chestnut just at the edge of the woods, I see two more feeding. I dare not go toward them, they will hear my steps on the leaves, and I shall lose them. A noise on a ridge above me attracts my attention. There is another running around under the trees looking for his breakfast, but he is out of shot. What shall I do? I want all of them, and I set my wits to work to see if I cannot outwit them. If I can get into the pasture perhaps those two who are feeding in the little chestnut will not hear me, and I can get within shot. But how can I get over that fence without their taking alarm? I have it. About a rod back of me is an old pole bar way, and I cautiously make my way toward it. I reach the edge of the pasture and walk cautiously toward where they are feeding. They are busy; they mean to have a full breakfast. I go perhaps two rods when one of them leaves the tree, jumps on to the fence, and comes directly toward me. I let him come within range, and with the right-hand barrel tumble him off the fence. The crack of the gun starts the other, but he does not leave the tree. He stops feeding and commences barking; as I move a few steps toward him he jumps to leave the tree, but I am too quick for him, and with my remaining barrel I drop him. Picking them up, I retrace my steps to the old wood road which leads toward where I saw the other. Reaching the spot where I last saw him, I stop and wait fifteen or twenty minutes, for I think he is somewhere near me, and if I wait he will show himself. As I take out my watch to see the time I hear a rustling in the leaves, and sure enough there he is, not five rods away. But the movement to put up my watch will send him racing up one of these large trees. But I see no other way. The movement of my hand disturbs him, and he mounts a tree and is out of sight. Quickly glancing up the tree, away toward its top I see an open space of a few feet. Perhaps he may come into view there. I throw my gun to my face, and as he comes into view, although on a run, I pull on him. He is hard hit, but has life enough to spring into a large maple, and I fear I have lost him. I make my way to the upper side of the tree and anxiously peer up into its branches. Yes, there he is, stretched out at full length on a limb close to the body. He is badly wounded, but I give him the other barrel and he falls like a clod. Then I have got them all, and now I will sit down on that old mossy log and eat my lunch.

All the morning I have heard my friend banging away, and I know he is having fine sport. I rest for an hour or more, but I see no more squirrels. Following up the old wood road to a ridge I stand and wait some minutes, when, clear out of shot, in the top of a tall chestnut, I see one feeding. Close to it is a large pine, which I conclude is his home. I make my way toward him as still as I can, but he takes alarm and starts for the pine. If he reaches that he is safe. I start on the run toward him, and before I can get nearer than nine or ten rods he makes a jump and strikes the body of the pine. At just that moment I pull on him. I know my aim was all right, but with No. 8's he is too far, and I lose him.

The afternoon is wearing away, and I retrace my steps toward where I first found them in the morning. As I near the old fence by the side of the pasture I see a splendid old fellow quietly making his way toward a large chestnut. As he comes opposite I cut loose on him, and he is mine. This he comes opposite I cut loose on him, and he is mine. This he makes six, all large and fat. By the time I can reach the makes six, all large and fat. By the time I can reach the house it will be time for us to leave for home. As I near the house I see my friend coming up the road, and in answer to my inquiry, "How many?" he answers, "Twenty-one." He is tired, and his squirrels are a load. I am beaten badly, as usual when I go with him. But I have had a most enjoyable day, and I am content. A ride of ten hours brings us home, and we unanimously voted it a most agreeable day with the squirrels, H. C. L.

The gray squirrel is more numerous in some localities than in others and also more plentiful some seasons than others, owing to the scarcity of food and the severity of winters. This can also be accounted for by their roving habits. The best months for hunting them are September, October and November, at early morning and evening—from sunrise till eight or nine o'clock and after four in the afternoon. A rifle with a small bore is better than a shot-gun, because it tears the game very little and will kill at a long range, but an amateur would probably kill more with shot than with a rifle and for all kinds of game shot is of course the best.

Squirrels are found in the neighborhood of beech, oak, chestnut or hickory trees. They are also found on the borders of corn and wheat fields, near timbered lands, where they congregate in the fall and are often killed in large numbers. They are found on the highest branches. It is a good plan to start at sunrise, approach the hunting ground cautiously, examine every tree in which a "gray" might be feeding. You can often detect their presence by the dropping of cuttings and bark from the trees or by their peculiar hop and scratch among the leaves on the ground. Walk slowly, look in every direction, keep behind the brush as much as possible and make no unusual noise. Pilot your way in this manner until you reach a central, elevated position, commanding a good view of the surroundings. Of course if you have seen any you will kill them, but do it quietly. Much care should be exercised in selecting a favorable point from which to watch, which can easily be found by looking for cuttings, broken branches, nests and scratches on the trees and fences. If these indications are observed you may be sure there are squirrels in the neighborhood, although many inexperienced sportsmen might wander about the place for days and not see one.

Having selected a favorable point for observation, conceal yourself behind some brush or other objects, and keep a sharp lookout. If you have secured your position without frightening the game, they will soon begin to show themselves. Probably one will come into full view, but out of range. Do not move, but keep an eye on it, and perhaps it will shortly come within range; if not, note its general course, and look for it a little later. If followed, the chances are that it will hide, and much time will thus be lost, while the gray will be trembling with fright but safe in the trunk of some hollow tree. Probably you will see one emerge near at hand, but from what particular point is often difficult to determine. Don't move a muscle; he will soon be in a position which prevents him from seeing you; then bring your gun to your shoulder instantly, take a steady aim, and fire. Don't leave your position, but prepare for another shot. If the gray was among the branches, it will be a satisfaction to see him roll into a ball and drop. If you have missed he will start to run the tree-tops; but just before and after springing he generally stops long enough to allow another shot to be delivered. If missed entirely, don't go tearing after him; you will frighten every squirrel in the neighborhood. It would then be necessary for you to look for another favorable position, as the shooting would probably be over at that point. If the squirrel has been killed, let it lie, and watch for another. In this manner you may be able to bag several in an hour or two from the same position, especially if the mast is plenty and a good season. Then gather up your game and seek another favorable point. When the sun is high it will be well to look over the ground carefully and along the fences and outskirts of the timber. If you know of any nut-bearing trees in open ground, examine them, as these little animals know where to find the sweetest nuts as well as you.

Trained dogs are often employed to track and tree them, when they will hide and often exercise considerable cunning in evading their pursuers. This method is often more successful than still hunting, especially if the game is scarce.

D. TAIL.

NEW JERSEY, March 23.

I was much delighted with your *clerical* correspondent in his narration how he sang "Och Hone! the Widow Machree" or some similar "roundelay," to the listening rodents in the piney woods. From *Clericus'* fondness for a "piping i' the woods" he must be a pan-theist!

But to a youth of sixteen with double-barreled muzzle-loader in hand, the sight of the upturned tail of the nimble squirrel would, in the days of my youth, rather lead to immediate slaughter, not to consequent music.

Still it is pleasant to see the healthy love your correspondent shows for animal nature and his keen enjoyment for the "aisles of the dim woods."

The Mic Mac correspondence has given us a good idea of where to go for salmon, and there is to me no summer joy like that the tired man catches in breathing the invigorating air of the Marguerite or any of the little rivers of the upper Saguenay.

I meant when I began to gossip to tell of an experience, in Indiana, in seeking the festive gray squirrel in October. It shows that little animal's extreme tenacity of life.

In a tall beach tree, flat on a limb, I caught a glimpse of gray fur and blazed away—down came the squirrel. I loaded the empty barrel, went to pick up my game, but he quietly, at a single bound, reached a hollow tree and ensconced himself there. With smoke and a ramrod screw I finally got him out, and, *exnecessitaty rei*, I banged the squirrel's head over a log and sat down on that same log neglecting to bag him while drinking in the beauty of the russet splendor all around me.

As I started to go I reached for the *functus officio* squirrel, as I supposed—as nimbly as a young gallant could caper in a lady's chamber, Bunny took to his heels and hid in the long grass by a gurgling trout brook. I hunted for half an hour before I spied the runaway and pounced on him, putting Mr. Squirrel in my side coat-pocket.

After a delightful walk, gazing as I went at the glories of a Western sunset—"the looming bastions fringed with fire"—in the fantastic splendor of the clouds, I reached my hotel. As I sat down on the rude bench on the piazza I said, "Here, Boniface, breakfast off this squirrel," and I threw the gamy little rascal on the floor. Boniface "scooped" for him. The squirrel took wings and ran—landlord in full chase—and the squirrel in the lead, dodged under the barn! That squirrel, I never saw him more!—J. M. S.

A STATEN ISLAND SNIPE—Port Richmond, March 26.—While three members of the Holliday Gun Club were out "prospecting" to-day they started a woodcock, put up and brought to bag one English snipe, the first of the season.

PATSY.

The head of the snipe accompanied the above note.

TERRIBLE SLAUGHTER OF DEER IN MICHIGAN.

SECRETARY RONEY, of the Michigan Sportsmen's Association, has recently been engaged in collecting statistics in regard to the killing of deer in that state. These statistics were presented to the State Legislature March 15, and are of startling interest. Their importance will be especially appreciated by the residents of Michigan. The following abstract gives the main points of the report:

A prominent railroad man says: After careful investigation I find there were 9,000 deer and saddles shipped over the Mackinaw division during the open season last fall. More than half of this amount was shipped out of the State to other markets. In addition to this number I saw four bales of hides, a great number of them in the red coat, that had been killed on the Au Sable River out of season by "shinning" and done by persons hunting for the hides who threw away the fore quarters, saving only the saddles by jerking. These bales contained about 400 skins. The deer that were killed at that season of the year left fawns to die of starvation.

It has got to be a common thing to have venison upon the hotel tables at Grayling and Forest during the summer months, furnished by persons who do nothing else except hunt and fish at all times of the year whenever they can find sale for their venison and grayling. A party told me that he had killed four deer one night by "shinning" on the Manistee River.

The estimate of 9,000 deer shipped on the Mackinaw division of the Michigan Central during the fall of 1880 is based upon the following statements of venison shipments from stations north of Bay City, and which, being copied from the shipping bills, are necessarily correct:

Stations.	*Pounds shipped.*
Gaylord	12,589
Otsego Lake	22,500
Forest	22,500
Grayling	15,000
Roscommon	250,000
Chency	47,000
St. Helens	12,500
Beaver Lake	127,500
Ogemaw	15,000
West Branch	187,500
Summit	150,000
Wells	25,000
Dunham and Sterling	50,000
Standish	90,000
Pinconning	12,000
Total, lbs	1,130,000

Averaging 112 pounds to a deer, which is not too small considering that a large portion were fawns and saddles, gives us in round numbers 10,000 deer shipped from the fifteen stations above with ten stations on the road yet to hear from.

As to the shipments on the Flint & Pere Marquette and the Grand River & Indiana Railroads it is perfectly safe to place the number at 5,000 from each road.

In reference to lumber camps and the shore, S. A Van Duzen, proprietor of the Fraser House, Bay City, writes me February 10, 1881: "As to the shore, Mr. ——, of Oscoda, told me to-day he consumed 125 deer at his lumber camp this winter, and that there was not less than 1,000 shipped from Oscoda by steamer."

There are in northern Michigan at least 1,000 lumber camps. Taking only 300 of these and averaging forty deer killed to supply each camp gives 12,000 killed for this purpose alone.

If 1,000 were shipped from Oscoda alone, 4,000 is certainly a moderate estimate for the entire east shore. According to the *Au Sable and Oscoda News*, there were killed in that section for "home consumption"—which means largely "for the hides,"—4,000 deer, and 2,000 shipped by rail and steamer is considered a fair estimate for the west shore.

To closely estimate the number of deer killed for their hides in the red coat is a more difficult matter; but knowing personally of 2,500 deer so killed, and in view of the secresy with which this kind of slaughter is conducted, I consider 7,000 deer a reasonable calculation for the number so killed.

The number for home consumption in the lower peninsula I have placed at 5,000, and by this term I include all deer killed by settlers for food purposes, which you will remember occurs every day in the year; also the large number taken on the trains by resident hunting parties as extra baggage but of which no record is had in most cases, the game being returned free.

The upper peninsula is allowed 7,000 as its quota, which includes all deer killed for any purpose—for the hides, home consumption, lumber camps and shipment by rail and steamer. You will please observe that no calculation has been made for the large number of suckling fawns which have of necessity starved to death during the spring and summer months when deprived of their mothers' milk by the bullet of the insatiate "hide hunter."

The grand summary of deer killed for all purposes in Michigan during the year 1880 is then as follows:

Locality.	*Number of deer killed.*
West Shore, shipped	2,000
East Shore, shipped	4,000
Oscoda County	4,000
Flint & Pere Marquette Railroad	4,000
Grand Rapids & Indiana Railroad	5,000
Home Consumption	5,000
Upper Peninsula (in part)	7,000
Killed for hides alone	7,000
Mackinaw division of the Michigan Central Railroad	10,000
Killed for lumber camps	12,000
Grand total of deer	60,000

This is about 7,500,000 pounds of venison destroyed in the single year of 1880. At this rate how long will it take to exterminate the species in Michigan? And when the present supply is gone, where can the next come from? Certainly not from the North, East or West, for that is a geographical impossibility; while from the south it cannot be expected. Unlike other States which border upon vast wildernesses, out of which a new supply comes to replenish the disappearing race, the Lower Peninsula of Michigan, when it has once permitted this noble animal to be exterminated between Lakes Michigan and Huron, has forever lost a great source of wealth and valuable food supply, which, if now wisely preserved, will last for generations.

The immense increase from 21,000 deer killed in 1878 to 60,000 killed in 1880 is due in part to the cold weather which came early and continued steadily throughout the fall, but principally to the prohibitory export laws of surrounding States, which are driving into Michigan all the professional market hunters of the country. Can a Legislature which is cognizant of these facts delay longer that very protection which is the first law of nature, as it is of States and of nations?

Of the 60,000 deer killed in Michigan in 1880, 45,000 were shipped from the State or destroyed for the hides. How long can the State stand this drain before the last relic of the whole race disappears? Just about five years; they will become scarce in twelve months more.

The remedy is plain. Declare the killing of game for other purposes than consumption as food within the State as illegal, as recommended by our "Committee on Laws for the protection of game animals of fur and feather and insectivorous birds." Then all game shipped from the State will be *prima facie* killed in violation of the law. This will save 20,000 to 28,000 deer yearly. Then declare it a misdemeanor or crime to kill deer in the red or spotted coat, or have in possession such red or spotted coat hides, and the killing for hides will almost wholly cease, and illegal killing for lumber camps will be greatly restricted, saving 12,000 to 17,000 more deer yearly and reducing the annual destruction from 60,000 to about 12,000 to 15,000.

At the highest estimate there are not more than sixty resident hunting parties in this State who hunt with dogs for pleasure. Averaging twelve deer to each party of twelve men upon each trip of two weeks, and two such hunts a year gives 1,440 deer out of the 60,000 which were killed by the tax-paying citizens of this State during 1880. The writer knows of but one party (of three men) of resident hunters for market who hunt with dogs, but there may be others. These parties are always small in numbers. Granting that there may be ten such parties in the State, and that each takes fifty deer yearly, we have 500 deer as the aggregate of the carcases killed for the market with dogs. Then we will concede that there may be forty non-resident parties who come to Michigan and hunt with dogs for pleasure and take their venison home. Allowing them the same ratio of success as the resident parties, viz.: two hunts a year of two weeks each, and twelve deer for each hunt, gives 960 deer killed with the aid of dogs and shipped out of the State, to be consumed in the families of our friends from other States, and which will be prevented by the Prohibitory Export bill, makes an aggregate of 2,000. Adding another 100 for the sake of even numbers, and 1,000 more to that, from a desire to treat this question with indisputable fairness, and what is the result? Four thousand deer killed for all purposes with the aid of dogs in Michigan during 1880, and 56,000 killed by still-hunters for all purposes during the same year. Can any sane person now ask that deer hunting be restricted solely to still-hunters by passing a law to prohibit citizens of this State the pleasure of hunting with their dogs?

THE FLIGHT OF RIFLE BALLS.

CLEVELAND, O., March 14.

MR. T. S. VAN DYKE, in his interesting article published in the FOREST AND STREAM of March 10, proposes ("just for fun") to demonstrate that a rifle ball does not begin to fall the instant it leaves the muzzle, that as regards a falling motion although driven at great velocity forward it is in a state of inertia. He appears to claim (for fun, presumably, he is full of it) that during a certain space of time unknown of that state of inertia a rifle ball will be "driven on a level line." To show how far his ball would be projected on this "level line" he sighted his rifle of a calibre of .65 "to cut at ten yards the lower edge of an inch bullseye (so as to get the line of sight, and the centre of the line of fire parallel), and could detect no drop at fifty yards. At seventy-five yards the ball was in the lower edge of a two-inch bullseye; at 100 yards at the lower edge of a four-inch bullseye."

Now, it is believed that Mr. Van Dyke's position is not tenable on philosophical grounds nor on correct practical experiment. And to convince him that Maj. Merrill is right when he declares: "It is as mathmetically certain that the rifle does not carry straight for ten yards as that it does not for 1,000 yards. Gravity is always pulling the ball down, its efforts commence at the muzzle of the gun, and no velocity of the ball can cancel it," he has only to remember that an ounce ball or any ball fired from a rifle placed say ten feet above and exactly parallel to a horizontal plane, and the same size and weight of ball dropped from the same height at the same instant the ball fired left the muzzle of the gun, both balls will strike the plane below at the same instant of time, or if he blow a ball through the gun ten to fifty feet or drop another at the same time both will strike the ground together.

Taking this for an undisputed fact, there could be no time for the ball fired to be "driven on a level line" and strike the ground at the same time the dropped ball does. Both balls must begin to fall at once, and continue to fall all the time, and exactly alike, to reach the same distance at the same instant of time. The same force of gravitation acts exactly equally on each ball no matter how great the velocity of one may be; and if one ball lost any time in traveling on a "level line," and the other kept on dropping all the time, and both at the same rate, they could not both strike the plane at the same instant.

The atmospheric retardation of lead balls and shot is said to be as the square of their diameter. The diameter of an ounce ball is .66267 of an inch; its fall in one second of time by gravitation is 15.996 feet, and if unobstructed it will fall with an increasing speed (inversely as the square of the distance) until it acquires an ultimate velocity of 207.28 feet per second, and forever after continue at that speed. As the fall increases very rapidly until the ultimate velocity is reached, the initial velocity and time of flight per second becomes very essential in arriving at the true fall of any given diameter and weight of ball and shot. It is difficult to ascertain the exact highest initial velocity that can be given to any projectile by the expansion of gunpowder. It may range from 800 to 4,000 feet per second, but in rifle and shotgun shooting from 1,000 to 2,500 will not be far out of the way.

If you could give an ounce ball (diameter .6626) an initial velocity of 4,000 feet per second it would be projected up (a little more horizontally as then there would be no gravitation to pull it back) 3959.4 feet in 9.405 seconds, while at an initial velocity of 1,000 feet per second the total distance would be 2,109 feet in 8.460 seconds, and in one-eighth of a second it would be projected 124.9 feet, and at 4,000 feet muzzle velocity 439.92 feet in one-eighth of a second; at 2,000 feet muzzle velocity 237.85 in one-eighth second. And if you give No. 6 shot (diameter .10131 of an inch) an initial or muzzle velocity of 4,000 feet per second it would be projected 800 feet in 3.754 seconds; at 3,000 feet muzzle velocity 741.20 feet in 3 738 seconds; at 2,000 feet in, velocity .658.31 feet in 3.706 seconds, and at 1,000 feet in, velocity 51.4.54 feet in 3.548 seconds. Thus it will be seen that while an ounce ball at an initial velocity of 4,000 feet per second will travel 3959.4 feet in 9.405 seconds a No. 6 shot at the same initial velocity will only travel 800 feet in 3.754 seconds.

Hence it appears that although there be a constant parabolic fall from the instant a projectile leaves the muzzle to the end of its flight there is a great difference in the trajectory of an ounce ball at 4,000 feet initial velocity and one at 1,000 feet initial velocity and a still more marked difference between the ounce ball and No. 6 shot at the same initial velocities of 4,000 and 1,000 feet per second.

Mr. Van Dyke himself explains in the last paragraph of his ingenious article the real cause of his (real or assumed) mistake as to the actual fall of any projectile from the muzzle to the target, no matter what the distance may be, by showing a difference of six inches in the fall of his .65 inch round ball shot from his ten pound rifle, at 175 yards, charged with five drams of mixed powder (always the best), and six drams of the same powder. His rifle is unquestionably a good one. Its weight allows him to load heavily and not kill at both ends, and yet acquire an extraordinary initial velocity. The great velocity and great weight of his ball and his six drams of mixed powder undoubtedly give him a remarkably flat trajectory in the first 150 to 200 yards, and this may have led him to fall into the error (if he is not in fun) of suggesting that there might possibly be a space, and, therefore, a time when a ball could be "driven on a level line." It cannot be done.

D. W. CROSS.

FLORIDA—Monticello, March 24.—The English snipe have all gone north.—W. W. T.

OUR DETROIT LETTER.

LIGHT begins to break in the sportsmen's east, and ducks are becoming plentiful hereabout. One day this week Dr. E. C. Franklin, of Michigan University (who is not only a learned and eminent and grave professor, but an enthusiastic sportsman all round), accompanied by Justice Walter Schweikert, of this city, went down to Turkey Island, in Detroit River, where they stayed two days and captured a rousing bag of ducks each. In looking around town to-day I find that redheads are selling at thirty cents and bluebills at twenty-five cents a pair. They stick close to the river, for the reason that the marshes and bays above and below Detroit River are yet unbroken ice fields. The Huron River is breaking up, however, and the note of preparation at Point Mouille is heard "like clink of armorers closing rivets up." Several enthusiasts, including M. P. Neff, of Cincinnati, are going down next week, big with hope of immortal achievements.

The bill now before the Michigan Legislature passed the Senate yesterday with the clause prohibiting night shooting stricken out. There is every reason to believe that it will have a safe and peaceful passage through the House and secure the Governor's signature.

There is a deal of indignation manifested by Detroit sportsmen at the reckless and criminal neglect of the game laws now in vogue in Michigan—at least in respect of killing deer in the northern counties. A gentleman who has been very active in the matter of game-legislation informed me yesterday that Indians and whites have gone to the extreme of killing animals with knives—like common assassins—merely to obtain the skins, leaving the slain carcasses lying on the snow. The worst instances that have been reported occurred along the extension of the Jackson, Lansing and Saginaw Railroad, north of Gaylord, and in the vicinity of Mullet Lake. As I get it, there were fifteen deer killed in one yard—not shot, but brutally butchered like hogs, and several of the does were heavy with young. The only arrest that has been made, so far as I know, was that of an Indian who was fined the ridiculously inadequate sum of $2. The only way to put a stop to this is for genuine sportsmen to organize a merciless crusade against these criminal butchers.

Detroit, March 26, 1881. VIDOCQ.

LIFE IN THE WOODS.

HYDE PARK, Feb. 23.

Editor Forest and Stream:

Capt. Barker delivered a sixth and last lecture on Friday P. M., and I had taken notes preparatory to sending the closing portion of his lecture, which was remarkably good, but as I found it reported in the Boston *Herald*, I clip it out and send it to you, as a specimen of a vivid and thrilling description of one phase of a hunter's life; and considering that it is in the language of a man who is a simple, honest hunter and who claims not to be a man of education, I think it remarkably good. He is to be with us next winter, and will then be proposed to give our boys another course of lectures, which will, in all probability, be superior to those given this winter, as he has now learned what is expected of a lecturer, and has lost that embarrassment which necessarily accompanied his first appearance before an educated audience.—E. DE. M.

The lecture, as reported, was as follows:

Imagine yourself trapping off in the woods in the month of December. There is a foot of light snow on the ground. You are just leaving camp in the morning; you have another camp twelve or fifteen miles away on the mountains; you have two lines of traps leading to this camp; one goes to the right over the hardwood mountains, where there is good ground for the sable and fishercat; the other goes to the left up a brook and around a small pond, where the otter, beaver and mink work; then up another brook valley to camp. You take your axe, rifle, bag of bait and lunch, and follow the mountain line, while your partner takes the valley line. You both expect to meet at the other camp before dark. It begins to snow by 10 o'clock, but your partner has no trouble in following the valley line. He gets to camp an hour before dark and cuts the wood for the night, gets it in, builds a fire and gets supper, expecting to hear you coming every minute, but things have gone differently with you. There is more snow on the mountain than in the valley; the traveling is hard; the traps want a good deal of setting over and fixing; a fisher has got into one of them and dragged it off a little ways, and it takes quite a while to find him. A light wind drives the fast-falling damp snow against the trunks of the trees. It sticks there, and by 2 o'clock you cannot see the "blazes" on the trees until you have brushed away the snow. You find one, and then look ahead and make up your mind to the next one is on. You brush off the snow—there is no blaze there. Then you go to a tree, a little way to the right, and brush again; no blaze there! then you go to the left and brush again; still no blaze! but you keep hunting, and, after a while, you find it. Then, perhaps, you have to go through the same manœuvre to find the next one. This all takes time, and before you are aware of it, it is growing dark. You have lost the line altogether, now; you do not know whether it is to the right or left of you; you know that you are still a long way from camp, and you don't know the course, so your compass is of little use to you. You think there is a good chance of your having to lie out, and you slip your hand into your pocket to make sure that your match-box is all right, but your match-box is not there. It has slipped out of your pocket in the berth the night before and you have never realized the importance of always being sure that you had your match-box before leaving camp in the morning. Your situation is not pleasant now; the damp snow through the day, together with the perspiration you have raised by your hard walking, has wet your clothes through and through. You stop and consider now. The wind has shifted around into the northwest and is blowing a gale. The snow comes piling down from the trees upon you. The fast-flying clouds look white and fleecy, and you occasionally see a cold looking star up through them. The mercury is liable to creep down to 25 or 20 below zero before morning. It is no use to think of lying out. It is—Get to camp or die. You are struggling on through the snow and darkness, fully conscious of your situation, when suddenly you hear the dim report of a rifle—and, boys, you have no idea how good the report of a rifle can sound, and what a change it can make in your feelings in an instant, until you hear it under some such circumstances. At first you find yourself rushing on in the direction from which the sound came trying to make yourself believe that it was not the report of a rifle that you—heard, but you hear it again. "There," you say to yourself, "that's my old partner's rifle sure, and I am all right once more." You then fire your rifle to let your partner know that he is heard, and then you pull out toward camp again, guided by the occasional report of the rifle, and when you get in sight of the camp how good the sparks look shooting out of the smoke hole! The White House at Washington never looked more pleasant to an ingoing President of the United States than the rough log camp has to the hunter after such an experience as this. The men who worked the hardest to elect a President were never thanked with more sincerity than the woodman's partner is for just going up into a knoll and firing his rifle. The finest dinner that was ever served at the Parker House, with all its roasts and wines, could not taste half as good to those that were honored with it as the hunter's supper of deer meat, spider cakes, or flapjacks and black tea, with neither milk nor sugar in it. The finest bed that was ever

made up was never appreciated more than the hunter's bough bed and smoky woolen blanket. That's the way with woods life—the harder the time the greater the pleasure after it is over with. Supposing you boys, when you are camping out in the summer, could go out any day and catch all the fish you wanted, how long would it be before you would not care a snap for fishing? If you could go out any night and shoot a deer, you would never have a touch of the buck fever. It is the uncertainty of wood life that makes men have a passion for it. It is the working for the game that makes it worth having. It is the hard times that make the genuine good ones, and the head-winds that make us appreciate the fair ones.

OUR ROCHESTER LETTER.

FOR a day or two past the sun has been shining with a little warmer beam on this part of Uncle Sam's dominion than has been the case since October, and the cheerful effect is visible not less among sportsmen than with other mortals. Sportsmen, as such, may be said to have gone into winter quarters with the first snow and remained in a state of hibernation until now. They are stirring themselves a little of late to the extent of discussing the prospects and making ready for next year.

The Monroe County Sportsmen's Club held its annual meeting on Friday and re-elected the officers of last year, viz., President, W. J. Babcock; Vice-President, Jas. H. Brown; Secretary and Treasurer, L. A. Pratt. The report of the secretary showed the club to be in a very satisfactory condition, financially and otherwise. It has eighty members in good standing, is out of debt and there is about $800 in the treasury. As the club is one of the oldest in the United States, it is also, as you see, among the most prosperous. A report was presented showing the disposition made of 188 migratory quail imported by the club last spring. Aaron Brownell stated that some of the birds that he placed on a farm in the country raised families and remained until late in the fall, becoming quite tame. I was able to say that at least one pair sent by me to the farm of a friend raised a brood of fourteen, while another pair were nesting when a mowing machine interfered with their family arrangements. I sent out only five pair.

A correspondent of one of your contemporaries reported to his paper last week that the native quail in this county had been all killed by the cold of the past winter. Now I am happy to know that he is much mistaken and that instead of the native Bob White having suffered severely this winter he fared much better than might have been expected. There are a large proportion of men in this county who shoot and the wonder is that a quail or grouse at all is left, but there are a few still and I do not find that any were winter-killed this season. There is a movement on foot to get a stock from the West or South, liberate them in the spring and shoot them in the fall, and then, if necessary, replace them with another supply from out of the State next season. At its last meeting the Monroe County Club paid $36 to a lawyer for defending Game Constable Schwartz (recently re-elected by a majority of 13,000). As the officer's services are almost wholly devoted to prosecuting violations of the fish law some of the men who fish very little and shoot very much are inclined to protest against expending money in the fishing interest exclusively and ask that the shooting members be not overlooked. The club will probably, if they ask it, put some money in to get Western quail. There is some inclination to laugh at the migratory quail experiment because it has not proved itself a complete success in one season. But, as "Rome was not built in a day," neither can we expect to see the quail as numerous in this country after liberating a few score as they were when the children of Israel had them on toast three times a day. In speaking of quail, a fact comes to mind that I have never seen in print and, taken in connection with your suggestion to import European partridges, is of interest. The European partridge, at least that breed of them found in Ireland, has a call very much resembling that of the American quail or Bob White. I never heard the partridge utter its call, but from the description of it given by my father I should think the birds would be mistaken for one another by the sound. He taught me how to make a partridge-call with which I have been able to closely imitate the Bob White, and as some of your readers may be curious to know how to construct it, here is the plan. Take a metal tube about an inch long and of the same diameter and on one end bind a piece of parchment. Run a horse-hair through the centre of the parchment or drawn head, knotting it inside the tube to prevent drawing out. Then rub the thumb and fore-finger in rosin and draw the horse-hair through them. If you draw at right intervals thus: — ——— — ———, you will produce a sound precisely like that of the Irish partridge. American boys may recognize in the Irish partridge-call the original of the American "Devil's Fiddle," an instrument of torture abhorred of all men.

By the way, if you were to invite some of your readers in Ireland to send an occasional letter from the Emerald Isle they would be read with interest by many in America and other parts of the world, for not only is there some of the best trout and salmon fishing there, but the shooting is, or was forty years ago, as good as any of us could wish. It is not as long ago as that since I was there and left before I could put any gun save a pop-gun to my shoulders. But my father tells me that gray plover and snipe fairly swarmed there in the winter, duck and brant were in clouds along the coast and on the lakes, while quail, grouse and partridges were abundant on the farm lands. I have heard similar facts from others who came from the land of the red setter and wolf dog. It is not so strange that the natives left such a land with regret. I was speaking lately to one of the lessees of a fishing preserve or privilege on the famous Caledonia or Spring Creek in this county, and on asking him what was the prospect for trout fishing this season he heaved a sigh and said the prospect was good for the tackle makers, but bad for the lovers of a full creel. They put a lot of California mountain trout in the stream and they flourish in it, but so gamy are they that the extremely fine tackle used for taking the native trout cannot hold the Californians which broke away easily last year and promise to part cables this season, as they have increased in size amazingly. ROKEBY.

NEW YORK—Chittenango, March 18.—Robins and bluebirds are thick with us now and have been for the past week. Partridges are quite plenty this spring; we thought they were killed by the cold weather, but they are all right.—S. E. S.

Cleanse and moisten the dry sticky mouth of patients, and refresh them with Hop Bitters diluted with cool water.

AN insurance company is about to be formed to insure the lives of persons sentenced to be hung. Such good care is taken of them that it will be an extra safe risk. (N. B.—No risk taken in the State of New Jersey.)

MY LAST MOOSE.

BY NED BUNTLINE.

I HAVE killed moose in New Brunswick, Canada and Maine. I cannot call to mind just now how many, but a fair lot of them. I got treed by a bull moose that I wounded at very close quarters up in Aroostook County once, and as I dropped my gun to get up the tree I had to stay in that tree a whole afternoon before the old cuss bled down to a weakness which enabled me to descend and finish the job for him.

My last moose was killed in the lower part of Lake Utowana at a place we called the "Narrows." I had been down to the Raquette on a little "tear," with some Boston boys who were camped on the island that Parson Murray afterward appropriated, and had spent a jolly day, and it was late when I made the short cut from Marion Prince into Utowana—a good deal nearer midnight than sunset.

I was alone, had my pet rifle (a double-barrelled muzzle-loader) with me—the Colt was the only breech-loader of that day, so far as I remember. Coming on the lake, it was so quiet and still, I thought I would light the jack which was always carried in a forward locker of the boat and try for a deer among the lily pads on the left shore.

So getting the jack ready, I laid in my oars, put my rifle in reach and paddled on up, sitting far enough forward to trim boat properly. It is a poor way to fire-hunt alone, but I have done it more than once—but not always successfully.

To take in a dripping paddle, lay it down without noise, take up a rifle and fire from a boat moving bow on to game close at hand is ticklish work. If you don't believe it, try it on!

I had got just abreast of a sharp point making in from the right hand side of the lake forming the "Narrows," when I heard a splash and the crunch of leaves in a cove to my left.

To turn the boat head on to the cove, give it two or three powerful lifts with the paddle, then let the latter float off in the water astern while the boat shot swiftly forward was the work of scarcely a second.

Then my hands, free from the paddle, were reached out for the rifle, for already the blaze of my reflecting jack lamp showed the lily pads before me.

An instant later I saw a huge moose and two bright eye-balls not an oar's length away, and cocking both barrels I let drive—a snap shot—quick as thought.

Jerusalem, what a plunge! The water and mud flew all over me as the boat moved on and the huge bulk made two or three staggering plunges and fell in the thick brush a rod or two in-shore.

Taking out my oars I backed out and picked up my paddle and then pulled in.

Taking my jack-lamp I went cautiously in, but there was no danger. The moose was stone dead. Both balls had gone nearly the whole length of him, as I found out when we dressed him in the morning. He was shot so fairly in the throat that no knife could have bled him better, though I did cut a gash crosswise, just to show that I understood my business.

I think Si Bennett was up at Eagle's Nest then, and if so, it was him I woke a little before day to go down with me after my game.

Moose were very rare then. I think Chauncey Hathorne killed two after that, and I saw tracks three or four times later, on the hills, when still-hunting. But I have never pulled trigger on a moose since that night. Elks, antelope and buffalo in the Far West have had many a call from me since then, but none of them are more lordly as game, or worse to tackle when half killed than an old bull moose. A few can yet be found in Maine, plenty in the northern forests of New Brunswick and Canada, but I doubt if there are twenty left in the entire State of New York, and thirty years ago they were so plenty in our North Woo ls that they were killed for their hides and tallow.

The first name given to the beautiful sheet of water which I named Eagle Lake, next below Blue Mountain Lake, was "Tallow Lake." The canoe of a drunken St. Regis Indian, which he capsized there, was full of moose tallow. The red-skin was drowned and some hunters found the tallow close in-shore and named the lake after the find.

I named the lower lake Utowana—the Indian name for bright waters—or the Lake of Sunshine. The first time I saw it, coming up from Raquette, the sun in a sheen of golden clouds threw a flood of lovely light upon it. Hence the name, now so well known.

SURROUNDING A SQUIRREL.

IT has been recently decided by a sporting authority in its "Answers to Correspondents" that a man attempting to shoot a squirrel which perpetually finds safety in dodging behind the trunk of a tree upon which it is perched does not go around the squirrel when he has gone completely around the tree.

This question being thus definitely settled it is well that all should know of the extraordinary difference between squirrels and other animals, for without a doubt a man going around a barn goes around all the horses and cattle in that barn. The same authority answers another correspondent who locates his squirrel upon the top of a stump four feet in diameter, in the centre of which he sits turning slowly so as to keep his head all the while toward the man—"No. By going around the stump he does not go around the squirrel." Probably this last questioner might have thought the tree had something to do with it, and that sawing it off might change the result. It is to be hoped that he is answered, and that now he knows that the matter turns wholly on the nature of squirrels, and not on any extraneous circumstances.

If, for instance, a man should walk entirely around a stock farm he would undoubtedly go around all the cattle on that farm, whether they were standing still or moving, had their heads toward him or their tails, and would even go entirely around the old bull, whether he was peacefully grazing or was pawing the earth and bellowing with rage. But if there were any squirrels upon the place he would only go around those who were unaware of his presence. Again, it is well to remember that a man may go entirely around that upon which a squirrel sits, and also around the squirrel's head, tail, heart, body, feet—in short, around his centre and circumference, every hair on his body and every atom of his composition, yet not go around the squirrel; that is, if the squirrel understands himself, and turns slowly in the direction of the course of the man. If, however, he should be asleep the man would get around him; and why does it not follow that if an insane or idiotic squirrel should by mistake turn around the wrong way the man would go around him twice by going around the tree once; and this being so, the faster he turned the more times would the man go around him.

This opens up a grand vista in the direction of perpetual motion, which is only the obtaining of the results beyond the legitimate effect of the power employed; and it is manifest that the man might stand altogether still and go around the tree to the right, if the squirrel would only turn once slowly to the left. Therefore a man engaging in a walking match, by simply having a trained squirrel in the centre of the race course, will be able to make a record only limited by the endurance of the squirrel. And why not machines upon the same principle in which one squirrel shall develop the practical results of many hundred horse power. Visions of aerial navigation arise as the subject is contemplated, but my only object in this article is to call the attention of all lovers of sportive science to the now established fact that the hardest thing in this world to "get around" is a wide-awake squirrel. GYROSCOPE.

NEWARK, N. J.

THE OHIO GAME LAWS—AKRON, O., March 21—*Editor Forest and Stream:* An item in one of your recent issues is proof that you know something of the afflictions which Ohio sportsmen suffer at the hands of our legislators. Yet we doubt if you know, or at least appreciate, the full breadth and depth of the idiocy which inspires them. You truly say that most of our laws on the subject were framed by men who were anxious to do something to convince their constituents that they were earning their salaries. You might have added that most of those who have tackled the game laws don't know enough to wrestle with any other subject, and concluded, as the old Dutchman did about his dog, that "he must be good for coons, 'cause there's nodings else he's good for, under de suns and moons."

It makes little difference to the Ohio sportsman who does not own the land over which he proposes to hunt whether there is any open season or any game. The trespass law, passed last winter, is all he needs to know, and if he observes that it will be very little hunting he will do. This law makes it a misdemeanor to enter upon the premises of another with gun in hand or followed by a dog, and a violation is punishable with fine or imprisonment, or both. The State already had a stringent trespass law, which fully protected every farmer's property, and meted out condign punishment to any stranger who purposely or carelessly injured it. In addition to this, if he objected to hunting on his premises all he had to do was to post a notice to that effect. These laws should have been, and in this section we know were, sufficient. The subsequent passage of the outrageous law now in force was brought about by a few men, both in and out of the Legislature, who thought to make themselves "solid" with the Grangers, or Patrons of Husbandry, which is a powerful organization in this State. They got up blank petitions for the law, and got them filled up with the names of tens of thousands of patrons by making them believe it was necessary for their protection. Many members of the Assembly eagerly embraced the opportunity to conciliate so powerful a class, and few had enough starch in their spinal columns to withstand the pressure: so the law was passed. To their credit be it said that but few farmers, even those belonging to the Grange, have shown any disposition to inforce the law against hunters who behave themselves in a becoming manner, and after time for deliberation many, possibly a majority, of those who petitioned for the law would gladly see it repealed. Yet so long as it remains every sportsman goes out with the not very comfortable feeling that he is a law-breaker.

The result is obvious. On their own premises farmers and their boys trap and shoot in or out of season. Many local sportsmen, who took the chances of being arrested as poachers, report finding numerous quail traps, and most of the birds sold in our market during the past season never came to their death by cold lead. This wholesale slaughter was not checked, for who would care to criminate himself for the sake of punishing some other offender? Sportsmen or shooting clubs have no incentive to protect game which they have no right to hunt. The same spirit is exhibited in regard to the fish in the small lakes which are more abundant in this county than else where in Ohio. Spearing, netting and fishing through the ice are indulged in by all who choose, without fear of prosecution.

If we had laws in Ohio which were reasonably effective for the preservation of game I should be, as FOREST AND STREAM expressed itself, in favor of letting them alone. Now, I feel very indifferent as to the amount of tinkering done, hoping that they may blunder into something that will be better than the present laws for the encouragement of game extermination. CORK.

SPORT IN NEW JERSEY—Englewood, March 15.—When I came here, some years ago, there were four or five quail about the country. These vulgar courtesans (see Web. Dic.) used to sit on the fences and shamelessly cry aloud for some dissolute person called "Bob White." I thought I would go in for sport. I bought a gun from dear old Tileston and a brace of dogs to match, and thus set up an establishment. I used to feed the quail all winter and all the bright summer afternoons I used to go out and watch my dogs flush the young coveys and turn tail to shot with the greatest satisfaction. I did expect great things when "the season" should open. Alas! for a week before that event I lived in an atmosphere of 4th of July. It was "pop, bang! bang, pop!" till my wife cried with nervousness and my poor setters nearly starved to death under the barn. 'Twas the pot-hunter abroad in the land. There were myriads of them. Special railway trains brought them from every direction. Whole companies of German Yaegers, with beautiful canvas garments and bright green gun-straps and dark red sausages swarmed at every station. I couldn't take a seat in a car without looking down the muzzle of a blunderbuss. On the morning of the 1st I got up early and put up three scattering quail, but I did not dare to shoot, for fear of peppering a sportsman. They were behind every tree and under every bush and lying on their stomachs in the tall grass and reposing on their knees in the swamps. Then, too, I found that the doctor was a sportsman, and the dentist was a sportsman, and the postmaster was a sportsman, so that the few poor quail that did escape the pot-hunter couldn't fly across a five-acre lot in season without being blown into tatters at once and multiplied by seven next day. Thank the Lord the winter and the hawks have killed them all off this year. I hear no reports of any coveys in this section save a few that have been fed by the railroad employes (they are all sportsmen, too), and they note the disappearance of many bunches seen along the line of the track early in the winter. I think seven-tenths of the native birds must have perished, and the occupation of the pot-hunting Othello is gone—hereabouts at least.—F. S. P.

A NOVEL PROPOSITION—March 22—*Editor Forest and Stream:* I presume that I may fairly be called a "gentleman sportsman." At all events, I have many elaborate theories concerning fire-arms and projectiles. I seldom kill any game and never sell any. Who, then, has a better right to the above flattering title? Moreover, I am morbidly conscientious about the game law and the recollection that I once shot an inadvertent prairie-chicken on the 5th of August is the bitterest memory of my life. But, Mr. Editor, these laws are rapidly putting it out of the power of members of my profession to do any hunting whatever. You would be surprised to learn how many school-teachers, college tutors and professors are in the habit of spending the month of August in the woods and amusing the deer, bear, etc., by "firing at surrounding objects." We are a harmless crowd, but now and then one of us kills something, and it would be pleasant to be able to do so legally. Soon, however, unless all signs fail, August will be everywhere a close month for deer and most other game, and then good-bye to our favorite amusement, for our vacations do not usually extend much beyond September 1.

The game laws seem intended to accomplish two principal objects—1st, to protect game during the breeding season and while the young need maternal care; 2d, to so limit the time for hunting that our forests and fields shall not be depopulated. As to the first of these objects, I have nothing to say. But it is well known that the open season for most varieties of game is not nearly as long as the time during which it may be hunted to a reasonable extent without injury to the young. Is it not possible, then, to considerably extend the general open season, but limit the time during which individuals may shoot? Make every man who wants to hunt get a license which shall cover the days or weeks which he wishes to devote to this recreation. Let these licenses be for short periods and do not issue more than one or two to one man. Such a plan is feasible and such a law could be enforced at least as easily as those at present in vogue. A small fee for the license would be in order, and it is not impossible that these fees would pay the salaries of competent detectives and prosecutors. Few laws bear equally upon all, but it seems to me that some such modification as I have suggested would preserve the game and enable many to indulge in much-needed recreation who cannot devote October to such charming pursuits. PEDAGOGUE.

SOUTH ABINGTON SPORTSMEN'S CLUB—South Abington, Mass., March 26.—The sportsmen of South Abington held a meeting this evening, the object being to unite the South Abington Sportsmen's Club and the East End Glass Ball Club under one organization, the new association to be known as the South Abington Sportsmen's Club. The meeting proved successful and the following officers were elected to serve one year: President, W. H. Cook; Vice-Presidents, Thos. Fish and Geo. Harlow; Secretary, F. W. Bryant; Treasurer, C. F. Cook; Directors, Wm D. Lincoln, Geo. Edson, Sam'l Norton, P. Smith and Warren Edson.

A Committee on Constitution and By-Laws was appointed, consisting of Messrs. Thos. Fish, Geo. Harlow and Seth P. Gurney.

A club badge has been ordered and will be contested for in the following manner during the season: The first shoot will take place on Fast Day, the second in July and the third in October. This badge becomes the property of the member who shall win it three times in succession. It is hoped that much good may result from the union of the clubs.

The game in this section needs looking after badly—not with dog and gun, but by energetic, fearless game constables. By merciless trapping the ruffed grouse is in this vicinity about exterminated. Go where you will, the woods are filled with snares—not of recent make—but made and set years ago, for it would not pay man or boy to waste his time setting snares now. I suppose the ticks had something to do with it also.

Quail were getting quite plenty last fall, but the severe winter has probably proved too much for them. Quite a number of foxes have been killed about here the past winter and fox-hunting is a popular sport. Among the successful hunters may be mentioned Wm. Wilder, Dave Howe and Seth Gurney. The latter gentleman, I think, killed two foxes in one day. I will conclude by saying that FOREST AND STREAM is appreciated by sportsmen here, and its articles are read with interest; but I think "Uncle 'Lisha's Spring Gun" rather lays over anything I ever heard before in the gunning line. WHITE WING.

BULGING OF CHOKE-BORE GUNS.—In your issue of March 10, among your answers to correspondents, I find the following: "The 'bulging' of a choke-bore is not uncommon. It cannot be remedied. Does not hurt the gun, and will not affect the safety of the barrels." Allow me, please, to say that you are mistaken. "Bulging" can be remedied "Bulging" does hurt the gun, as far as accuracy is concerned. Try a well "bulged" gun at the target and you will find how incorrect your statement is. I have been there, and know of what I write. "Bulging" can be remedied. Last August I discovered that both barrels of my 12-gauge gun were badly "bulged," caused by shooting No. 10 wads from No. 12 brass shells. I, to o, then supposed that my gun was ruined; showed the gun to John Brewer. He told me it could be fixed and the barrels never show where the bulge had been; that there was only one gun-maker in the United States that could make a perfect job of the gun for me, and that man was Frank Kuhn, at No. 476 North Eighth street, Philadelphia, Pa. I had my doubts about it, but Brewer satisfied me when he stated that two years before he owned a fine Greener treble-wedge fast gun, No. 10 gauge, which he had badly "bulged" in both barrels by using No. 8 wads in his No. 10 brass shells. He took the gun to Mr. Kuhn, who rebored it and removed all signs of the "bulge" from both barrels. This was very cheering information, for, like you, I had supposed there was no remedy for the "bulging." I sent my gun to Mr. Kuhn; he rebored it and removed all sign of the "bulging." The barrels now are as smooth and perfect as the day they were made, and I have given it pretty hard usage during the past six months. If any one can detect the least sign of a bulge on ei her barrel I will make the gun a present to him. How Mr. Kuhn does away with the "bulging" is a secret only known to himself. I hope the information may be of value to my brother sportsmen.

Hammonton, N. J., March 14. L. W. S.

GAME IN NOVA SCOTIA.—New Glasgow, N. S., March 17, 1881.—The heavy "silver thaw" in January has done great damage among the ruffed grouse, and they will be very scarce next season. The ice remained so long on the trees that the birds were literally starved to death. Moose and cariboo have been plenty, and good sport has been had.

At the last meeting of the F. & G. P. Club it was decided to reduce the license fee for non-residents of the Province from $50 to $20. It only now requires the sanction of the Gvernor to become a law, of which I will advise you in due mo This is a step in the right direction. The law which imposed $50 as a license fee for non-residents was a most absurd one. While no true sportsman objects to contribute his share to the fund for the protection of game, it is not always convenient, if he has a friend whom he invites for a few days' shooting, to be obliged to pay $50 for the privilege; and it has been pretty well proven that it is not the sportsman who goes out for a few weeks' hunting, once or twice a year, that destroys the game. If the moose and cariboo were only subject to inroads from such as these they would soon "increase and multiply," a- the amount of legitimate hunting which would be done would not to any extent reduce their numbers.

The prospect for wild fowl shooting is very good this spring. Already the geese and brant are beginning to come, and we look forward to grand sport about the end of this month and the first part of April. GLOBE SIGHT.

PENNSYLVANIA—Rush, Pa., March 15.—The Legislature of this State has passed a bill on second reading offering a bounty of fifty cents on hawks, and a dollar on foxes and wild cats. I don't know that it has passed on third reading, but it may be confidently expected. Such a bill ought to be hailed by the farming and sporting community. There were more quail in this section last year than for the fifteen preceding years. Many were killed by hunters, and the remainder have been killed by the severe winter just past. For weeks the ground was deeply covered with snow, and the thermometer ranging from freezing point to 30 deg. below zero. Trout, too, must have suffered in the small streams on account of the low water at the opening of the winter and the great thickness of the ice.—J. W. G.

A RIFLE FOR VERMIN—Hackensack, N. J.—In killing foxes, hawks, etc., I have often wondered that sportsmen, particularly anglers, do not use a light rifle more. They would find that they could have considerable sport if on their excursions they would carry along one of Remington's .22 calibre rifles. The report is very light, and the execution up to 100 yards is most excellent. There is hardly a trip I take but I have a shot at either a hawk, cat, coon, or some such animal, and while having the fun, it also benefits the birds by killing their enemies. Around home these little rifles are more effective than a shot gun, and do not disturb our birds with a heavy report. I have fed a number of quail this winter, and hear of others having done the same. Still quite a number were found frozen.—W. HOLBERTON.

A GAME PROTECTOR'S WORK.—Herkimer Co., March 22. —*Editor Forest and Stream:* Another depredator was brought up with a short turn by State Game Agent Dodge last week in this county for killing deer. He arrested two, Geo. Wendover and Rudolph Wheeler. The jury before which they were tried found a verdict against Wendover, but let Wheeler off. However, the trial will have a good effect, for it demonstrates that the game laws are going to be enforced. And all true sportsmen will feel encouraged by the quiet and effective work of State Agent Dodge, and it is to be hoped that in the year to come he may receive more help from parties interested in the protection of fish and game.—ZACH.

THE DUCK SHOOTING.—Myriads of canvas-backs are now at Havre de Grace, but the northwest winds being so high few boxes could be put out the last two or three shooting days. Brant have arrived in earnest on the New Jersey bays. A new method of netting ducks is now being practiced at Sinnepuxent and Patomac grounds. A gill-net is set under water over the feeding grounds and the ducks, mostly blackheads, are caught by the head in the meshes in their efforts to dive through.

EXTERMINATION OF VERMIN IN GREENWOOD CEMETERY, N. Y.—The annual report announces that i is noted that chipmunks made their appearance in the cemetery during the last year for the first time. The injury done by them has been deemed a sufficient cause for their extermination, and 2,853 of them were killed. Ground mice to the number of 375, 148 cats, 40 dogs, 133 snakes, 24 moles, and 54 rats have also been killed.

GAME NOTES.—Chagrin Falls, O.—Dr. Garlick, of Bedford, O., who writes occasionally for the fish department in FOREST AND STREAM, is very feeble, and does not think he will live very long.

During the past week there has been quite a number of white swan on the river, between here and Lake Erie. Mr. Robert Graham succeeded in shooting one of them and winging another. There have also been a few geese and ducks on the river.—H.

KANSAS—Lawrence, March 4.—We are having excellent duck shooting just now. The birds are here in great variety and almost countless numbers, among them many canvas-backs. Quail seem to be quite plenty, and I think they have passed the hard winter in good shape.

THE BURY GUN.—Several correspondents write us that the gun marked "Geo. Bury" is a cheap make, W. & C. Scott's. They are for sale in Boston by Messrs. Wm. Read & Son, and are said to be serviceable arms.

MICHIGAN.—Bellevue, March 21.—Snow, snow! Slush, slush! describes the weather here. Boys have fun with coons. Saw two ducks this week. There are quite a fine lot of partridges left over, and some quail.—C. M.

NEW JERSEY—Tuckerton.—A fine buck deer was caught not very far from this place during the past winter by a "collier" back in the woods. He is now on exhibition at the house of Mr. H. E. Mulholland, and is becoming very tame.

NEW JERSEY—Pine Brook, March 26.—The snipe ground is all covered with water. There are quite a number of ducks flying.—W. J. P.

INDIANA—Worthington, March 27.—A few snipe have come, but they are very wild as yet.—S.

MISSISIPPI—Philadelphia.—We have plenty of deer, turkeys, ducks and squirrels in the woods up here now, and a few quail and snipe in the open lands, but our shooting, except for squirrels, will soon close for the season. S. P. N.

VIRGINIA—Norfolk, March 25.—Snipe are beginning to come on the marshes below here. Time to get ready for them.—J. E. M.

NEW JERSEY—Glassborough, March 15.—I have seen some few woodcock already this season.—B.

INFORMATION WANTED.

W. J. M. wants the pedigree of an Irish setter dog named Buck, brought to Norfolk, Va., by a young man named McFall, who once lived in Brooklyn, N. Y.

A CORRESPONDENT desires to obtain eggs of the sharp-tailed grouse to hatch under a bantam hen. Can any of our Iowa, Nebraska or Minnesota readers help him?

To "C. E. W."—BRAINERD, Minn.—"C. E. W.," Troy, N. Y., asks where he can find deer hunting 150 miles from St. Paul with board, etc. Tell him that if he will write to R. H. Morford, Deerwood, Crow Wing Co., Minn., he will post him and take care of him next fall; or write to C. D. C. Williams, Otter Tail, Otter Tail Co., Minn., or go to Perham, on the line of the U. P. R., and radiate in any direction. Sporting centre on line of St. P. M. & M. M. anywhere west of Sauk Rapids to St. Vincent.—T. P. C.

Sea and River Fishing.

FISH IN SEASON IN APRIL.

FRESH WATER.

Brook Trout, *Salmo fontinalis.*
Pickerel, *Esox reticulatus.*
Pike or Pickerel, *Esox lucius.*
Pike-perch (wall-eyed pike) *Stizostethium americanum, S. griseum,* etc.
Yellow Perch, *Perca fluviatilis.*
Striped Bass, *Roccus lineatus.*
White Bass, *Roccus chrysops.*
Rock Bass, *Ambloplites.* (Two species).
War-mouth, *Chænobrythus gulosus.*
Crappie, *Pomoxys nigromaculatus.*
Bachelor, *Pomoxys annularis.*
Chub, *Semotilis corporalis.*

SALT WATER.

Sea Bass, *Centropristis atrarius.*
Striped Bass, *Roccus lineatus.*
White Perch, *Morone americana.*
Pollock, *Pollachius carbonarius.*
Tautog or Blackfish, *Tautoga onitis.*

FISH AND FISHING IN THE EDISTO, SOUTH CAROLINA.

Editor Forest and Stream:

Our town, Bamberg, is situated on the S. C. R. R., two miles from Edisto River, a comparatively small stream, but one abounding in the most beautiful semi-tropical scenery in early spring that it is possible to imagine, and I have sometimes thought while waiting on some quiet and secluded island in the swamp to get a shot at some wary old gobbler that nowhere else in this green earth can equal forest beauty be found.

The gigantic moss-crowned cypresses, the spreading bench trees festooned with the trailing jessamine, and the deep sea green of the glorious magnolia at sunrise of a spring morning make up a scene I think unrivaled and worthy of the pencil of a Salvator Rosa.

But I am to talk about fishing. So come, Mr. Editor, let you and I with Donald the old veteran, get into the buggy and go down to Simm's old river to try the redbreast perch. At sunrise we arrive, and having provided ourselves with a good supply of bait—earth worms or angle worms—we unmoor Donald's boat, push off and move down the stream two hundred yards to the sand bar where the fish have come to spawn. The water is about four or five feet deep, and the bottom swept perfectly clean by the male fish which are the principal ones caught, it being very rare to catch a female while spawning, though afterward they take the hook very readily.

With a long line, a long flexible cane or rod, a small hook and plenty of bait here goes your first cast. Donald says, "Wait," and we wait, as the fish, alarmed by the disturbance in the water, have sought the cover of the bonnets; but pretty soon they come back, and you notice your float or cork moving rapidly away. Wait a moment and then pull, and for a minute or two you have as fine a contest as you could wish. You land a perch that will weigh say eight ounces, and as handsome a fellow as ever rejoiced the eye or palate of an epicure. Dark on back, dark gray on sides, sharp dorsal fins, spinous ventral and pectoral and a dark crimson breast, altogether as handsome a fish as one would wish to see. They are vigorous biters when in the notion, and when they are not you might as well roll up and go home, as no amount of coaxing will avail anything. I have often taken twenty-five or thirty in a morning using two rods and lines at the same time.

Redbreast fishing is, take it altogether, the most exhilarating sport next to partridge shooting that I know of.

We have also trout (black bass), rockfish (striped bass), besides many other kinds, and shad in early spring when the dogwood is in bloom.

The rockfish grows to quite a respectable size, twenty-eight to thirty pounds, so also the blue-cat. These heavy fish are rarely taken with rod and line as, owing to the many obstructions in the river, we cannot use the rod and fly to any advantage. We tie a very stout hook and line (short) to an overhanging limb or bush, and bait it with a large perch of some kind, and wait sometimes all night, and in nearly every instance if the hook holds we capture a large cat or rockfish.

You will say perhaps that this is not very sportsmanlike, and it isn't, yet so we catch 'em.

Another not much known method of taking fish is with a basket trap.

This trap is an oblong basket, eight feet long, made of white oak splits. One end is closed up, and the other is partly so, by the incurved horizontal splits of the framework, so arranged as to permit the fish to enter the basket through a narrow opening, but prevents their escape. This trap is baited with Indian corn ears, and sunk in some deep quiet cove and left for a week, and generally the owner finds it full of cats when he returns.

Our best fishing for trout is in the fall season, in October and November, and during these months, if the river is not too high, our best baskets are made The bait mostly used is what we call roaches, also "horneyheads" and "silvers." Having procured a sufficient number of these and having a rod of say twelve feet long and a line of eight or nine feet,

*From our correspondent's description this "redbreasted perch" is evidently one of the many fishes which are variously known as "sunfishes," "pond fishes," etc. It is probable that it may be Jordan's "bloody sun-fish, *Xenotis sanguinolentus.*"

tolerably stout, and a stout hook, we make a start. The rower sits in the stern of the boat to paddle. We bait the hook by hooking through the lips the little fishes, usually three at a time, and proceed to make a cast. Moving slowly up stream, we drop the line in every dark-looking corner, wherever water swirls around a stump, or under the bushes or canes, and pretty soon we feel a tug like some one suddenly wanting our rod. Now you must, "mind your eye," for you don't know yet whether it is a yearling three-pounder or an old mossy-back trout that has you, but pretty soon you find out; for if it is an old setter he will notify you of the fact by going straight to the bottom in spite of you, and it will only be by the very best management that he does not outgeneral you, for he knows exactly how to go down among the roots of that old cypress and tangle you so that you are glad to get off with only the loss of hook and fish. There is not much time for any fancy touches, and if you really want him you try to lead him out into deep water and swing him around to the man who is paddling, who puts his fingers into his gills and lands him in the boat.

There is no science about this, not even a landing net, but lots of good sport, and from 30 to 50 pounds of fine "trout.' This is perhaps the most exciting kind of fishing that a man can engage in—constantly on the move, constantly on the lookout for a big bite, the ever varying autumn tints of the trees, the long waving moss, the chatter of the squirrels, the "quack" of the English duck, and sometimes the sudden "quit, quit," of the wild turkey, make up as good a day's sport as any reasonable man would want. BUCKSHOT.

WILL QUINNAT SALMON TAKE THE FLY?

THIS is a question often raised, and we are permitted to publish the following private letter on the subject:

Mr. Livingston Stone—Dear Sir: In July last I was fishing for trout with a fly on the Sacramento in a pool a short distance below the bridge at Campbell's, Soda Springs Station, having on three flies—brown hackle, jungle cock and black goat. I had fished from the upper end of the pool down to a ripple at the lower end. When near the lower end of the pool a salmon of about five pounds arose to the surface and took the black goat. I played him for about twenty minutes. I had but an eight-ounce rod and single-gut leader. I brought him to a sandy beach and got him very near the shore. He was then somewhat fatigued, and I laid down the rod with the line taut, and attempted to get behind him and throw him ashore with my hands. In this I made a failure. In throwing him on shore the hook broke from his mouth and he slipped from the wet bank back into the stream and I lost him. He took the fly from the surface in the same manner as a trout takes it—that is, he arose to the surface, opened his mouth and grabbed it.

On the same trip, further down the river, at Southern's, an English gentleman; whose name I have forgotten (who is the superintendent of the Eureka Mining Company), was there fishing. He considered it unsportsmanlike to take either salmon or trout with anything but a fly, and persisted in whipping the river, although the water was somewhat roily from the mining above. The fishing was very good with bait, but I found it very poor with the fly, and I think he did also. He, however, took one salmon, weighing about ten lbs, also with a black goat, and brought it to the house. This was the day previous to my arrival at Southern's. On the day I was there he had gone with a camping party over on the McCloud. I have heard of several others, but these are the only two cases that have come within my own personal knowledge. As you are aware, salmon can be so readily taken with bait that I think they are rarely caught with the fly, except by persons fishing for trout. My opinion is that the quinnat in the Sacramento just in from the ocean will take a fly; but after being in fresh water for two or three weeks they will take nothing but the bait.

I was not fishing on the river with Sir Rose Price. He took his with bait, and it is reported also with grab hooks. I fished on the same stream with Sir John Reed, but did not see him take a salmon with a fly. B. B. REDDING.

TENNESSEE FISH NOTES.—Our anglers are already getting their tackle in order for the spring fishing. The Legislature has not yet passed the much needed protection laws, and it is questionable if they will. It is singular that in this day of enlightenment so many persons should object to laws which have become necessary and proved so efficacious in their workings elsewhere. The many streams of this State could soon be replenished with fine game fish could trappers, seiners and giggers be prevented from destroying them, as they do wholesale.....One of the most ingenious traps for catching minnows is now being offered for sale in this city. It consists of a globe made of fine wire, split in two, and joined together on the lower side by a hinge; to the rim of one of these sides is fastened a small stand for holding bait. The two halves open when set at the bottom of the creek, or can be opened and shut at will. When suspended in deep water by these strings, these are attached through a pulley to the end of a jointed rod, thus allowing the trap to be placed in the water and manipulated without the angler getting wet, as is the case with the old-fashioned minnow seine. Many of our sportsmen have seen experiments tried with it, and pronounce it the most perfect implement yet invented for the purpose. Besides, taking large fish becomes an impossibility, and doing away with the tugging about of heavy minnow buckets.....It is rumored here that our new Governor intends appointing a person to fill the position of Fish Commissioner for Middle Tennessee so long and ably, filled by Col. George F. Akers. It is to be hoped that the rumor is unfounded, since no more efficient Commissioner could be found than the Colonel, besides being a base injustice to him after doing so much as he has for the fish interest of the people. He has created a desire for protection in the minds of many, besides stimulating a taste for legitimate angling. He is known to the National Fish Commissioner, as well as to Profs. Goode, Mather, Nicholson and others, all scientific gentlemen and enthusiasts for fish culture. With proper laws, a hatchery, and the able assistance of the above-named gentlemen, the Colonel could soon stock our streams and make for himself a notoriety which, after years of stubborn opposition and difficulties, he is justly entitled to.

Nashville, March 7, 1881. J. D. H.

PROPOSED LAW IN MICHIGAN—Concord, Jackson Co., Mich., March 21.—Allow me to place before your readers the fish law which is to be passed by the Legislature of the State of Michigan. I find by glancing over the Legislative report of said State that if House bill No. 234, which has been reported on favorably for passage, becomes a law, there will be little use of any other regulations in regard to fishing in the inland waters of the State for three or four years; for the three years prohibition includes the streams of every county. Brook trout have been deposited by the Fish Commission in the tributaries of every river, and by the time the three years have expired the probability is that they will be stocked with the California trout.

The text of the bill is: Section 1. The people of the State of Michigan enact, that hereafter it shall not be lawful for any person or persons—1. To take or catch by any means whatever any fish from any stream stocked with brook trout by the Superintendent of Fisheries of the State for the period of three years after the plant of such brook trout therein; or to capture, in any manner, in any of the inland or public waters of the State, or to have in his possession brook trout, or gray ling, of a less size than six inches in length; 2. To take or catch, by any means whatever, any fish from any stream stocked with California trout by the Superintendent of Fisheries of this State for the period of four years after the plant of such California trout therein. Section 2. Any person violating any of the provisions of this act shall, on conviction thereof before any court of competent jurisdiction, be punished by a fine of not more than $100, or by imprisonment in the jail of the county wherein he shall be convicted for not exceeding three months, or by both such fine and imprisonment in the discretion of the Court. WOLVERINE.

SCARCITY OF CANADIAN SALMON.—In the article in your issue of Feb. 10, from the Albany *Journal*, on the "Unexplained Scarcity of Salmon," allow me to give my idea, and the reasons why. If, as supposed, the winter feeding grounds of the fish are on the far Labrador, Hudson Bay, or out on the North Atlantic, I believe they got caught and many of them destroyed in the immense ice fields last May on their approach to the coast. Many fish were taken in the nets with the skin, fins, tail, and even the gill covers worn and split, not bitten or torn, as I have formerly seen them. They were also in poor condition, very unlike our generally fine first-run fish, more like a mended kelt, looking just as if they had been forcing their way through thick brush. The fish belonging to our different rivers arrive at different periods. Metapedia River fish, always first, they are easily distinguished from all the others. This, formerly a well stocked river, was nearly a blank, the netters getting none, and only 30 by the rod (formerly near 300). Main River proper, Patapedia and Kedgwick fish come next. Netters term them second run. This river had about one-third the stock it has had the last five years. Its fish gave the small supply the estuary and coast netters obtained last year. In this river the parent fish are taken for the hatchery, and owing to the very low water its stock could easily be seen, particularly when in October the fish come on the shallows to spawn. On its lower waters, for the first 40 miles, fish were very scarce, and in the proportion of five males to one female. On its upper waters it had half the usual number in stock, and three females to one male. Such was the proportion taken by us, and in all my former experience males were in excess. (I may here observe more females than males take the fly.) I can form no reason for the disproportion. The Upsilquitch River fish are termed greenbacks, generally small size, coming in July, many of them escaping through the netters' 7-inch meshes. I saw many pools in this river in August with hundreds of fish in them, and notwithstanding the low water and small stream, had better rod fishing than any previous year. I think this series of facts must show that if the ice fields did not do the damage, the late run fish escaped in a great measure the general destruction. As there is in the hatchery here 750,000 salmon ova, in fine condition, to supplement the natural supply, no fears need be entertained for the future.

Metapedia, Feb 18. JOHN MOWAT, Fishery Officer.

MARINE FISHING IN CALIFORNIA.—A correspondent in California writes us that the fishing in San Francisco Bay is excellent at present, notwithstanding the floods. The Sacramento and San Joaquin rivers, which drain so large a portion of the State, are pouring immense volumes of muddy fresh water into the bay, and on the last of the ebb tide the surface water is fresh as far down as Saucelito, which is only a mile or so from the mouth of the Golden Gate. Yet the bay fishing never was better. Catches of fifty, seventy-five, and a hundred pounds of rock cod are frequent at the points off Angel Island, Goat Island and Alcatraz. All down along the Saucelito shores the rocky banks afford opportunity for rod fishing, while a little way off the boats anchor, and deep water work is done. Smelt began to run early, and are of seeming larger size than formerly. The tom cod, too, are abundant, and in good condition. Drop line angling for rock cod and perch is indulged in from the wharves at Oakland, Alameda, San Quentin and Saucelito. Sea trout, blue perch and green cod are taken from the deep water off Lime Point, at the Golden Gate. In fact the rock cod have been so numerous that there is not much genuine sport in catching them. Alcatraz Island, where there is very deep water and strong current, sea trout, blue, white and ribbed perch, and rock cod are caught in abundance. Owing to the swiftness of the current, piano wire lines are used, and leather-fingered gloves are necessary. Very heavy sinkers are of course required. Our correspondent promises us a description of the deep-water fishing at some future opportunity.

EFFECT OF MUDDY WATERS.—Dauphin Co., Pa.—Will muddy water in any stream or river, if very muddy, say for several weeks at a time, kill or suffocate black bass? The reason for asking is this: Ever since the warm weather and rains of several weeks ago, which caused a rise in the Susquehanna, and made quite a lively freshet of ice and water in the same, the water in the river has been very muddy, and within the past week large numbers of black bass have been picked up at the water's edge in a torpid or seemingly unconscious state, while many were quite dead. The different papers of Harrisburg have all contained notices of the same, and have given it as their opinion that the fish have been suffocated by the muddy water, and as all the streams emptying into the river were equally as muddy, the fish were unable to get into clear water at all. I, as well as many others interested in this matter, should be glad to hear your opinion or that of some one else on the matter, through the columns of FOREST AND STREAM.—JOHN H. ROTHROCK.

Ordinarily, fish stand freshets very well and the mud washed from the surface of the ground, but if the bottoms of the streams are stirred the gas asphyxiates them.

FIRST SALMON—St. Johns, N. B., March 26.—The first salmon of the season was caught last Tuesday morning in Port Medway River, N. S., by Mr. James Palmer. It weighed nine pounds, and was sold for $4.50.—STANSTEAD.

HE SAW NO CATFISH.—Hampton, Ill.—In answer to "How far North do Catfish Run or Live?" one correspondent says perhaps the Mississippi takes them the farthest; another has told of them in the Red River, and another of the St. Louis taking them farthest north, which is correct, I think. In 1866 I made a boat trip from St. Paul up the Mississippi to Sandy Lake, 350 miles above, and was about four weeks going up. I fished and hunted all the way, and did not see a catfish or trout. The Indians and soldiers told me that there were no catfish or trout in any of the waters that fell into the Mississippi above the falls of St. Antony. I caught plenty in St. Louis. I then portaged out of St. Louis to Pike, and down Pike to Vermillion Lake, at the time when there was such a rush there for gold and silver. In 1876 I paddled down from Sandy Lake again, but saw no catfish.—A. M. HAYWARD.

ST. LAWRENCE CHUB.—Many years ago I used to catch some fish in the River St. Lawrence, between Ogdensburgh and the Galops Rapids, which were then called "chub." My memory is not very clear regarding them, but I believe there were two kinds—one small and silvery, ranging from ½ lb. to perhaps 2 lbs. in weight, and another, less bright in hue, with reddish fins, and very much larger. They were taken with a worm, and had small mouths. It is, I am aware, rather unreasonable to ask you to name these fish for me, considering how absurdly meagre my description is; but as they are (or were) common enough in the locality indicated, some correspondent might recognize them, even from the above. Any light upon these points will be most acceptable to—X.

ILLEGAL BASS—Buffalo, N. Y., March 9.—I was very much surprised a few days ago to learn that black bass are regularly quoted in the price lists sent out by the dealers in New York, and that they are kept on sale all the while, regardless of the close season. I have cautioned a friend who is a dealer to have no transactions with black bass, as there were men appointed by the State to watch the markets and dealers as well as the fishermen, whose duty it is to prosecute all infractions of the law. He seems, like many others, to think that the game wardens don't amount to anything, and if what he says about the dealers in New York is true, it seems to me the warden for that district is not attending to his duty.—A. C. B.

VERMONT BASS—Highgate Springs, Vt.—We have some fine black bass fishing here. Two gentlemen from New York captured over two hundred with the fly one week last August. The largest catch was sixty-three in one evening, when one of them, in six successive casts, landed twelve bass.—L. L. P.

Fish Culture.

STRIPPED BASS IN LAKE ONTARIO.

WE saw the following in the Watertown *Times* of March 15:

"Clark & Robbins, the fish merchants of Sackets Harbor, had brought to their office the other day a sea bass, probably the only one ever caught in the lake or river. It was caught in Chaumont Bay and weighed six pounds. They are a very fine fish and it is thought by some that this is a forerunner and that there will be others caught."

We immediately wrote the firm named, enclosing drawings of two fishes which might be meant by the term "sea bass" and received the following reply:

SACKETS HARBOR, N. Y., March 24.

Your favor of the 21st inst. at hand with inclosure of slip from the Watertown *Times*, also drawings. The fish taken here was the lower one in drawing—*Roccus lineatus*—or striped bass of New York.

It is the first one ever seen by us taken from these waters, and we have an idea that it found its way up here by following the alewife. The specimen was very handsome and there is no doubt as to its identity. The great question here is, "What will be the ultimate result of the appearance here of the alewife?" Have they caused the extermination of the native ciscoe? Will the alewife remain with us or are they to disappear as mysteriously as they came, or will some of the food fishes of the salt water become *habitues* of our lake?

These are questions we hardly dare venture an opinion on, as we really can see no good that is to be enduring by the appearance of the alewife in our waters.

We should be glad to read your opinion on these questions, and would be pleased if the department at Washington would appoint a commission to investigate. The subject needs to be dealt with in a masterly manner. CLARK & ROBBINS.

The Ogdensburg *Journal* has an article on the alewife as follows, for we think we are correct in assuming that they refer to this fish when they speak of menhaden, which do not go into fresh waters. It says:

Considerable interest will hang upon the question, "What effect did the singular mortality noticed last year have upon the alewives or menhaden of the St. Lawrence?" The total absence from the fish markets of the old-fashioned ciscoes of Lake Ontario, reminds us that that species of fish have been supplanted by the newcomers as certainly as the aborigines have disappeared before the whites on the land. If it shall turn out that the menhaden are as numerous as ever the present season the fish commissioner should take some steps to investigate them and teach the people how to utilize their presence. If the presence of the sea bass recently caught near Sackets Harbor comes from the following of the menhaden to our waters and other species are liable to do the same thing, fishermen and fish eaters may be benefited by the facts. We suggest the superintendent of the Fishery Department send a duly qualified deputation to the St. Lawrence in June of the present year to investigate the menhaden visitation which takes place at that time.

THE GEORGIA COMMISSION.

WE have received the annual report of the Commissioner of Agriculture of the State of Georgia, who is also *ex-officio* Commissioner of Fisheries for the year 1880, together with "circular No. 14½, new series," which is a supplemental report. We learn that "Dr. H. H. Cary, of Troup County, was appointed Superintendent of Fisheries Jan. 14, 1880, and has discharged the duties of that position with energy and fidelity without salary since that time."

Dr. Cary reports that it has been a grave question how to conduct the work with the limited appropriation so as to best serve the intended purpose. He thinks that no State in the Union is so well adapted for the cultivation of anadromous fishes as Georgia. In former times the shad passed up all the rivers which empty into the Atlantic, and while none were found in those which fed the Gulf of Mexico it has been demonstrated by experiment that they will thrive in those rivers of which the State has several. The shad have been taken from the rivers at Rome and Columbus in Ga., and from numerous streams in other States which empty into the Gulf, all of which are traceable to artificial hatching. In

crossing the State in June the temperature of the rivers was 80 Fahr., and they were somewhat turbid, but the Oconee thirty years ago when teeming with shad was as muddy as at present. With an appropriation not to exceed one cent per capita the Doctor thinks that shad may be made so plentiful that a large one can be bought for ten cents.

Carp have been received from Prof. Baird, and 700 distributed, which have done well, one correspondent writing that a fish which weighed half an ounce on the 21st of Nov., 1879, now, Oct. 16, 1880, weighs four pounds, and others report a growth nearly as large. The supplemental report referred to contains an article on carp from the reports of the U. S. Fish Commission.

REPORT OF THE VERMONT COMMISSION.

THE biennial report of the Fish Commissioners of the State of Vermont for 1879-80 is quite a small pamphlet, but is instructive. Since the last report surveys have been made of many of the public waters, so as to enable the Commission to form a better judgment in the selection of the kinds of fish most suitable for them. These surveys included the area, the mean and minimum depth, the fauna and flora, the floor and the water source and supply in the lakes and ponds. These surveys have developed the fact that "most, if not indeed all, of the so-called bottomless lakes are, at their deepest part, about forty feet deep. There may be some deeper, but as yet we have not found them." Mr. Barret, of the Commission, has made a map showing the position of the public waters of the State.

Smelt have been fully established in every lake into which they have been placed and heard from, and it is a curious fact that the people have not found out that a truly excellent fish this is for the table, its insignificant size seeming to fully protect it, save from an occasional fisherman who has taken them for *bait*. This use of smelts would cause smelt-fishers to raise their eyebrows and examine the man who did such a thing in their presence; but the rural angler will get over that in time, which will educate him that the little smelt has other uses and a higher value. The report truly says of the smelt: "When they come to be established wherever there is a fit lodgment for them, that event alone will fully pay for all the expenses incurred since the formation of the Commission."

Pike-perch have received some attention, many adults which were near spawning having been placed in the streams. Land-locked salmon have been caught in some waters which were stocked, but to what extent they have thriven is not known.

Nothing has been done with salmon lately in the valley of Lake Champlain, "because all the streams appropriate for spawning roads are rendered inaccessible by dams, and in regard to the tributaries of the Connecticut, because we are waiting for the fishery interests of the State of Connecticut and its Legislature to show some sign of a sense of comity and justice to the rights of Vermont, and also for the time when salmon can ascend the fish-way at Holyoke, Mass., all of which we are disposed to regard as things indefinitely postponed." It is recommended that the fish laws and regulations shall be remitted to the towns in which the waters lie, or to some local authorities or commissioners, instead of being subject to continual change of different Legislatures.

TERRAPIN CULTURE.

In answer to inquiry we have received the following:

CEDAR POINT, Ala.

Yours of the 16th of Feb. is at hand. I have been in the terrapin business for five years, and have about two acres under a strong fence with ditches twelve feet wide and 200 feet long. Terrapin begin to lay about the 1st of May and lay seven to eight eggs at a time, they say three times during the season, and begin hatching about the last of August. The bottom for terrapin must be soft mud, and the laying ground should be sand eighteen inches deep. As soon as they hatch they should be put in separate pans where plenty of salt grass grows, as the large ones will eat the young. It takes them about five years to get large enough to ship. Salt water snakes are very bad on the young, killing many. They will stand a good deal of fresh water, but the salter the water they better.

My ditches are two to five feet deep, and a good circulation is required. The late hurricane has injured me a good deal as I am on an exposed point. It washed away my fence, and I lost a great deal of stock. They feed on fresh fish and crabs, which should be cut up and thrown in the ditch as they eat all their food in the water. I feed my terrapins once or twice a week, but the young do not seem to feed under six month or a year. I get from two to three thousand every year from the marshes. They are caught by dogs in the laying season.

I do not think the eggs can be shipped as they are packed very close in the holes they lay in. They dig holes from seven to eight inches deep and two inches in diameter, more or less.

M. DORLON.

CARP BREEDING.—For the last two years I have sent my FOREST AND STREAM to a friend in the South, and consequently not having it to refer to I am obliged to ask you for information. What I want to know is, The probabilities of the successful breeding of carp in the waters I shall describe? Pond No. 1—About ten acres, no outlet or inlet; depth of water, from one to thirty feet; muddy bottom, no sand or gravel anywhere; both yellow and white lilies grow in profusion near the shores. There were, a few years ago, pickerel, perch and pouts (bull-heads) in considerable numbers in the pond, but since the outlet was closed (which connected with the river) I think they have greatly diminished. There were plenty of what we call "shiners," and I presume there are now, provided they can breed in such a bottom.

Will carp do well in such a pond without artificial food?

Pond No. 2 contains about thirty acres; no inlet, a sluggish brook flows from it to the river (about a mile), which is a stream of about fifty yards in width, with but little current, the bottom being mud, sand and gravel in different places. The water in the pond is from six to ten feet deep in the deepest places, with mud of unfathomable depth everywhere, and well covered with lily pads. There are many pickerel, perch, shiners and bull-heads in the pond. The outlet can be easily closed with a sieve netting if necessary. Will they breed in this pond, or will they run to the river? An answer in the columns of FOREST AND STREAM will be gladly received.

FRED. A. TAFT.

[Carp prefer sluggish waters, and will be apt to remain in the pond. We incline to prefer pond No. 1, but think they may do well in both, if the cannibals are not too thick in No. 2.]

NETTING SMALL FISH.—It is a well known fact that the fish in the great lakes are neither so plentiful nor so large as they were say fifteen years ago. This is accounted for in a variety of ways—over-fishing, using nets with too small mesh which take the small fish, and as these are not valuable they are generally thrown away, thus causing waste of life and food. At different points on lakes Huron, Ontario, Erie and Michigan I have frequently gone down to see the shore fisheries where the seine is most commonly used. These nets are of different lengths and depths, but are most of them very long; the mesh is small—too small, it seems—if they may be judged by the damage they do. At each haul of the net they bring in large numbers of small fish from three to six inches long, principally herring, lake pickerel, small whitefish and trout. These being of no use are shaken out of the net and left to die on the beach, and I have seen nearly a bushel of these young fish destroyed in this way in one haul. Now this kind of thing is going on all around the lakes from the beginning to the end of the season, consequently the aggregate number of fish destroyed must be immense, while at the same time the return is extremely small in proportion to the whole number of fish destroyed; and it is only a question of time before fishing will cease to be a paying trade. Something might surely be done to prevent the waste in some way. If some of our fish commissioners would look into the matter it would perhaps pay them and give some of the fry they plant a chance to arrive at maturity.—AU SABLE.

SEQUEL TO "THE PESTIFEROUS MINK."

Scene—Troutbeck by moonlight (behind clouds).

Dramatis Personæ: Grandfather of departed mink and 10,000 young salmon in water.

Scene I.—Salmon fry sleeping. Enter grandfather of departed mink, singing: "Where, oh, where, is mine little mink gone?" Snap! The cruel steel clutches G. D. M. by tail. Uproar. Boom of cataract heard in the distance and G. D. M. is seen hastily retreating chased by trap.

Scene II.—Morning—Sylvan bank with holes. Man digging under stump for trap and G. D. M. Man digs all day. Finds G. D. M. stark and stiff, but no trap. Mystery! Boy approaches and skins G. D. M. to the tune of "Oh! dear, what can the *Mather* be."—THOS CLAPHAM.

The Kennel.

FIXTURES.

April 1, at Columbia, Tenn.—Close of entries, National American Kennel Club's second American Field Trial Derby. Joseph H. Dew, Secretary.

April 7, 8, 9, 11, 12, at San Francisco, Cal. Pacific Coast Kennel Club's Bench Show, Mechanic's Pavilion. Col. Stuart M. Taylor, Secretary, No. 313 Montgomery st., San Francisco, Cal.

April 26, 27, 28 and 29, at New York City.—Westminster Kennel Club Fifth Annual Bench Show, American Institute Building, Third avenue and Sixty-third street. Entries close April 11. Charles Lincoln, Superintendent. No. 138 Fulton street, or P. O. Box 1,709, New York City.

THE SPANIEL.

[Reprinted from advance sheets of Vero Shaw's "Book of the Dog," by subscription to the FOREST AND STREAM by the author, through the courtesy of Cassell, Petter, Galpin & Co., publishers, No. 596 Broadway, New York.]

THE antiquity of the spaniel is an undisputed fact among sportsmen, for references to same varieties of this breed have been made in every work on canine subjects from the time of Edmund De Langley, in the "Maister of Game," down to the present day. This writer states most positively that the spaniel came from Spain, and gives a description of the dog's appearance and the uses to which he was put by sportsmen of his day. Dr. Caius, in the reign of Queen Elizabeth, draws attention to the spaniel in the following words:

"*Such dogges as serue for fowling*, I thinke conuenient and requisite to place in this second section of this treatise. These are also to be reckoned and accounted in the number of the dogges which come of a gentle kind, and of those which serue for fowling.

There be two sortes— { The first findeth game on the land. / The other findeth game on the water.

"Such as delight on the land, play their partes, eyther by swiftnesse of foote, or by often questing, to search out and to spying the byrde for further hope of aduantage, or else by some secrete signe and priuy token bewray the place where they fall.

The first kind of { The Hauke, / such serue
The seconde, { The net, or traine.

"The first kinde haue no peculier names assigned vnto them, saue onely that they be denominated after the byrde which by naturall appointment he is allotted to take, for the which consideration

Some be called { (For the Falcon) / Dogges, (The Pheasant) / (The Partridge) } and such like,

"The common sort of people call them by one generall word, namely spaniells. As though these kinde of Dogges came originally and first of all out of Spaine. The most part of their skynnes are white, and if they be marcked with any spottes, they are commonly red, and somewhat great therewithall, the heares not growing in such thicknesse but that the mixture of them maye easely be perceaued. Obserued of them be reddishe and blackishe, but of that sorte there be but a very few. There is also at this day among vs a newe kinde of dogge brought out of Fraunce (for we Englishe men are maruaious greedy gaping gluttons after nouelties, and conetous corroraunles of things that be seldom, rare, straunge and hard to get). And they bee speckled all ouer with white and black, which mingled colours incline to a marble blewe, which bewtifyeth their skinnes and afordeth a seemly show of comlynesse. These are called French dogges as is aboue declared already."

A peculiar feature in the remarks of Dr. Caius is that he appears to be in doubt whether or no there was more than one breed of spaniels in the country. From the manner in which he speaks of "othersome of them" that were "reddishe and blackishe" it might be concluded that he was of the opinion that these were distinct varieties in themselves, but did not like to say so positively; though he had no hesitation in stating that a new variety was imported from France. While alluding to the work which Dr. Caius wrote, we may add that he, in another portion of that work, describes the water spaniel as another breed; but this will be remarked upon in the chapter on the water spaniels, later on. The only classification which, it appears, was made between land spaniels in the days of Dr. Caius was regulated by the work they were called upon to carry out, and the idea was prevalent for a considerable period that this was the only desirable method of distinguishing the classes from each other.

In "Iconos Animalum" there are two illustrations of spaniels given, one of the water spaniel, and the other of some small-sized dogs, not much bigger apparently than the modern toy spaniel, but displaying a distinct difference of type, as one is long-faced and the other decidedly short in muzzle. The latter illustration has been given in the chapter on toy spaniels, and the other will be found under water spaniels, later on.

Nicholas Cox, writing in the "Gentleman's Recreation," in 1697, alludes to the value of the spaniel as a sporting dog in the following words:

"How necessary a thing a spaniel is to falconry, and for those that delight in that noble recreation, keeping hawks for their pastime and pleasure, I think nobody need question, as well as to spring and retrieve a fowl being flown to the mark, and also divers other ways to help and assist falcons and goshawks. . . . It is necessary for several reasons to cut off the tip of a spaniel's stern when it is a whelp. First, by doing so worms are prevented from breeding there; in the next place, if it be not cut he will be the less forward in pressing hastily into the covert after his game; besides this benefit, the dog appears more beautiful."

The custom of docking spaniels' tails has been kept up until the present day, and in spite of the ill-advised proceedings that have been taken against persons detected in the act of removing dogs' tails, it appears likely to be continued. We cannot altogether agree with Nicholas Cox in his opinion that the beauty of a dog is improved by the removal of his tail, though we freely admit that, when a usage is established by custom, any new departure from it has the temporary effect of making the animal appear singular and possibly clumsy. Still, his remarks upon the benefit which this custom confers, in the comfort of a dog who has to work in brushwood, are recognized as perfectly correct by a vast majority of modern sportsmen. The same writer mentions that the land spaniel can be trained as a setting-dog, and doubtless in his time the setter was to all intents a spaniel, as we have before attempted to prove in the setter chapter. Nicholas Cox describes the land spaniel as "being of a good and nimble size, rather small than gross, and of a courageous mettle, . . . lusty and nimble rangers, of active foot, wanton tails, and busie nostrils. Whose tail was without weariness, their search without changeableness, and whom no delight did transport beyond fear or obedience."

This high character given to the spaniel appears to have been fully indorsed by other writers, all of whom are unanimous in declaring him to be the most useful dog to sport-men. It must, not, however, be imagined that dogs were used in the field to anything like the extent that they came to be subsequently. Netting was the great means by which game was secured in the days Nicholas Cox wrote his work the "Gentleman's Recreation," and the major portion of it was taken up with hunting, fishing and snaring of the different varieties of birds. He, however, seems to have laid himself out to give directions upon the breaking and working of several breeds of dog, and, as will be seen in a subsequent chapter, devoted considerable space to the working of what he termed the water-dog.

Sydenham Edwards, writing in 1801, in "Cynographia Britannica," gives an excellent description of the spaniel, as well as a colored plate containing four dogs. One of these is liver-and-white, another black-and-white, a third orange-and-white, and the last a sort of sandy liver. The only one that is standing up is the liver-and-white; it is represented as a long-bodied dog, with legs rather light in bone, and wide skull and hairy ears lying flat to the head. The tail is docked and is well feathered, but the feather on the legs is not very extensive, though the thighs are heavily breeched. The coat in two out of the four specimens is curly, but the dog referred to above is flat-coated except upon his back, chest and loins, where there is a decided ripple. The whole-colored dog is smooth-headed but very curly behind. In his remarks upon this breed Mr. Edwards states:

"This was usually distinguished by the name of land spaniel, in contradistinction to water spaniel, and may be divided into two kinds, the springing, hawking spaniel, or starter, and the cocker, or cocking spaniel. The first was used for springing the game when falconry was among the prevalent sports of this island, and as it made one of the principal pursuits of our British ancestors, the chieftains maintained a considerable number of birds for the purpose. The discovery of the gun superseding the use of the falcon, the powers of the dog were directed to the new acquisition, but his fleetness, wildness and courage in quest of game rendering him difficult to manage, a more useful kind was established, with shorter limbs and less speed. Yet some of the true springers still remain about London, but are rarely found in any other part of the country. These are little different from the larger spaniel or setter, except in size; generally of a red or red-and-white color; curly-formed ears, rather short; long-limbed; the coat wavy and silky; the tail somewhat bushy and seldom cut.

"Differing from this is the cocker, esteemed for his compact form, having the head round, nose short, ears long, and the larger the more admired, limbs short and strong, the coat more inclined to curl than the springer's, and longer, particularly on the tail, which is commonly truncated. Color—liver-and-white, red, red-and-white, black-and-white, all liver color and sometimes black with tanned legs and muzzle. . . . The term cocker is taken from the woodcock, which they are taught to hunt. . . .

"Spaniels are used as finders, or starters to the greyhound, and pursue the hare with the same impetuosity as they do birds. Their beautiful coats, their faithful dispositions, humble and insinuating manners, suavity and obedience even to servility, procure them universal favor; but the gunner loves them for their intrinsic merit, bestows great pains on breaking them to the gun, and when properly broke or educated is amply repaid for their services, being indefatigable in their exertions, beating the coverts, brakes and ditches in pursuit of game; their tails carried downward, perpetually moving from side to side, and this motion, called feathering, becomes more rapid when they have caught the scent, eagerly following with frequent whimpers till it is disturbed, of which they give notice by repeated quests; nor should they open at any other time. Some sportsmen disapprove of their questing at all, as it spreads the alarm too far, therefore teach them to beat mute. As it is the nature of these dogs to put up all the game they find, good sportsmen are careful to keep them within gun-shot even if in cover, and if it is extensive, jingles or bells are put upon their collars, and the dog-call used if they beat too wide."

From these remarks it appears that the uses of the spaniel in 1800 were very similar to those to which they are put in the present day; and a distinct advance has been made in the century which had elapsed since the time when Nicholas Cox delivered his remarks upon the breed. Nowadays they are not used as finders for greyhounds, but in many other respects there is little change in their mode of hunting.

W. Taplin, writing in the "Sportsman's Cabinet" in 1803, says:

"The large springing spaniel and diminutive cocker, although they vary much, differ but little in their qualifications, except that the former does not equal the latter in rapidity of action; nor do they seem to catch the scent so suddenly, or to enjoy it with the same ecstatic enthusiasm when found. . . . From the time they are thrown off in the field, as a proof of the pleasure they feel in being employed, the tail is in perpetual motion (which is termed feathering), upon the increasing vibration of which the experienced sportsman well knows when he is getting nearer the object of attraction. . . . However spaniels may be occasionally engaged in other sports, they are, in general, considered much more applicable to shooting in covert than to those pursuits in which the pointer or setter are more properly engaged. . . .

"The whole species are naturally inclined to voracity, but are capable of enduring very long abstinence, of which there are numerous well-authenticated instances upon record. The following is, perhaps, the most extraordinary fact of this description that has ever issued from the press. In 1789, when preparations were making at St. Paul's for the reception of His Majesty, a favorite spaniel bitch followed its master up the dark stairs of the dome, when of a sudden it was missed, and both calling and whistling were of no effect. Nine weeks after this, wanting only two days, some glaziers were at work in the cathedral, and distinctly heard some faint sounds among the timbers by which the dome was supported, and thinking it might be some unfortunate human being, they tied a rope round a boy and let him down near to the place from whence the noise came. At the bottom he found a dog lying on its side, the skeleton of another dog, and an old shoe half eaten." The rest of the story may be briefly told as follows: The bitch when lost was in whelp, and, no doubt, consumed her puppies when she brought them forth, and, possibly, also the remains of the other dog, who presumably had followed her into the cathedral. Her emaciated appearance, however, pointed to the extreme privations which she had undergone, a further proof of which was to be found in her weight, for when last scaled she drew twenty-pounds, but when recovered the poor beast only weighed three pounds and fourteen ounces.

In 1814 Mr. William Dobson, of Eden Hall, Cumberland, published a work on the breaking of pointers and spaniels. "Encopædia," for that is the title, however, seems to recognize the spaniel as the setter, as the former breed is not directly alluded to by the author. This would tend to prove that, subsequently to the writings of Sydenham Edwards and William Taplin, sportsmen of conservative tendencies still regarded the spaniel and the setter as practically the same breed, though on other hands, a decided difference was stated to exist between the two varieties.

In 1820 Mr. Scott produced the "Sportsman's Repository," in which he re-copied the engraving of the spaniel which appeared in William Taplin's work of 1803. This course leads us to believe that in outward appearance there had been but little alteration in the spaniel during the twenty years which had passed over the breed. The dog which is illustrated is portrayed in the act of flushing a woodcock, and is apparently of a liver-and-white color, with a long and rather lean head, and a palpable ripple in his coat. His stern, I shortened at all, has certainly had but a very small portion of it removed, and his legs, though nicely feathered, would be considered long if they belonged to a modern spaniel. From the appearance we should say it was meant to represent a dog of about twenty-five pounds in weight, or perhaps a trifle more, and the inscription beneath the illustration consists merely of the one word "Springer," no further particulars being given. John Scott does not throw very much new light upon the subject of spaniels, although he goes a little further into the description of their points than former writers appear to have thought necessary. He says:

"Spaniels are generally rough-coated or long-flued, and in all

probability such is one of their original characteristics, the smooth coats of some being the consequence of a cross in the breed. . . . . The true spaniel is distinguished by the silkiness of his flue, his pendulous and fringed ear, clear eye, moist nose and fringed tail. . . . . A cry of spaniels is not at present thought so essential as in former days; indeed, many sportsmen of the present day, whether in shooting or hunting, habitually attached to the pointer and hound, affect entirely to discard the babbling spaniel. This, however, is too strong a prejudice, as the utility of the spaniel is undoubted in thick and difficult covers, copses and runs, where neither pointer nor setter can penetrate, nor, perhaps, even the large springer, which partakes too much of their nature and size for such puzzling and thorny labors The small spaniels should yet have considerable substance and bone, and by no means be over-legged, and granting them true bred, a little harshness of the coat is no disadvantage, as such are more hardy and fearless of the thicket. The delicate and very small, or carpet spaniels, have excellent nose, and will hunt truly and pleasantly; but are neither fit for a long day or thorny covert. The grand, or questing, quality of the spaniel is well known, and his constant and bustling activity. . . . .

"The largest springers were some years since, and probably may at present be, found in Sussex. The cockers are supposed to have originated in a cross between the springer and the small water spaniel, and are distinguished from the large spaniel by a more compact, rounder and shorter head, deeper and more curly flew and larger ears. The spaniel colors are various—yellow, liver-colored, red, brown, white, black-tan with tanned legs and muzzle —these last hues denote a terrier cross. The springer is often crossed and deteriorated by the hound and pointer. . . . . Twenty years ago His Grace the Duke of Marlborough was reported to possess the smallest and best breed of cockers in Britain; they were invariably red-and-white, with very long ears, short nose and black eyes."

So much for the opinions of Mr. John Scott, who appears to have derived many of his ideas from Taplin and Edwards. The latter quotation, however, gives one piece of information which we do not find in former writers, and that is, that bone and shortness of leg were recognized as desirable points to obtain in spaniels. As John Scott attaches so much importance to these qualifications, we can quite understand the disfavor with which he regarded the hound and pointer cross, upon the undesirability of which he made some very stringent observations, which we did not consider it worth while to reproduce. As we have now come to a time when spaniels appear to have been generally recognized by sportsmen as a totally distinct variety from the setter, or rather we may more correctly put it that the setter had become recognized as a variety by itself, and some idea has in addition been laid before our readers from the writings of earlier authors, and descriptions of the illustrations which their works contained, as to what the land spaniel was like some sixty years ago, we may direct attention to a more recent date, 1845, when William Youatt wrote.

Youatt in his remarks upon dogs adopts the classification of Cuvier, and, to use his own expression, arranges the breeds "According to the development of the frontal sinus and the cerebral cavity, or, in other words, the power of scent and the degree of intelligence." Spaniels, according to this classification, come into the second division, and are in company with the setter, pointer, hound and sheep dog, whose heads should be moderately elongated, the parietal bones diverging from each other for a certain space as they rise upon the side of the head, thereby enlarging the cerebral cavity and the frontal sinus Speaking generally of the spaniel, Youatt lays down that his ears should be large and pendulous, and his coat of different lengths, according to the part of his body where it is situated, but longest on the ears, under the neck, behind the thighs and on the tail. The list of spaniels to which his book refers throws very little light upon the subject of our most modern breeds, for Youatt simply refers in general terms to the cocker and the springer and their duties. He also notices the King Charles spaniel, the Blenheim, and the Norfolk, and black-and tan spaniel. The water spaniel, however, has more space devoted to him than any of the other varieties of which he treats.

As the land spaniel exists in the year 1880 in various different forms, it will be necessary to devote a separate chapter to each variety of the breed, some of which have been in existence for many years, although they have received but scant attention from early writers. We therefore propose to proceed to the description of the various breeds of land spaniels after which the varieties of water spaniels will be treated of in a chapter by themselves.

WANTED, A WOODCHUCK DOG.

RANGELEY, Me.

I see that "Lepus," in the issue of March 24, discusses the merits of different breeds of dogs for the destruction of woodchucks. But to my mind the most killing and cheapest is that sometimes called the Oneida bulldog, otherwise the Newhouse trap. With a few of these a farm may be soon rid of the vermin and, for the benefit of the boys who may wish to engage in the sport and are unskilled in trapping, I will add a few hints. Traps of size one and a half are strong enough. Cut pegs from a forked branch eighteen or twenty inches long, one branch cut off so as to form a hook to prevent the ring from slipping off. Drive the peg firmly at one side of the burrow; level off the mound and dirt in front of the entrance Scoop out a space the size and depth of the trap. Set the trap and, to prevent its springing too easily, press a wedge of hard wood between the setting jaw and bedpiece, turning the spring at nearly right angle to the same side. Now place the trap in the cavity, the jaws parallel to the furrow and block up the loose jaw to a level with the pan, filling the space between the jaws beneath the pan with moss, grass or leaves. This to prevent the rain from washing in and packing the dirt so as to prevent the trap from springing. Lastly, cover all parts of the trap and chain a fourth of an inch deep with dirt, that over the jaws to be fine and free from gravel, as otherwise it might prevent the jaws from closing —WARFIELD.

The following remarks seem to answer the question whether the fox-terrier is game enough to kill woodchuck:

BALTIMORE, March 25.

I am quite a fancier of fox-terriers and have imported and owned a great many, and I have always found them very game ratters, and often in England I have seen a 16-pound dog draw a badger weighing nearly twice as much. Now, a badger is no easy thing for a dog to kill or draw, and a woodchuck is the nearest thing to a badger that can be had in this country. While living in Maine some time ago I imported a lemon and white fox-terrier bitch; and as she was an excellent ratter some friends wanted to see if she would kill a woodchuck. We advertised and got two. One was an old customer and had only three feet (the fourth having evidently been cut off by a trap); the other was sound and was supposed to be the uglier of the two; but such was not the case as will be seen.

We took the chucks to a room where we had previously had a box one foot square, twelve feet long, with an elbow thus: covered with glass. We put the younger one in and he at once ran to the other end and turned round. We then turned my bitch loose and she immediately went into the box and to our surprise the woodchuck stuck its head in the corner and utterly refused to show fight. The bitch pulled him out and killed him almost without resistance. Not so with the old one. He faced the bitch and fought like a Trojan for about fifteen minutes; but the bitch intrilly got him by the nose and dragged him out. We then took him away from the bitch and saved him for the time being. I guess we drew that old woodchuck ten or twelve times, when finally we let a bull-terrier draw him and he killed him (the woodchuck) before we could stop him. I went once to see a badger drawn in London. The badger was put into a box similar to the one described above and the dog was let loose; he walked leisurely in and took the badger by the nose and they walked out together as though nothing had happened. I found out afterward that the badger had been drawn so much by the dog that they had become very friendly.—HAZEL KIRKE.

PUTNAM, March 25.

In your last number, just at hand, I notice the item from "B. W." of Edgemont, Penn., saying his farm is overrun with woodchucks and wants to know how to get rid of them. Some fifteen years ago I was plagued with a lot of woodchucks that ate up my green peas, beans and squashes, and on account of the large bush thicket near the garden I could not get a shot at them, and an old hunter told me how to clean up the marauders, and, following his instructions, I went to a pond-hole and secured a speckled turtle and, tieing a string to one of his legs, then dropped a drop of spirits turpentine under his tail and putting him into the mouth of the woodchuck's hole he scrambled away down into the hole and soon the woodchuck came run-hing out as if the old Harry was after him, and we killed him. We then visited all the holes in the vicinity of my garden and secured two other woodchucks and were not further disturbed by them that summer. G. F. W.

Editor Forest and Stream:

YONKERS, March 26.

Having had a three weeks' vacation in the country last summer where woodchucks were quite numerous, I had a good opportunity to trap these animals. By actual count I trapped fifty-four and shot three with a rifle. In trapping them I employed four No. 2 Newhouse steel traps. I always set my traps at the mouth of the burrow, lightly covered with loose earth. I then secured the trap to a stake which I drove firmly into the ground, so the next time that the chuck came out of his hole to feed he was sure to be caught and held firmly till I came to release him. Woodchucks are sly creatures and hard to come at to get a shot, and even after being hard hit with a rifle bullet with oftentimes manage to escape to their holes, where the die.—M. L. A.

"Lepus" sends to you a letter from a Delaware County, Penn., farmer, in which complaint is heaped up high against Mr. Woodchuck. A canine exterminator is asked for and "Lepus" calls upon the breeders of the fox-terrier to respond through your columns. We think the little dachshund is the very dog for the pesky ground hog. Could not our friend, Dr. Twaddell, who has bred the little German dog, tell us of his merits as a varmint exterminator? Maybe the Doctor knows "Lepus."—MAITRE ORBEAU.

RESEARCHES ON RABIES.—It will be remembered that Dr. Galtier, in a communication made to the Academie de Medicine of Paris, on October 27, 1879, appeared to establish, by a series of experiments, the transmissibility of rabies to the rabbit, and studied the period of incubation of the disease in animals. This period is, however, short, and scarcely exceeds an average of seventeen days. The question has been taken up lately by M. Lannelongue and M. Raynaud, in connection with the following case: A child, aged five and a half years, was admitted on the 8th of December, 1880, to the Hospital of Saint Eugenie, presenting unequivocal symptoms of rabies. He had been bitten on the 10th of November on the knee, on the left cheek and on the temporal region of the same side by a dog, which was immediately killed after having bitten other dogs, which were also killed. The first symptoms of rabies were manifested on the morning of the 7th of December, and the child died on the 11th of December after having shown typical manifestations of the disease Three experiments were made on a rabbit: 1, inoculation with fluids collected from the child while still living; 2, inoculation with different fluids or tissue taken from the body twenty-four hours after death; 3, subsequent inoculation from rabbit to rabbit. From this second series, two animals inoculated with bronchial mucus taken from the corpse died, one in twenty-four, the others in forty-eight hours. Three animals were inoculated with the *debris* of salivary glands; only one died, very rapidly however, at the end of eleven hours. The submaxillary gland furnished this positive result. The product of scraping the lymphatic glands, which were found swollen, was inoculated in two rabbits; one survived at nine hours and a half; the other became ill on the second day, and then recovered. A fragment of the medulla oblongata was inoculated in another rabbit, which died on the fourth day. In the third series of experiments, all the rabbits died which were inoculated with the saliva of one of the animals which died in the preceding experiments. All the rabbits, five in number, succumbed in spaces of time varying from twenty to thirty hours. Twice the blood of a rabbit, killed by inoculation of the blood, was taken immediately after death, and inoculated on another rabbit; it caused death once in forty-two hours, and, in the second case, in forty-three hours. The blood of the latter rabbit, also taken after death, killed a third rabbit in thirteen hours. M. Maurice Raynaud is of opinion, until the contrary is proved, that these rabbits really died of rabies: and he considers that he has a double reason for so thinking—the impossibility of explaining their death otherwise, and the evidence of that cause of death in the human subject from which the inoculation was made. M. Pasteur addressed the Academy, and drew a figure of the parasitic organism which he found in the saliva of the patient of MM. Maurice Raynaud and Lannelongue. M. Pasteur did not admit, however, that the disease observed in the animals in which he had performed these inoculations was rabies. He considered, on the contrary, this disease as a new affection not described and not observed previously, but certainly produced by the parasite which he had isolated and cultivated A discussion arose between M. Colin and M. Pasteur, the former being of opinion that the animals died of septicemia, which M. Pasteur denied. It resulted from this discussion, that the disease produced by the inoculations of M. Pasteur was not rabies, since it represented neither the period of incubation nor the symptoms of rabies. Various hypotheses may be formed as to the nature of these differences, but none is at present satisfactory The subject is one, however, of which the importance cannot be overlooked, and must be highly estimated. The results which have recently been obtained by M. Pasteur, and M. Jaccoud, and Dr. Lannelongue in this country following in their steps, in relation to the cultivation of parsitic organisms connected with infectious disease such as splenic disease or fowl-cholera, all point in the same direction, viz., to the possibility of attaining preventive, and probably therapeutic, means, by the aid of this line of physiological investigation; and however much antivivisectionists may rage against experiments of this kind, it is certain that they will not carry with them reasonable people in any opposition to a line of experiment which has already been productive of vast benefit to mankind, and is apparently on the eve of yielding results of inestimable value and extensive application in the prevention of the most destructive, and at present, incurable forms of disease. Inoculation or invaccination of poisons, modified by passing through various animal organisms, lead to results which may, on the one hand, be preventive and prophylactic, as in the case of small-pox, fowl-cholera, bacteria and splenic disease and may, where such preliminary prevention is, by the circumstances of the case, put out of the question, be useful in the early stage in producing a mild concurrent form of disease, which may greatly modify the more violent poison—*British Medical Journal.*

"CITY DOGS."—I do not know of a section of the country where more really fine field dogs can be found than at and about Milford, Harrington and Georgetown, Del. Fully two-thirds of the animals I have seen at these places are as well bred as any natives in the land, and very many show the blood of the late imported strains. I learn from the sportsmen of these sections that their setters and pointers are bred from "city dogs"—in fact many were once "city dogs." It is very amusing to hear the resident sporting men of the towns mentioned describe the working of these animals when they first come to "our country." Said one John W. to me not long since: "You fellows from town are very unreasonable, and appear to think because you've got a high-price setter or pointer that they will go right to hunting like one of our dogs as soon as he's taken into the field." "Well, he does a mighty sight of hunting to be sure, and chasing, too, but no pointing." "They are no good for three or four days. When they first come down they are hog fat, been chained up for six months and half crazy to get out, run wild." "Most of you only come down for two or three days' shooting, and it takes that long to run your dog into anything like the temper for work." "You then go home disgusted with your dogs and leave them behind to be hunted." "It makes no difference if your dog has once been broken, he forgets when he goes into the field again, for he has been kept on the chain all the time except when you walk him in the street or take him to one of your great shows." "We don't find fault with the breeding of your dogs, for there is just where we get ours, and see what we make of them."

"A duck is mighty apt to forget something about water if kept away from it half her life, and it is scandalous to think a setter or pointer, after being shut up and only looked at and talked about for a whole year, can be expected to do good work the first trip of the season." "Why, he's crazy with delight, and nothing good can be got out of him until the 'wire edge' is worn off of him and he is in a condition to know what he is about." "Your prize dogs are fine to look at, but most of them need a country education" "There are a lot of them down here a year or two back from a kennel near New York with their owners for snipe. All they could do was to fetch and carry corncobs, 'down charge,' and bark and run around one another when I saw them ont. And there were lots of snipe about, too, but none killed by this party."

I have given as near as I can remember the exact words of my friend in his description of "our dogs from town." The practical sportsman who reads them can sympathize with honest John in his disgust, and recognize in the owners of what he in general terms designates "city dogs" those that do most of their shooting indoors. "HOMO."

THE BENCH-LEGGED BEAGLE QUESTION—Baltimore, March 19.—I notice in your paper of the 17th ult. an article on the "Bench-Legged Beagle," by Doctor Maddux, of this city. As I am one of those that he has been pleased to style "interested scribblers," I hasten to reply. It affords me pleasure to have this opportunity to ask, through the columns of your valuable paper, some questions which I hope the champion of the "bench-legged" beagle will answer. The first I wish to propound is: Did he ever breed one of his straight-legged beagles to a dachshund dog owned by Mr. Groveman, a resident of this State? Secondly, When did his bench-legged "bench-legged" beagles first sad for whom? also, through what port were they entered? Thirdly, Who are the owners of the half-dozen or more packs of "bench-legged" beagles spoken of by the gentleman as owned within a radius of ten miles of this city? I also wish to state in this connection that I am an old Marylander, being a native resident here all my life. Consequently I ante-date the gentleman as a resident many years, he having come here from an adjoining State. I have also been a sportsman for many years, but have not been in any of many rambles, and they have extended to the remotest sections of this State, had the misfortune to see a deformed beagle, styled by the gentleman as the "bench-legged" beagle. I would also inform the Doctor that I have owned and hunted over as pretty and finely-bred straight-legged beagles as ever followed a "cotton-tail." The Doctor asserts in his article that the "bench-legged" beagle is just as well established as a separate and distinct breed of dogs as the Gordon setter or the Chesapeake bay dogs are, etc. As the Doctor has taken the Gordon setter for an example, I wish to call the attention of the readers of this article to the following, which was written by or for the Doctor, and which appeared in one of your contemporaries, under date of January 8, 1881, being a question as follows, viz.:

Please decide the following bet: Would you consider a litter of pups to be genuine Gordons under the following circumstances: My Gordon intelligent setter, one of which is a red Irish in appearance, and such has been the case with each litter; the bet was made with the agreement that you were to decide it. The answer to the initials "A. R. B., Baltimore," was yes, etc.

Now, I claim that as a breeder of Gordons who has to ask for a decision in such a simple matter as the above, his opinion is worthless, as regards purity of blood of the Gordon setter as well as of the type and purity of the old Maryland beagle.

Allow me to thank you for the space I have occupied in your valuable paper, and lest, but not least, permit me to thank the members of the Westminster Kennel Club for their wisdom in not forming a class for this new innovation styled "Bench-legged Beagles." BEAGLES.

JESSUP, MD.

Editor Forest and Stream:

I am pleased to be able to give some definite information as to the introduction of the "bench-legged beagle" or "Basset" into Maryland. In 1842, Col. John S. Skinner, at that time editor of the *American Turf Register and Sporting Magazine*, had presented to him a pair of bench-legged beagles selected from the Queen's pack by a friend in England. Col. Skinner gave these hounds to Paymaster Andrews (afterward Paymaster-General), U. S. Army, who sent them to his residence, Roxbury Mills, Montgomery Co., Md. This farm is now owned by Hon. A. Bowie Davis, and this same strain of dogs—kept strong and pure by more recent importations—are still bred in that county. I am indebted for this information to Gen. R. Snowden Andrews, Baltimore, Md., son of the late Paymaster-General. Gen. Andrews distinctly remembers the original pair, and says they were very similar in shape, size and color to the pair Doll and Dale that were awarded prizes at Pittsburgh.—FRANK A. BOND.

THOSE NERVOUS DOGS—Hillsdale, Mich.—In your issue of the 17th I find the following statement over the signature of "Homo." It is a fact that few breeders will deny that all blue-blooded dogs, the Laverack setter in particular, are as a rule excessively nervous, and that a great deal of unless great care is observed in training are apt to be gun shy or "bolters." As a breeder of experience at least superior to "Homo's," I wish to deny this assertion in toto, so far as it applies to either Llewellin or Irish setters. I have bred many of both breeds, especially of the former, and have never seen, even among the coarsest natives, dogs of better courage, less nervousness or less inclination to gun shyness. The Llewellins are natural hunters, and instinctively love the gun. Of all I have bred but two have ever shown gun shyness, and one of those was made afraid of everything by over severity in breaking her from killing chickens. I do not believe there is in the world a breed more generally bold, gun loving and free from nervousness. I have had also an extensive correspondence with English breeders of Laverack setters, and from what I deem competent information I am convinced they are seldom or never naturally gun shy. As I have never bred Lavercks myself, I will refer your readers to Mr. J. G. Higgins or Mr C. R. Raymond, who have had as much experience with this grand strain as any gentlemen in America. Mr. James Moore, of Toledo, can answer for the Gordons, and the St Louis Kennel Club will doubtless satisfy any doubts as to pointers.

"Good wine needs no bush," so I seldom trouble myself to controvert such absurd statements as the above. "Homo," however, has written himself into a quasi prominence, and his opinion may have some weight with those who do not know that his experience in breeding him has been confined to the most brief and limited character, and his information, such as it is, culled from books with the hope of inducing the public to regard him as a dog star of the first class. Those who know him will take his assertions with the proper degree of allowance, and those who do not will find a far better guide in any of the host of actual breeders scattered over the country. ARNOLD BURGES.

A DISGUSTED SPORTSMAN—Cedar Point Landing, Goochland Co., Va., March 12.—To my mind, as a practical sportsman, field trials are excellent institutions in themselves if properly carried out, but there's the rub. Under the present regime they have a tendency to discourage all true sportsmen from entering their dogs and lending their assistance to promote the interest of the most healthful and manly sports. On being asked a few days since by a would-be sportsman the object of field trials, I replied that they were instituted for the purpose of introducing some particular strain of dogs to please the gentlemen sportsmen, who have about as much idea of the good points of a dog and how to break him as they do to handle him after he is thoroughly broken, and that they also proved an excellent advertising card for breeders and professional handlers, affording an opportunity to gamble in a

gentlemanly way upon the points of the dog.

My experience in breaking dogs is by no means limited. I break them for my own use, knowing better my own wants than any professional, and I know that all true lovers of field sports endeavor to do the same. I had the pleasure of shooting over a field trial specimen, fresh from the hands of a professional handler, and must confess that had I my choice between the dashing, blooded dog of field trial fame and my native English setter I would by all odds take the native, because he found more birds and was more staunch on his points than his blooded companion. I shot over one of my native pups and, as far as I am capable of judging, pronounce his education as near perfection as can be. He is broken to execute my orders both by whistle and signal, readily dropping to wing or shot and retrieving without a taint. The height of my ambition has been to take my dog to the field trials, but I am deterred by the fact that his tail is too far below the gambrel joint and I don't advocate docking; nor does the feather extend below that joint. Then, again, his color might be objected to, for gentlemen sportsmen don't think that a good dog can be any color. My sole object, Mr. Editor, is to promote a true interest in field trials and give to the dog that will do his duty the credit he deserves. K. B. P.

MORE VANDALISM.—London, Ont., March 24. —Mr. G. S. Murray, of St. Thomas, Ont., is the latest sufferer. On the 23d his beautiful Gordon setter bitch Eden was stolen from him about noon. He immediately put himself in communication with the detectives and telegraphed to Annesburg, Detroit, Suspension Bridge and Fort Erie. The consequence was that the thieves could not get the dog away. At 2 A. M. on the following morning he heard footsteps approaching his house. On going out he found poor Eden thrown over his fence *in extremis*. She had evidently been much abused, and died in less than an hour

Eden was a very promising young bitch by Toledo Kennel Club's Grouse, out of Dr. Niven's Matt III.; had been well broken and was in whelp to Blossom and due in about ten days. Mr. Murray feels his loss very much, as he had become very much attached to her, as well for her kindly disposition as her excellent field qualities. It seems a pity that such acts should be committed and the actors not be amenable to the law. If it were a horse or a cow, not worth one-half what Eden was, the strong arm of the law could be invoked and the guilty persons punished.

On hearing of Mr. Murray's loss Dr. Niven at once presented Mr. Murray with a fine young bitch pup, seven months old, by Blossom out of Matt III., with the hope that she may be more lucky in her future than Eden.

NATIONAL AMERICAN FIELD TRIALS DERBY.—The following entries have been made since February 24 for the second annual Derby:

David McK. Lloyd enters Mack Laverack, lemon Belton setter dog out of Peeress by Thunder, whelped April 2, 1880; Jos. J Snellenburg enters Lu Laverack, lemon Belton setter bitch out of Peeress by Thunder, whelped April 2, 1880; Jos. J. Snellenburg enters Pet Laverack, black and white setter bitch out of Peeress by Thunder, whelped April 2, 1880; Edward E. Hardy enters Clair, black and white setter dog out of Diana by Dash III., whelped May 15, 1880; Edward E. Hardy enters Clairine, black and white setter bitch out of Diana by Dash III., whelped May 15, 1880; Edward E. Hardy enters Pollux, black and white setter dog out of Diana by Dash III., whelped May 15, 1880; Edward E. Hardy enters Saunterer, lemon and white setter dog out of Frost by Scout, whelped April 20, 1880.

A. W. Blakemore enters Bonnie Scotland, white, black and tan setter dog out of Kansas by Lincoln, whelped May, 1880.

L. H. Smith enters Two Morton, black, blue Belton and tan setter bitch out of Clip by Gladstone, whelped July 22, 1880.

L. H. Smith enters Lass of Kindale, blue Belton setter bitch out of Clip by Gladstone, whelped July 22, 1880.

Jos. H. Dew, Secretary, N. A. K. C.

ESSEX COUNTY HUNT.—The following are the dates of the spring meets: Saturday, April 2, 4:30 P. M., entrance of Fair Grounds, Waverly, N. J.; Wednesday, April 6, 4:30 P. M., residence of Mr. J. Burke, "Woodlands," Llewellyn Park, Orange, N. J.; Saturday, April 9, 4:30 P. M., South Orange, N. J.; Wednesday, April 12, 4:30 P. M., Ridgewood Station, N. J.; Saturday, April 16, 4:30 P. M., Stone Quarries, Bloomfield ave., Newark, N. J. The Hunt will continue to keep the hounds at the present temporary kennels at the east end of Walnut street, Montclair, until after the Spring Meets. Parties from the city can find accommodations for their horses at the kennel stables.—H. N. Munn, M. F. H.

JOCKEYING AT FIELD TRIALS.—Gilroy, California.—*Editor Forest and Stream:* I think you were right. There was considerable "jockeying" at the Eastern Field Trials. What right had Watford to make Gladstone circle round Nat, and take away her point? Nat had evidently made the birds first and was going up to them in his own way.

Dogs ought to be handled by the owners—what are they broken for—and they ought not to be spoken to on the field; merely a whistle and a wave of the hand. I have had dogs broken so that you need never speak to them during a day's hunt. A dog that is well broken will hunt as well for one person as another, and behave as well. Again we hear too much about speed. Speed and scent cannot exist together. Style is good, but not speed. At least them's my sentiments. E. Leavesley.

MOUNT AIRY KENNEL AND GAME ASSOCIATION.—A special meeting of this newly-organized association was held on Monday evening, March 21, at Mount Airy, Philadelphia, Pa., at which its constitution and by-laws were adopted and the election of officers for the ensuing year took place. The association has a membership of thirty-five gentlemen interested in sports of the field and flood, which promise to have the preservation of game at heart. Regular meetings will be held on the first Monday in every month, and we shall hereafter take pleasure in giving the news of the club. The officers of the club are: President, Mr. John Eray; Vice-Presidents, Messrs. George Linck and Saml. T. Godfrey; Recording Secretary, Mr. G. W. H. Smith; Financial Secretary, Mr. Abram Willis, Jr.; Treasurer, Mr. Wm. McCallum.

THE BEAGLE IN CANADA.—Guelph, March 10.—I am glad to see you advocating the breeding of beagles in this country. In the near future we will have little game to work setters and pointers on. But give pass a reasonably close season and a good swamp for cover, and those who care for that kind of sport can always have plenty of it. I was out only twice during the past season and succeeded in bowling over a few, with two or three good and fast dogs. It takes quick work to kill hares crossing the paths and narrow roads in the swamps. I cannot close without complimenting you upon the continued improvement you are making in the Forest and Stream. Its readers are certainly getting good value for their money; so thinks your old subscriber.—C. A. P.

NOTES FROM ABROAD.—Mr. J. Woodroffe Hill, F.R.C.V.S., a correspondent in *The Stockkeeper*, writes as follows about large mastiffs: "'Sirius' is certainly mistaken in considering 14 st. the heaviest weight known in the mastiff world. My late mastiff Scawfell, who formerly belonged to Mr. Hartley, of Windermere, weighed, in light condition, when his portrait was taken for the frontispiece of my book of the dog, 186 lbs., and before he left my possession he turned the scale, *in show condition*, at 206 lbs."

Forthcoming Field Trials at Cologne.—From a printed communication sent us by Mr. Emil Meyer, of Hanover, we perceive that no less than fifty-one entries have been secured for these trials. This points to a probable first-rate meeting, and we congratulate the management on the success which has so far rewarded their efforts.—*The Field.*

LOST.—51 West Twenty-sixth street, New York, March 25.—I have had the misfortune to lose my fox terrier bitch Lady Gay (Paulo–Nettie). She is remarkably well and evenly marked, the head black and tan with white down the centre; body white with exception of black spot on the side; tail short, black on top and tan underneath, with about an inch at the end white. She was lost last Friday evening in the neighborhood of Fiftieth street and Sixth avenue. Should any of your readers, either in or out of the city, have a dog offered to them that fills the above description I would consider it a great favor if they would let me know.—John E. J. Grainger.

BELTON.—Mr. John Bolus, Killbreck Kennels, Wooster, O., has sent us a photograph of a picture of his celebrated black, white and tan field trial setter Belton. The picture shall be added to our large collection.

THE BEST PAPER.—Carter's Creek Station, Maury Co., Tenn., March 12.—*Editor Forest and Stream:* I am happy to say that in my opinion your paper has improved, and I think now is the best paper of its kind in America. Your article on dog jockeying made you a great many friends. You did great service to the sportsmen of this country in showing up Whitford and Co. to the public. Hope you will continue to show up all such when an opportunity presents itself, regardless of any one. I will try to give you my views about running field trials before long.—G. W. Campbell.

KENNEL MANAGEMENT.

109 J. H. B., Ironton.—I have a setter puppy fourteen weeks old. He is in good health as far as I can see, but within the last ten days his forelegs have become very much bowed outward. Is there any way to prevent it or cure it? Do not chain the puppy up, but always give freedom. We presume you do not kennel him in a barrel? Young dogs, in straining on a chain, are apt to get themselves out of shape.

110 H. P. K., Springdeld, Ohio.—Your four-months-old puppy is afflicted with worms. Give the following vermifuge in a little milk after ten hours' fasting: Powdered areca nut, one scruple; santonine, two grains, made into a pill or bolus. Repeat the dose in a week. See that the areca nut is freshly powdered.

111 J. C., Lincoln, Maine.—The Forest and Stream of August 1, 1878, gives the full information you want. We do not believe in the practice, believing it to be inhuman.

112 W. R. H., Catskill, N. Y.—I have a small black and tan bitch, weight about six pounds, from which I wish to get a litter of very small pups. The only small dog I can find (that I like) is her father. He will weigh seven or eight pounds. He produced one pup out of a half-breed bitch which weighed but two pounds at the age of six months, and it is as fine an animal, to all appearances, as I ever saw. If I put my bitch to the right pound dog (her father) would the get be apt to be small? Ans. The pups are likely to be small on account of the close in-breeding. Early separation from the mother is likely to affect their health more than their size.

113 C. H. W., Hancock, Minn.—I have a water spaniel who has for three weeks past had a habit or yelping whenever he attempted to stool. I gave him a mild bolus, supposing him to be costive, but it only increased his yelping. On examination there is a swelling around his anus. He will allow me to examine him and press on all parts, exhibiting no pain until his tail is raised above his back, which seems to hurt him greatly. I have now given him medicine to stop the action of his bowels. He seems lively and anxious to play, but keeps his back curved and seems restless. He is subject very often to severe fits of shivering, although his kennel is warm. At times he seems to be in pain, but has moaned only once or twice since I have noticed his sickness. Can you tell me of anything to help him? Ans. Probably he has an abscess forming within the rectum or in the soft tissues at the root of the tail. This should be opened early and he should have purges of sulphate of magnesia and castor oil.

114 Flushing.—I have a pointer sixteen months old. He refuses to eat anything in sufficient quantities; he is consequently a skeleton. He seems, when taken out, lively enough. I keep him tied in most of the time, as I am away from home a part of the day. There is always, since he got sick, a quantity of saliva running from his mouth. I have given him castor oil and sulphur at different times. Could you give me a remedy? Ans. The dog needs more exercise and freedom. He may have worms. We advise you to try for them by giving the following vermifuge after a day's fasting: Powdered areca nut, two scruples; santonin, four grains. Castor oil is the best purgative that can be given after a vermifuge.

115 G. F. B. K., Windsor, Conn.—Will you kindly inform me what to do for my dog, whose symptoms are as follows: Paws his ears with great violence, whines cruelly for several minutes, and has a hot, dry nose; his ear (internal) is somewhat inflamed, but not enough so to account for his strange actions. I should mention that his trouble is paroxysmal and all the symptoms disappear at times. Ans. Probably canker of the ear. Physic him on low diet, give occasional free purges of sulphate of magnesia or castor oil, also give a little sulphur with his food once a day and plenty of exercise. Cleanse the ear with warm water once a day.

KENNEL NOTES

*** Breeders and owners of dogs are invited to send memoranda of names claimed, bred, whelps, sales, etc., for insertion in this column. We make no charge for the publication of such notes; but request in each case the notice be made up in accordance with our form, that the name of both owner and dog be written legibly, or printed, and that the strain to which the animal belongs be distinctly stated.*

NAMES CLAIMED.

Rex—Mr. Herman Hoops, Philadelphia, Pa., claims the name of Rex for his black and tan Gordon setter dog, whelped April 29, 1880, out of Torpin's Fly by Dixon's Hector.

Scott—Mr. T. T. Sawyer, Jr., Boston, Mass., claims the name of Scott for imported Gordon setter dog out of Nellie by Champion Reuben.

Van. Mr. S. E. Holder, New York, claims the name of Van for black and tan foxhound bitch, white breast and feet, whelped October, 1879, by Mr. L. Woodruff's Drive, by Barker's blue dog, by Old Frank and a long line of celebrated dogs. Dam, Echo, a Virginia bitch, out of Dr. Southall's Belle by Ring, and so on from a strain kept perfectly pure for fifty years in this country. Belle was a gray fox dog and Ring a red fox dog. Drive has caught several foxes by himself since he was nine years old.

Bob White—Mr. Henry Bger, Brooklyn, N. Y., claims the name of Bob White for his black, white and tan setter dog, whelped January 2, 1881, out of Mr. E. L. Miles' Topsy (Cherry-Skip) by Mr. Babcock's black and tan Gordon setter Sport. Bred by Mr. E. L. Miles, Sag Harbor, N. Y.

Correction.—Mr. Everett Smith, Portland, Maine, claims the name of *Cosette*, not *Cossett*, as erroneously published in last week's issue.

Floss II.—Dr. Jos. R. Housel, Watsontown, Pa., claims the name of Floss II. for red Irish setter, whelped March 3, 1880, out of Mr. Montgomery's Elsie by Dr. Jarvis' Champion Echo.

June—Dr. Jos. R. Housel, Watsontown, Pa., claims the name of June for orange and white Gildersleeve bitch, whelped June 5, 1880.

Countess Rose—Mr. Andrew J. Ward, Boston, Mass., claims the name of Countess Rose for his white, black and tan ticked Llewellin setter bitch out of Flirt by Fred.

Blutch II.—Mr. Andrew J. Ward, Boston, Mass., claims the name of Blutch II. for foxhound puppy, seven months old, out of Posey by Blutch.

Slouth—Mr. Andrew J. Ward, Boston, Mass., claims the name of Slouth for foxhound puppy, seven months old, out of Posey by Blutch.

Peggie—Mr. Patrick J. Coffey, Boston, Mass., claims the name of Peggie for his lemon and white setter bitch puppy three months old.

Harry Hay—Mr. W. Henrickhouse, Coshocton, Ohio, claims the name of Harry Hay for liver and white cocker dog pup, whelped January 22, 1881, out of Fanny Fern by Captain. Purchased from the Blue Star Kennels.

Correction.—*Little Dorrit*—Mr. J. H. Winslow, Baltimore, Md., claims the name of Little Dorrit for wire haired fox terrier bitch, thirteen months old, by Riot out of Dusty. Bred by Mr. C. Burgess, The Grange, Partney, Lincolnshire, England. Little Dorrit is white with black and tan mark on head and is a very game bitch.

[The above claim appeared in issue of March 24. Our printer made it read *white* haired fox terrier instead of *wire* haired fox terrier.]

Jolly—Mr. James Conlisk, Buffalo, N. Y., claims the name of Jolly for imported black and tan English harrier hound dog (Tyrant–Tuneful). Imported by Mr. A. W. Manley, Meaford, Ont., from the kennels of Lord Fitzhardinge, Berkley Castle, Gloucestershire, England, in October, 1877.

Bristol—Mr. James Conlisk, Buffalo, N. Y., claims the name of Bristol for imported harrier hound bitch, white, black and tan (Diamond–Comfort). Purchased in Bristol, England, of Mr. John Sogardon, June, 1877.

Catto—Mr. James Conlisk, Buffalo, N. Y., claims the name of Catto for white, black and tan harrier hound dog, whelped October 16, 1879, out of imported Bristol by imported Jolly.

Ninety-nine—Mr. J. C. Bishop, Monson, Maine, claims the name of Ninety-nine for black and tan fox hound bitch, whelped February 23, 1881, out of Belle (Chase–Fan) by Ben (Driver–Reno).

Julie—Mr. H. A. Clock, Geneva, Iowa, claims the name of Julie, whelped October 27, 1880, out of owner's Irish Countess by owner's Irish Ranger.

Beau—Mr. J. F. Kirk, Toronto, claims the name of Beau for liver colored spaniel imported from Mr. Jacobs' kennels by Kaffir out of Squaw.

Jet—Mr. J. F. Kirk, Toronto, claims the name of Jet for black spaniel bitch imported from Mr. Jacobs' kennels, by Nigger out of Belle.

BRED.

Dolly-Tom—Mr. Fred. A. Taft's Gordon bitch Dolly (half-sister to his Dorr) to Mr. C. T. Bailey's Tom, formerly Doane's Tom.

Gypsey-King—The Essex County Hunts' imported beagle bitch Gypsey to Mr. N. Elmore's King, March 22.

Cossette-Flute Mr. N. Elmore's beagle bitch Cossette (imported Chanter–Beauty) to Flute, March 7.

Sue-Hoot—Mr. N. Elmore's blue mottled foxhound bitch Sue to Hoot, March 7.

——— *Belton*—Messrs. Rockhill Bros.' lemon and white native English setter bitch to Mr. John Bolus' imported field trial setter Belton, March 19.

Dot-Dandy Mr. John Berry's Dot to Mr. John Bolus' Skye terrier Dandy, March 5.

Pet Prince Mr. E. F. Morcelliott's champion English pug Pet to Madame Geistinger's Prince, presented by Queen Victoria.

Skip-Ien—The foxhound bitch Skip (Old Boney–Fan) to Mr. J. C. Bishop's (Monson, Me.) black and tan foxhound Ben (Driver–Reno), March 21.

Ollie-Warwick—Mr. H. W. Gause's (Wilmington Del.) Llewellin setter bitch Ollie (Llewellin's Dan–Petrel) to Warwick.

Kit (Elcho–Bridget Plunkel) to Mr. Sanborn's Brutus (Berkley–June), March 20.

WHELPS.

Nellie—Mr. D. B. Andrews', Hamden, N. Y., cocker spaniel bitch Nellie whelped March 21, six liver colored dog puppies by Moserip's Jupiter.

Rena—The Oxford Kennel Club's (Tilsonburg, Ont.) lemon and white pointer bitch Rena (Sensation–Orgill's Rose) has whelped seven puppies (five dogs and two bitches) by their Chair pion Chippa (Cæsar–Nell).

Border Lilly—Mr. J. E. Fisher's (Brooklyn, N. Y.) Gordon setter bitch Border Lily whelped March 19 five puppies (four dogs and one bitch) by Dr. H. F. Aten's champion Glen.

SALES.

Floss-Elsie Whelp. Mr. T. P. Montgomery, Harrisburg, Pa., has sold to Dr. J. R. Housel, Watsontown, Pa., the red Irish setter bitch Floss II., out of his Elsie by champion Echo.

Baron Walkdeer—Mr. John P. Banard, Jr., Boston, Mass., has sold to Mr. L. C. F. Lotz, Chicago, Ill., the greyhound dog Baron Walkdeer.

John Kelly—Mr. John P. Banard, Jr., Boston, Mass., has sold to Mr. E. De Renne, New York, the dog John Kelly.

Blossom–Moll III. Whelp—Dr. J. S. Niven, London, Ont., has sold to Dr. D. M. Farer, Stratford, Ont., a Gordon setter puppy out of Moll III. by Blossom.

Maida—Mr. N. Elmore, Granby, Conn., has sold to Mr. H. G. Jerome, Uncasville, Conn., the eight months old beagle bitch Maida out of Lady by Victor.

Victor-Rena Whelp—Mr. N. Elmore, Granby, Conn., has sold to Mr. Dan Stores, Lebanon, N. H., a three months old beagle bitch puppy out of Bess (First Boston, 1878) by Victor.

Sweetheart—Mr. Leon Burgess, Woodstock, Ont., has purchased of Mr. James Conlisk, Buffalo, N. Y., the white, black and tan harrier hound Smalley, whelped October 15, 1879, out of Bristol by Jolly.

Ronnie—Mr. Chas. Baker, Toronto, Ont., has purchased from Mr. James Conlisk, Buffalo, N. Y., the white, black and tan harrier hound bitch Bonnie, whelped Oct 15, 1879, out of Bristol by Jolly.

PRESENTATION.

Garm—Dr. Albert H. Buck, New York City, has presented to Mr. Thomas D. Rich, Eastchester, Westchester Co., N. Y., his English mastiff dog Garm.

IMPORTATION.

Brace of Spaniels Mr. J. F. Kirk, Toronto, has received in good condition, by steamship "Britannic," a pair of spaniels from the kennels of Mr. T. Jacobs, of Newton-Abbott, Devonshire, England. The dog is white, liver colored and is bred out of Squaw by Kaffir. The bitch is pure black and is by Nigger out of Belle.

DEATH.

Eden—Mr. G. S. Murray, St. Thomas, Ont., has lost his Gordon setter Eden either by violence or poison.

Volume 3 of the English Kennel Club's Stud Book will be issued about the end of April.

Rifle and Trap Shooting.

The Boston Galleries.—At the Maguolia Gallery the All-Comers' match is really popular. Mr. Arthur is still at the head for 246 in the Forest and Stream match, and Dunn, with 317 in the Pistol match, is the peer. The summary gives the shooting for the week:

All-Comers' Match—Possible 250.

J Merrill	245	C Jones	235
E Harris	243	M Drew	234
C A Maynard	240	R Watters	233
C Abell	240	J Ross	233
O A Gross	240	J B Fellows	233
S Fogg	239	A Law	230

J Ames	295	E Wilder	202

The Mammoth Gallery has been patronized during the week, both day and evening. The different rifle associations in the vicinity have all been represented and capital work has been accomplished. A. C. Maynard takes first position with 182 in the Amateur Badge match, followed by Pratt for the same amount—a perfect tie. In the Forest and Stream match W. H. Harrision takes first position for 193. In the Pistol match J. H. Williams heads all comers for the fine showing of 231.

Amateur Badge Match—Possible 200.

A C Maynard	182	G Weymouth	166
M L Pratt	182	W M Norcross	172
Steve Williams	176	J Cobe	162
S B Brown	175	Nichols	162
H Sinclair	170	S Aronson	161
Allen F Kelley	168	A H Nourse	164
F L Shannon	168		

Experts' Match.

Arnold	38 38 39 39 39—193	Williams	37 37 37 37 37—185
Merrill	37 38 38 38 38—189	Bartlett	36 36 37 37 37—183

Forest and Stream Match.

Harrison	38 38 39 39 39—193	Fogg	37
Sherburne	37 38 38 38 38—189	Robinson	36
Arnold	37 38	Goodspeed	36
Ross	37	Hart	36
Bartlett	36	Dally	36

Pistol Match.

Williams	75 78 78—231	Wilder	67 68 70—205
Rabbeth	67 70 71—208		

West Medford, March 18.—The annual meeting and election of officers of the West Medford Shooting Club occurred to-day. The following gentlemen were elected: President, C. M. Barrett; Vice President, W. T. Morse; Treasurer, J. E. Ober. Executive Committee: E. G. Morse, C. H. Parker, J. A. Rockwood: Secretary, W. T. Morse. The interest and membership has increased largely the past year, during which time the club has located a range and erected suitable buildings thereon, which are surpassed by none in the State for trap shooting purposes. The next meeting will be the annual field meeting, which takes place Fast Day, April 9, at 9 o'clock, at their range on College Hill.

BOSTON, Mass., March 26.—The attendance to-day was not large, and it was a disagreeable one for the meet, for a cold, chilly atmosphere, with a northwest wind, impossible to control by the most expert riflemen, kept down the large scores which have been recorded during the past month. The light was good during the major part of the shooting. The long-range men were out, but only shot at 800 yards. Mr. J. F. Rabbeth made the elegant score for the day and conditions in the Record match of 47, followed close by Gould and Arthur for 46 respectively. There were a large number of entries, but only the best finished scores are given :

Record Match (Creedmoor).

Rabbeth	5 4 5 4 5 5 5 5 5 5—48	Curtis	4 4 4 4 4 5 5 4 5—43
Gould	5 5 4 5 4 4 4 5 5 5—46	Howard	5 4 4 4 4 5 4 5 4 4—43
Arthur	5 5 4 4 4 5 5 4 5—46	Fellows	4 4 5 4 4 5 5 4 5 4—43
Lee	4 5 5 5 5 4 4 4 4 5—45	Dudley	4 5 5 4 4 4 4 5 5 4—43
Conant	5 4 4 4 4 5 5 5 4—44	Borei	5 4 4 4 4 4 5 4 4 4—42

Record Match (Massachusetts Target).

Rabbeth	10 12 12 11 12 11 7—75	Harris	10 9 6 11 10 12 11 9—67
Warren	12 10 9 10 11 10 12—74	Gaines	8 10 12 12 12 8 6—68
Frye	10 9 11 11 10 12 10—73	Gray	8 11 10 9 9 12 10—67
Nichols	12 11 10 11 10 7 12—73	Bent	11 7 10 11 6 11 11—67
George	10 12 11 9 10 10 9—71	Burt	11 11 9 9 6 10 6—62
Francis	9 10 11 11 11 11 8—71		

MEDFORD, Mass., March 23.—The light breeze stirring this afternoon did not affect the scores of the riflemen gathered at Bellevue range and, as will be seen, some good scores were made. Out of the entries we subjoin the seventeen best :

J R Teele	48	J E Henry	43
F L Claflin	47	G C Arnold	45
A C Gould	47	C H Russell	45
G C Arthur	47	E Jamieson	44
H Widdington	47	G Hartwell	43
J Richardson	46	T R Jones	43
A C Gray	46	J Winslow	43
A Whitney	46	L L Fay	41
W Jacobs			

NEW ORLEANS, March 20.—The first shoot for the Parker prize, a silver pitcher, between members of the Orleans Artillery, took place to-day at the Louisiana Rifle Club grounds. The scores were as follows :

Alt. Moss	200 yards	3 2 3 3 3 3 3—20	
	500	2 3 2 4 3 3 0—18	38
W Schroeder	200	3 2 3 4 3 5 2—22	
	500	3 2 0 4 3 3 2—17	39
D Gaerdner	200	3 4 4 3 4 3 5—26	
"	500	3 0 3 4 2 3 5—20	46
aasman	200	3 4 3 2 2 3 3—20	
"	500	2 3 0 3 2 3 4—17	37
sson	200	4 2 3 5 3 2 5—24	
	500	3 2 2 4 3 3 4—19	43

BEACHMONT RANGE, Mass., March 19.—The Schutzen corps held its weekly shoot at Beachmont, to-day. A strong wind from the southeast gave considerable trouble, but, the light being good, excellent scores were made.

Massachusetts Target (Rest).

J H Max	12 12 10 12 11 11 11 10 11 11—111		
C M Guth	11 11 11 11 10 11 10 9 10 10—104

G Smith	8 4 7 11 6 7 11 7 7 10—78		

ALBANY, N. Y., March 17. A goodly number of riflemen were at Rensselaerwyck this afternoon. Two matches were to be shot, a subscription match at 300 yards, and a match at 200 yards, for a Wilkingson reloading machine. Promptly at two o'clock the subscription match was called. The conditions were not favorable for good scores, the light was of the best description, but a strong east wind blew directly in the faces of the marksmen and rendered it very difficult to hold. At the extreme short range distance, under the most favorable conditions, it is a very difficult matter to get a score which will average over centres, yet under the trying conditions of yesterday afternoon, five of the competitors were able to get an average of centres or over, which is a very creditable showing. Nearly all of the marksmen availed themselves of the privilege of re-entering, but the winning score was made by J. L. Miles, on an original entry. The detailed scores were :

Subscription Match, 300 Yards.

J L Miles, Bal S	5 5 4 4 4 5 4—31	W F Miles, S C	3 4 3 5 4 5 4—26
Geiger, R S	3 5 4 5 4 4 5—30	Dexter, S S	4 3 3 4 2 4 4—26
Mahone, Bal S	4 3 5 4 5 4 4—29	Cheever, R M	*2 4 3 2 4 4 4 3—26
Fitch, Bal S	4 5 4 5 4 3 4—29	Sanders, Hep S	3 4 3 3 3 5 5—24
Murphy, S M	*2 3 4 4 3 5 4 3—28	Charles, Bal S	3 4 4 2 3 3 3—22
Carpenter, S M	*2 3 4 3 4 4 4 3—27	Muldoon, Bal S	3 3 3 4 5 3 3—22

*Allowance to military rifles.

At the conclusion of this match the marksmen went to the 200 yards firing point to shoot for the reloading machine. The wind had increased and the light was failing. There was more trouble experienced in holding than in the previous matches. The re-entries were numerous, and, had the conditions been more favorable, we should not have been surprised to have seen more than one full score. In this match, as in the preceding one, James L. Miles again led all other competitors one point and was declared the winner on the good score of twenty-three out of the possible twenty-five points. It was emphatically Miles' day, and his reputation did not suffer.

The detailed scores were :

J L Miles, Bal S	5 5 4 4 5—23	Murphy, S M	5 5 4 4 4—22
Fitch, Bal S	4 4 4 5 5—22	W F Miles, S C	4 4 4 5 4—21
Geiger, R S	5 4 4 5 4—22	Carpenter, Bal S	4 4 4 4 4—20
Mahone, Bal S	4 4 5 5 4—22	Sanders, Hep S	4 5 4 4 4—20
Charles, Bal S	5 4 5 4 4—22	Muldoon, Bal S	3 4 4 3 4—18
Dexter, S S	5 4 5 4 4—22		

TO NEMO.—Will "Nemo," whose communication in regard to small-bore Express rifles appeared in our issue of March 17, please send his address to this office.

THE PISTOL TOURNAMENT—Conlin's gallery, 1,222 Broadway.—The fine display of pistol holding and work which has been going on at this gallery for the past ten weeks closed on Saturday evening last. Throughout the entire match the shooting public have taken an unusal amount of interest in the progress of the contest. The wonderful scores made well merited such attention, for it can be safely claimed that the shooting stands *par excellence* as the match records ever made in public. In some cases the scores are exhibitions of almost perfection itself in skillful marksmanship. The general plan was that the tournament would be held for ten weeks. During each week the championship for a certain style of shooting would be contested and the competitor making the best score to be declared the champion of such style of marksmanship. The contestant making the second best score to win an expert's badge, but in no case could the holder of championship win the expert's badge. The competitor winning the greatest number of championships to be declared the champion of pistol shooting for the year 1881. The following are the conditions and the names of the winners of each of the weekly competitions :

General Conditions.—The contests were open to all comers, any 22-100 calibre pistol allowed, barrel of which not to exceed twelve inches. The competitor to stand free from any rest or brace and to use but one arm, which must be free from any support, brace or rest of any kind.

No. 1. Championship of shooting at string measurement target (the total measurement in inches of each shot from centre of bulls-eye to centre of shot being considered the score); distances, 10, 15 and 20 yds ; 10 shots at each distance.

Wm. M. Chase, winner. Scores : 10 yds., 5 2-8 inches ; 15 yds., 6 2-8 inches ; 20 yds., 9 3-8 inches. Total, 20 7-8 inches.

Championship of shooting at suspended bullets, viz.: ¾-inch bullets, 7 yards ; ½-inch bullets, 10 yards, and ¾-inch bullets, 15 yards ; 10 shots at each distance.

D. A. Davis, winner ; scores, 7 yds., 7, ¾ bullets ; 10 yds., 5, ¾ bullets ; 15 yds., 3, ¾ bullets ; total, 15.

Championship of word shooting, 1, 2, 3, to be shot at ready measurement target (same as used in contest No. 1) ; 10 shots ; distances 10 yards.

Dr. E. T. T. Marsh, winner, score 5¼ inches.

Championship of shooting at swinging objects. The mark was an inch and a quarter wooden ball, swinging distance, 10 yards. The competitor hitting the most consecutive balls to be declared the winner.

Dr. E. T. T. Marsh, winner ; score, 14 consecutive ; Pierre Lorillard, Jr., winner Expert Badge, score 8 consecutive balls.

No. 5. Championship of shooting at ¾-inch bullets suspended ; distance, 10 yards. The competitor hitting the greatest number in 20 shots to be declared the winner.

D. A. Davis and Dr. E. T. T. Marsh "tied," each scoring 12 bullets. Dr. E. T. T. Marsh won on the shoot off. Wm. C. Southwick won the Expert's Badge, scoring 11 bullets.

No. 6. Championship of shooting at Small Objects.—The mark shot at was a medium sized tack ; distance, 7 yards. The competitor hitting the greatest number of tacks in twenty shots to be declared the winner.

Dr. E. T. T. Marsh winner. Score, 13 tacks.

Col. J. J. Dunn, winner Expert Badge, 11 tacks.

N. 7. Championship of shooting at Wimbledon target (one inch bullseye), distance, 10 yards ; ten shots ; highest possible score 50. H. W. Wickhams and Dr. E. T. T. Marsh tied, each scoring 49, but according to the conditions Mr. Wickham wins, Dr. Marsh's target having the wildest shot.

No. 8. Championship of shooting at ¾ inch bullets swinging at least eighteen inches ; distance, 7 yards. The competitor hitting the greatest number of bullets in twenty shots to be declared the winner.

Dr. E. T. T. Marsh, winner. Score, 16 bullets.

D. D. Davis, winner Expert's Badge, 8 bullets.

No. 9. Championship of shooting at aces. The competitor hitting the greatest number of aces in ten shots to be delared the winner.

D. A. Davis, winner. Score, 9 aces.

J. B. Miller, winner Expert's Badge, 5.

No. 10. Championship of shooting at Creedmoor target (1 inch bullseye) ; distance, 15 yards ; 10 shots ; highest possible score 50 points.

In this contest Dr. Marsh and Mr. Davis reached a tie at 48 out of the possible 50, but however this may result Dr. Marsh has carried off the championship. He is a physician of large practice in this city, and enjoys pistol shooting merely as a relaxation from professional duties.

ZETTLER RIFLE GALLERY—207 Bowery.—A match is now in progress at this gallery called the "Blank Target Match," with a number of really valuble prizes. The target is a decided novelty, being so arranged that it appears a perfect blank to the shooter and is furthermore a handicap, giving amateur shooters an even chance with the experts. The number of chances is limited to 200. Open to all comers.—W.

NEW YORK RIFLE GALLERY.—699 Broadway.—The shooting in the monthly match for March, 5 shots on ring target, 35 yards ; possible 125 :

H Oehl	120	C Etaynior	115
Wm Kilen	119	Wm Hayes	114
A H Anderson	117	G Joiner	114
Col Riggs	116	F H Harrison	114
G J Seabury	116	F Ronaldson	114
P G Fenning	116		

THE TRAP.

THE CHAMPIONSHIP CONTEST.

[From our Special Correspondent.]

WANDERERS' CLUB,
PALL MALL, LONDON, S. W.,
March 17.

The competition for the championship of the world, the magnificent cup, value one hundred guineas, presented by the proprietors of the London *Sportsman*, and a sweepstakes of £50 each, with gate money added, was commenced at the Union Club grounds, Hendon, on Monday the 14th and terminated to-day. There were thirteen entries, viz., Dr. Carver, Ira A. Paine, Messrs. Graham, Hadlow, Gordon, Cavendish, Radnor, Turner-Turner, Holledge, Brighton, Carrington, Scott and Beever. The majority of these being shooting names, it was decided that the men should shoot in pairs, the winners of the first heat to shoot against each other in the second round, and so on until the final. It was considered unfortunate that the two Americans should have been pitted against each other in the first round. The inclosed scores will give you the result of the draw, as well as all the rounds, including the final.

The conditions were 12-gauge guns, limited to 8 lbs. weight, 4 drs. of powder and 1¼ oz. of shot. Each competitor to shoot at 50 birds, thirty yards rise, the inclosure to be the boundary (about 60 yards). The two left in for the final to shoot at 100 birds each.

To insure the very best birds, the four great purveyors of blue rocks, Mrs. Offer and Messrs. Hammond (2) and Brown received timely notice from the proprietors of the *Sportsman*, who supplied (and paid for) the birds, to furnish the best Lidcombaire rocks, and better birds were never trapped. The clerk of the weather for once was in good humor, and everything combined to make the meeting a most enjoyable one.

Messrs. Brighton and Graham shot with guns by Messrs. Blissett and Tomes, of Holborn ; Mr. Baker, of Fleet street, supplied those used by Messrs. Radnor and Holledge ; Messrs. Riley provided for Messrs. Carrington and Turner-Turner ; "The Doctor" shot with the Greener he used when he beat Mr. Scott a short time back, and Mr. Ira Paine handled a fine double of Stephen Grant's.

The shooting on the whole was excellent, and in some cases wonderful, notably Scott's clean score of 26 in the final against Carver, the latter winning the cup and first money by a score of 79 to 74. Ira Paine shot indifferently, but he is completely out of practice, not having shot pigeons for two or three years and, as usual, he had dozens of excuses, saying that he had not quite recovered the effects of an overdose of zocodone taken the week before. It is not surprising that he did not show better form.

Mr. Holt, of the *Sportsman*, acted as referee, but his office was almost a sinecure, as he was only called upon once for a decision. The scores stood :

FIRST DAY, MARCH 14.

Brighton	10101 00011 10111 00111 01010 00010 01010 00100 10001 11010—23

Scott	11011 11111 11111 11111 11111 11110 01010 11011 00101 01111—40.

THE RIVERTON GUN CLUB TOURNAMENT.—The Spring meeting of the Riverton Gun and Rifle Club, open to members of the Narragansett, Maryland, New York, Philadelphia, Long Branch, Orange and Staten Island Gun Clubs, and the Westminster Kennel Club, was held at Riverton, N. J., Friday and Saturday, March 25 and 26. The weather throughout was fine, and a strong wind from the west made the birds nearly all hard drivers. The birds were fast flyers, and often wheshard hit would flutter out of bounds.

For the opening match the entrance fee was five dollars, seven birds ; handicap rise ; amended Hurlingham rules. Ties "miss and out." The first prize, an old English three-handled "loving cup" of hammered silver and forty per cent. of entrance fees was won by Mr. G. C. Carson, of the Philadelphia Gun Club. The second prize, a large polished bronze inkstand and thirty per cent. of entrance fees, was won by Mr. Wallace, of the New York Gun Club. The third prize, a hammered silver cigar lighter made in imitation of an old Roman lamp and twenty per cent. of entrance fees was won by Mr. G. Crump, of the Riverton Gun and Rifle Club.

Following is the score :

Edwards	27 yards	1 0 1 1 0 1 w	—
Carmen	27	1 1 1 1 0 1	— 5
Hammond	28	1 0 1 1 1 0	— 4
G Crump	29	1 1 1 1 * 1—1 1 1—9	
H Bickley	28	1 1 1 1 0 0 1	— 5
Wallace	28	1 1 1 1 1 1—0	— 7
Fishworth	24	1 1 0 1 0 1 1	— 4
G Crump	26	1 0 0 1 1 1 1	— 5
Arnold	30	1 * 1 1 1 0	— 5
Townsend	26	0 1 1 0 1 1 1	— 5
Tevis	27	0 1 1 1 0 *	— 4
H Carson	29	1 1 1 0 1 1—1 0	— 7
A Alexander	28	0 1 * 1 0 w	—
B Meredith	29	0 1 1 1 * 0 1	— 4
Edmunds	30	1 0 1 1 * 1 0	— 4
Minto	27	1 1 * 0 1 1 0	— 4
H Burroughs	27	1 1 0 0 1 0 1	— 4
F P Sands	29	1 1 0 1 1 1—1 1 0	— 8
Burt	23	1 1 0 0 0 1 0	— 3
C Lewis	28	1 1 1 1 1 1 1	— 8
J Burroughs	26	1 0 1 0 1 0 0	— 3
S Williams	28	1 0 0 1 1 1 1	— 5
Col Armstrong	29	1 0 1 1 1 0 1	— 5

*Dead out of bounds.

The next match was at six single birds, handicap rise, three pair of double birds at twenty-five yards rise. This match was commenced Friday afternoon, but birds that were expected not arriving it was postponed after the single birds had been shot until one o'clock Saturday.

The first prize, a piece of bronze presented by General E. Bard Grubb was won by Mr. Arnold, of the Riverton Gun and Rifle Club. The second, a vase, Grecian pattern, of silver, copper and bronze and twenty-five per cent. of the entrance fees, was won by Mr. Edwards, of the Philadelphia Gun Club. The third, a set piece "Game Birds," presented by a member of the Riverton Club, and ten per cent. of entrance fees, was won by Mr. Meredith, of the Riverton Club. The score was as follows :

		Single.	Double.
Hammond	26 yards	0 0 1 1 1 0	1 1 1 1 00— 7
Minto	28	1 1 1 * 1 1	1 1 0 0 00— 7
Clifford	28	0 0 0 0 0 0	0 0 w — 0
Edmunds	30	1 0 1 1 1 0	0 0 1 0 0— 5
F P Sands	29	1 * 1 1 0 0	0 0 w —
Wallace	28	1 1 0 1 0 0	0 1 0 0 w —
C Lewis	25	1 1 1 1 0 1	0 0 1 1 0 —1 8
G R Crump	26	1 0 1 1 0 1	0 1 1 1 0 —1 7
H Burroughs	27	1 * 1 0 1 1	1 0 1 0 1 — 8
S Williams	28	0 1 0 1 1 1	1 0 0 0 w —
F C Arnold	30	1 1 1 0 1 0	1 1 1 1 1—10
Wise	28	0 1 0 1 1 1	0 1 0 0 1— 6
G Crump	29	0 1 1 1 1 1	0 0 w —
B Meredith	29	0 1 1 1 1 1	0 0 1 1 1— 9
Carmen	27	1 0 1 1 1 1	1 1 0 0 00— 7
Roberts	26	0 0 1 0 1 0	0 0 w —
Scott	26	0 1 1 0 1 1	0 0 w —
Edwards	27	1 0 1 1 1 1	0 1 1 1 1—10
Col Armstrong	29	* 1 1 1 1 0	0 1 1 0 0— 7
G C Carson	28	1 1 0 1 1 0	1 0 0 1 w —
Bickley	28	1 1 0 1 1 1	0 w —
Townsend	26	0 1 1 1 0 0	0 0 0 0 w —

The ties of 10 were shot off with the following result :

	Double.	Single.
Arnold	0 0 * 0 11	1 1— 5
Edwards	0 0 0 1 0 0	1 1— 3

The first match on the boards for Saturday was the Visitors Match, resident members of the Riverton Club barred, entrance fee ten dollars, seven birds, handicap rise. The first prize, a bronze group, "The Lion and the Hunter," by Pallot, Paris, an original model, presented by the directors of the Riverton Club, and fifty per cent. of entrance fees, was won by Mr. Wallace, of the New York Gun Club. The second, a Turkish cutlass paperknife, silver and bronze and thirty per cent. of entrance fees, was won by Mr. Zinn, of the Philadelphia Gun Club. The third, a Holsteric barometer in brass frame and twenty per cent. of entrance money, was won by Mr. G. Carson, of the Philadelphia Club.

Following scores are appended :

Minto	28 yards	0 0 1 1 6 1 1	—
Wallace	28	1 1 1 0 1 1—1 0 1	—
Henry	28	0 * 0 w	—
Armstrong	29	0 1 0 0 w	—
Hammond	25	0 1 1 1 1—0	— 5
H Carson	29	1 0 1 0 w	—
Howard	26	0 0 1 1 0 0 w	—
C Lewis	24	0 0 1 0 9 1 w	—
Zinn	28	1 1 1 1 1 1—1 0 0— 8	
Jackson	27	0 0 1 1 1 0	— 4
Arthur	25	0 1 1 1 0 0 1	— 4
Bickley	28	0 1 1 1 0 0 1	— 4
Townsend	26	0 1 1 0 1 1 1	— 5
G Carson	28	1 0 1 0 1 1—1	— 6

The great event of the tournament was the Riverton Cup Match at twenty birds, thirty yards rise, class shooting. The first prize, the Riverton Cup and fifty dollars in money, was won by Mr. Minto, of the Staten Island Club. The second, a field gun, was won by Mr. Howard, of the New York Club; and the third, a hip-pocket flask of sterling silver and twenty-five dollars in money, was won by Mr. F. P. Sands, of the New York Club.

The following are the scores :

Edmunds		1 0 1 1 1 1 1 0 1 0 0 1 1—0	—14
Minto		0 1 0 0 1 1 0 1 1 1 1 1 1 1	—15
G C Carson		0 1 1 1 0 0 1 0 1 1 1 0 1 0 1—1 1 0	—16
Hammond		1 1 0 0 1 1 0 0 1 1 1 1 1 1 0	—11 1 0—17
B Meredith		0 1 0 1 1 1 1 0 1 0 1 1 1 1 1—1 0	—14
S Williams		0 0 0 0 1 0 1 1 1 0 0 1 1 0 1	— 9
Howard		0 0 1 1 1 0 1 1 1 1 1 1 1—1 0	—15
Wallace		0 1 0 1 0 1 0 0 1 1 1 1 0 1 0	— 9
Lewis		0 1 0 1 1 1 1 0 1 0 1 1 1 1 1	— 9
F P Sands		0 1 1 0 1 1 1 1 1 1 1 1 1 1 1	— 9
G R Crump		1 1 1 1 0 1 0 1 1 1 1 0 0 1 0	— 9
Burroughs		1 1 1 1 0 1 0 0 0 1 1 0 0 1 0	— 8
Jackson		0 1 1 0 1 0 0 0 1 1 0 1 1 1 1	— 9
Arnold		0 0 0 0 1 1 0 1 1 0 1 0 1 0 w	—
Townsend		1 1 1 0 1 0 1 1 1 0 1 0 1 1 0	— 9

This ended the meeting the honors being evenly divided all around. Gen. E. B. Grubb refereed the entire shoot, and gave universal satisfaction. All the gentlemen present complimented the Riverton Club on the excellent manner in which the tournament had been managed.

CONEY ISLAND, N. Y., March 25.—A large number of the members of the Red and Gun Club assembled at their shooting grounds here to-day for an afternoon's enjoyment. The principal event was shooting off the ties of the last monthly contest of said club, for a handsome silver napkin ring, between Mr. McLaughlin, Mr. Grace and Mr. Dixon, at three birds each. It resulted as follows:

McLaughlin at 21 yards	1 1 3	Dixon at 25 yards	1 1 0—2
Grace at 23 yards	1 1 0—2		

Mr. McLaughlin won the ring. Afterward a match took place between four gentlemen, 20 birds each, in which Mr. Jas. Shevlin astonished himself by killing 19 out of 20 birds at 21 yards.

A match took place at 5 birds between Mr. Grace and Captain Williams, at 23 yards each, both barrels. It resulted as follows:

Williams	1 1 1 0 1—4	Grace	1 0 0 1 1—3

Another match took place between Mr. Kerrigan, Mr. Delmar and Mr. Jas. Duane, at 3 birds each, 21 yards, which turned out as follows:

Delmar	1 1 0—2	Kerrigan	1 0 1—2
Duane	1 1 0—2		

NEWARK, N. J.—The last monthly shoot of the Essex Club showed scores as follows:

Pindell	1 1 1 1 1 1 1 1 1—10	Hayes	1 1 1 0 0 1 1 1 4 5—8
Hill	1 1 1 1 1 1 0 0 1—7	Belcher	1 1 1 1 0 0 1 1 0 1—7
Rembell	1 1 1 1 1 1 1 1 1—10	Palmer	1 0 0 1 1 0 1 0 1 0—5
Kinsey	1 1 1 0 1 0 0 0 1—5	Keeller	1 1 1 0 1 0 1 1 0 0—6
Pentz	0 1 0 1 0 1 1 0 0 1—5	Dumar	1 1 1 1 1 1 1 1 1 1—10
Bush	0 1 1 1 1 1 1 0 1—8	Watts	1 0 1 1 1 1 0 1 1 1—8
Jones	0 1 0 1 0 1 1 1 1—7	Bennett	0 1 1 1 1 1 1 1 1—9
Brown	1 1 1 1 1 1 1 1 1—10	Willergod	1 1 1 1 0 1 0 1 1 1—8

FORT MORRIS, N. Y., March 26.—The regular monthly glass-ball match of the Knickerbocker Gun Club took place to-day on the K. Y. C. grounds, at Port Morris. Fifteen-ball match, rotary trap, handicap rise. The following is the score:

F B Chedsey	25 yards	01111 11011 10111—12
S Chubb	18	10111 11101 01111—12
S C France	26	11110 11110 01110—11
G E Archer	25	11111 01111 11111—14
A Steinke	25	11111 01001 00111—10
W Potter, Jr	25	00110 10011 00111— 8
A A French	25	00101 10010 00111— 7

D. F. CAUGHLAN, Referee.

N. Y. GUN CLUB, March 26.—Seven members of the New York Gun Club were on the grounds of the club at Bergen Point to-day to engage in their favorite sport. The fixed event of the day was the contest for the Barron Trophy, but notice had been issued that owing to the Riverton Gun Club meeting the contest would not take place. Afterasome sweepstakes shooting it was claimed by several members that nothing in the conditions governing the contest for the Barron Trophy allowed or provided for any postponement and it was decided to shoot the contest, all present entering for it. The day was a fair one for the sport, the wind being slightly in favor of the birds, all of which were good, but the scores made were fully up to the average. In the preliminary sweepstakes, each at seven birds, Mr. H. Dexter carried off the stakes in the first and second on a score of six killed in each. In the third Dr. White and Mr. Dunleavy tied on five each, and in shooting off Mr. Dunleavy won by killing one out of two, Dr. White missing both.

WELLINGTON, Mass., March 25.—The Raymond club held its regular meet to-day, the attendance being very good, although the day was a poor one for glass-ball shooting, the wind blowing almost a gale during the contest. The first event of the day was a match at ten balls thrown from Cary's double rotary trap, with the following result:

F Raymond	8	J S Sawyer	6
W B Wilbur	8	J Francis	5
D W Locke	7	D Kirkwood	5
C Ellsworth	6		

The second match proved an exciting one and capital work was done considering the climatic changes. The conditions were twenty balls from the Cary rotary trap, eighteen yards rise. The results obtained were first class, as the summary indicates:

W B Witherell	20	A W Core	18
J S Sawyer	19	D W Locke	17
D W Locke	20	J C Morris	13
C Ellsworth	20	J Francis	13
F H Raymond	19	M L Smythe	12
D Kirkwood	19		

The result of the meeting was a team match between Captain Sawyer's and Witherell's teams of three, which resulted in a victory for the Sawyer team, who made a clean score of 29 balls each man, or a total of 60.

TORONTO, March 9.—The Toronto Gun Club had a shoot at snow birds to-day at Woodbine Park, and for many of the marksmen it was a novelty, being so different from pigeon-shooting. Mr. T. Taylor, a very good shot, was suffering from a broken ankle; in fact, the gun had to be carried to him and his crutches held till he shot, which will account for his bad score. It was plucky of him to attend the shoot. The names of the winners of prizes are William Kennedy, first; B. Pearsall, second; James Douglas, third. In tossing off for the fourth and fifth prizes, H. Watson won both. There was little or no wind.

W Villiers	21 yards	10011 01110 11—8	
R Mortimer	18	10110 11010 01—7	
J Young	20	01110 11001 10—7	
Dr W Smith	20	11011 11000 11—7	
A Mercer	18	00011 01101 00—5	
Wm Kennedy	21	11101 11100 11—8	
Thos Taylor	20	00100 00001 10—3	
J Evans	18	01110 00101 11—7	
J James	21	11011 01100 11—8	
A McGregor	20	11011 10000 10—5	
A Beatty	18	10100 00000 11—4	
B Pearsall	20	11111 11110 00—9	
J Leslie, Jr	18	10000 00111 00—4	
S Standland	20	10000 11111 11—8	
A Purse	18	00110 01000 11—6	
J Douglas	20	11100 11011 11—9	
H Watson	21	**111 01111 10—8	

Ties of 9.

W Kennedy, 24 yards	1 1 0 1 —3	J Douglas, 25 yards	0 0 1 0—1
B Pearsall, 23	0 0 1 0 1—2		

Ties of 8.

W Villiers, 26 yards	1 0 1 0 6—2	J James, 26 yards	1 0 0 0 1—2
S Standland, 25	1 0 1 0 0—2	H Watson, 26	1 0 0 1 0—2

Darkness being on, these last four tossed up for fourth and fifth prizes.

LONDON, ENG.—*March* 22.—Dr. Carver, Mr. Scott and Mr. Reeves Smith, manager of the Brighton Aquarium, have entered into the following agreement to-day: Mr. Smith gives a prize of £2,000 to be shot for under the following conditions: Carver and Scott are to shoot at thirty contests, 30,000 glass balls, in as towns of Great Britain Smith may select, the thirty contests to be concluded within two months from the date of the first one. The winner is to receive £1,500 and the loser £500. Smith will supply the glass balls and cartridges and Carver and Scott the guns, traps and assistants.

The Long Island Association will hold a meeting at the Royal Arcannum Room Music Hall, Brooklyn, on Friday evening, April 1, at eight P. M.

A NEW CUTTER.

DRISCOLL, of Greenpoint, has commenced work on a fine new cutter for Dr. B. F. Dawson, the lines being furnished by Mr. A. Cary Smith. It is quite amusing to see the old type of Bourbons trying to find courage into the sticklers for racing machines by "talking down" and "writing down" what they flippantly assume to constitute a cutter, utterly oblivious of the whole fleet of such boats now building, their growing popularity and the gradual conformity of even the new sloops to the sound principles upon which the design of the cutter rests. To maintain that a cutter is necessarily "a plank set on edge," excessively narrow, crank and deep, is childish nonsense and stupid pettifogging, by which facts are sought to be discounted and the truth perverted. There is a great deal of nonsense written against cutters by men who ought to know better. Call a beamy ship of moderate draft, excellent accommodations, great stability and good all-round qualities and handy rig a cutter, and a howl is at once raised by the ever faithful. Then again call a fast and handy centerboarder, less accommodations, greater cranki-ness, poor qualities except in smooth water and unhandy rig a sloop, and things are once more lovely, the patriot points to her with pride, and from the pens of soundry esteemed contemporaries the ink flows freely in unctuous platitudes. Why men who ought to know may possess all a yachtsman in America esteems to a higher degree than the second. But the name of the thing condemns her! One is dubbed a cutter, the other a sloop, by common consent, without particular rhyme or reason. Yet the first may be really more of a sloop and the second more nearly a cutter, according to the slipshod reasoning and false standard set up by the superficial and half reasoning we are now taking to task. There seems plenty of room for the display of a little more common sense on the subject, and perhaps these lines will help to check the overflow from many well-meaning but misinformed persons who are sorely grieved lest we all get astride of planks set on edge. The *principles* underlying the design of a cutter are simply these:

Fair beam.
Fair draft.
Easy form.
Easy bilge.
Uncapsizability.
All-round qualities.
Roominess in all directions.
Handy rig.
Moderate draft.
A sailor's outfit.

Now, we should like to know how any person of average sense can lash himself to any one type of which those above form the main characteristics. A yacht possessing the qualities indicated is a craft which will recommend herself to the sailor, to the traveler, to the family, and to that portion of the public in general which does not know the head to be turned by the empty sound of a mere name. That excessively narrow and crank cutters have been built for prize winning in British waters under the farcical tonnage rule in vogue up to a very recent date is quite true. Out of a fleet of 3,500 yachts, a couple of hundred at most belong to the narrow type so harrowing to the soul of the yachtsman who yearns after "comfort," and whose main conception of a successful yacht is to make her as much like a hotel ashore as he can. But why brand 3,300 beamy yachts as "cranky trads" because of the sins of 200, when the 3,300 are known to be safe and able beyond reasonable requirements, while an average quite as stiff as our sloop? We do not expect every one to take to our views kindly at first, or even at all, but the silly, meaningless cry of "crank" and "deep-draft" cutters has no application in point of fact, and we certainly can see no reason for such nonsense and a slight regard for the truth from any one venturing to express a decided opinion one way or the other. The long and short of the whole matter is that to judge cutters as a class by a single narrow racing machine, built to swindle an asinine measurement rule, is just about as sensible as to judge our American yachts by a fourteen-foot brick sloop. They may all be cutters just as they are all sloops, but there is a difference for all that which ought not to escape the notice of any person claiming to be more than the merest tyro at the whole business. Stability is obtained by beam, by weight, by ballast, by keel with ballast thereon in place of a centreboard, and it is easy to understand that with less beam equal stability may be obtained at anything but initial angles—and in practice the latter need receive no consideration, for greater stability than that given by a "begin to talk," combining thereby all the comfort a consumptive hospital patient could ask for, in addition to the very satisfactory feature of safety in a squall or tripping sea and ease in rough water. Give such a boat a single stick and double headsail and she is in principle a cutter, as far as your design is good; stiff, dry, able, weather-driving less water than with a board, and less than the excessively beamy keel sloops of the modern style; comfortable because of ample beam for her length or tonnage, and of good depth as well; a fine ship in a sea way, and that will take you where you want to go and not have to square away for port at every thunder cloud on the horizon; easy to work and easy to steer, and easy to hand; cheap to build and cheap to sail. That is the cutter as she is seen in her true colors, not warped and distorted by silly fanaticism or the want of common sense and the wild, untamed imagination of romancers with the pen, who may never have seen other than one or two faulty copies in home waters. Compared to the cutter in the purity of her design, the dull bottom light draft is the merest machine—a makeshift, a misery toy the man with a sailor's instinct views with compassion if not contempt—a fair-weather butterfly and nothing more. And the yachting public is finding it out as well. We are all building deeper and splitting jibs; a dozen keels are launched to every board; ballast hangs outside; topmasts bouse; step by step we are learning by experience, faster often than our thoughts will follow. Some swim with the tide and others buck against it for a while, but all go down to the sea in the end. We are building cutters without "getting astride of planks set on edge." We are building sensible cutters, boats far preferable to the shingle bottoms, a fair mean between the two extremes exemplified by the English "planks" and the American smooth-water machines. As we rise in the mastery of seamanship, so will we become more kindly to the seaman's craft. But there will always be a fraction who never get beyond the first stages, and who will never learn to esteem the sport in a higher light than that of a big gamble for prizes. The public is probably surprised by this time with the "discussion" of a subject first started by FOREST AND STREAM, but which still furnishes others with a bone to worry on, and we are prepared to abide by the results of future experience. The cutter has been fairly launched in American waters. Those who have built once, we notice, always build them again. Sloopmen may become cutter-men, but those who have not tried the birth of coaxing up a keel with only the little finger on the helm, never- hardy ever—go back to gymnastics at a wheel. But if the cutter question is life or death to our friends on the press, let us ask from them just a little common sense and a sprinkling of the truth in place of romance and fairy tales. The "plank-on-edge" nonsense, the "deep-draft" vagary, the "great-co-t" bugbear and similar cant, ought surely by this time to be thoroughly "played out." Let our friends bear in mind that there are cutters and cutters, and if they do not believe it, look at the lines of the new crop of yachts all down the east, and don't go off half-cocked because they have caricatures of the cutter abroad as we have extravagances of our own sloops at home. Dr. Dawson's new yacht promises to come very near to the principles of design above enunciated in these columns, and we hope in due season she will be fast depends of course upon her individual design and how she is put through by her future skipper. She is to be 54½ ft. over all, 46½ ft. water line, 15 ft. beam; draft, 6 ft. 3 in. She is to have a small board, but this we think will be discarded after a year's trial. Ballast will be 14 tons of lead, of which 6.8s tons will be on the keel. Double headsail of course. No one thinks of a single jib on a boat of any size nowadays. The single jib has been about buried with a lot of other vagaries of the olden times. Mast, deck to cap, 46 ft.; masthead, 9½ ft.; topmast, heel to truck, 32 ft.; boom, 46 ft.; gaff, 30 ft.; bowsprit outboard, 24½ ft. The yacht could have been flush-decked, but Dr. Dawson preferred a small "house," 14 in. high, giving a wide floor and 6 ft. 5 in. head room.

A CRUISE AROUND CAPE COD.

OUR yacht is an able centreboard cabin sloop—25 ft. long over all, 10 ft. beam, and draws 3 ft. water without the board. She is rather heavily sparred for comfortable cruising, unless there is a full crew to handle her sails, which are large enough for racing. In this cockatoo lines were four of us, and being well used to the boat and to each other, and accustomed to doing all the work on board, including cooking, we looked forward to three weeks of rare sport. We had sailed many a race together, and several times had cruised in company, both around the cape, and along the coast of Maine, so that we had no misgivings regarding our social relations, a very important point in a cruise where so much depends on everything going smoothly. The leave of absence of one of our party being limited to ten days, we were anxious to get as far on our return trip as possible before he was obliged to leave us. So we decided to take the first night outside, although we intended after that to sail only by day-light. The boat had been hauled out for a little cleaning and brushing up generally, and everything was put on board and stowed away while she was afloat the day before, and when she was launched at high water we had only to put a few traps on board, get underway, and take advantage of the ebb tide out of Boston harbor.

Saturday, July 10, at 4 A. M., we cast off from the float stage and stood out on the port tack, with a light easterly wind just filling the topsail. When in the strength of the tide we were almost up with Long Island we could just lay out through Broad Sound, and decided to do so instead of heading through the Narrows, as we could not lose much, and could take advantage of a long reach in smooth water to get supper. At 7 o'clock, when we went about outside the shoals, we could just lay our course S. E., which would take us to Highland Light. A twenty-ton cutter, which had left the Point soon after us, was seen a mile to windward, having gone out by way of the Narrows, and like ourselves bound to Provincetown. She was soon walking by us hand over hand, with the wind a trifle southerly. At 9.30 we had Minot's abeam half a mile to leeward, and were again laying our course. The fog now shut down very thick and wet, making it impossible to see a length ahead. As we were directly in the line of travel between Boston and the cape we were naturally anxious regarding steamers, but thought we ran no more risk by pushing along on our course than by crossing their course and trying to get outside them. A sharp lookout was kept, but not a whistle nor a sound of any kind outside our own boat greeted our ears during the night. As the fog continued all night as thick as it could be made, and in addition we had now and then a smart shower, and fifteen minutes or half an hour of dead calm. Sometimes the wind headed us off the course a point or two, and then would fall away as much, so that we judged we should make pretty good. At daybreak a fog horn was heard on the weather bow, but not distinctly enough to count the blasts. We kept on for half an hour, and going about soon heard it again dead ahead, and recognized it as Race Point, kept on our course for an hour or so, and the fog lifted enough to show us the shore five miles south of Race Point. In a bend in the beach nearer the Point several vessels were seen at anchor. At 8 o'clock close-hauled on the starboard tack with the wind fair, and all we wanted with the topsail set. At 10 o'clock, wind S., and freshening so that we had to stow the topsail. Although we seemed to make slow progress against the chop kicked up by the wind, we noticed that we gained rapidly on everything in sight. At 12:15 the wind blew straight along the beach and gave us no advantage on either tack. The sea was now getting rather inconvenient for us, and it was soon evident that a single reef at least was needed in the mainsail. As with less sail we could not hope to get farther than Chatham Bars by dark, and it was sure to come in thick again as soon as the sun went down, we decided to put in there. At 3 o'clock the sky was clear of fog in our vicinity and the wind hauling to westward. Turned in after reefing the mainsail and getting the storm-jib ready in case of emergency. At 11 o'clock the watch called us, and we found the stars shining brightly and a fine breeze blowing N. W. We got under way at once with the short sail, which kept the boat on an even keel and allowed all but the man at the wheel to sleep comfortably. At 2:15, off Nauset beacons, gave her the main jib and raced under the startle sky, the breeze coming over the short sea which we had met under the influence of the southerly current, and filling the hollows, while the chirp of crickets and the occasional call of a sandpiper were the only sounds, save the soft lapping of water along the sides and old J. snoring in the cabin. At the very peep of day we set the whole mainsail to the boom on Chatham Bar, and ran down to Monomoy in just an hour. But the wind was freshening and gave us all we could stagger under, and, seeing the coasters off the Shovelful shortening sail, we hauled in near the beach and kept down about three miles from the land, intending, as we had all day before us, to beat through the sound to Vineyard Haven. When we got out past the Shovelful, however, and felt the full force of the short, deep sea, Vineyard Haven seemed too far off to windward, and too far away for Nantucket. The tide running so hard to windward enabled us to carry the boom well off the port quarter, and more headsail was desirable. So the bobbed jib was stowed in order to get the halliards for the storm-jib, and it was no easy thing to do, the sea being so short and deep that the bowsprit went two feet under in every sea, and the fore deck was flooded. Several times while stowing the jib the man on the bowsprit was lifted high above the trough of the sea, apparently ten feet, and in the same instant sousced down into it above his ears much to our consternation, for had he fallen overboard we could have done precious little to save him. He was a cool hand though, and the storm-jib was soon pulling us along in fine style in spite of the sea. The wind had all the while been getting stronger, and all but the largest vessels in sight were under storm-sail. This is one of the times when we have wished for a cutter rig, but my boat is hardly large enough, and we think, upon the whole, the sloop rig best for her. At 8 o'clock A. M. we were anchored in Nantucket harbor, our friend the cutter bringing up at Oak Bluffs four hours, having passed Monomoy only a short time before us. The wind continued fresh all day and night, moderating at noon on Tuesday, when it moderated and backed to southward. We got underway at 3 o'clock, and outside the harbor had a whole sail breeze until up with Cape Pogue, when it died down to a gentle evening zephyr which panted us slowly across to Oak Bluffs, where we anchored at 9 o'clock. At 7 next morning we were underway and beating slowly through the sound with a light S. W. wind; went through Quick's Hole at 10 o'clock. At 1 o'clock, off Old Cock Spindle, close hauled on the starboard tack, the wind fair, and gave the jib topsail was sent aloft, but was no sooner sheeted home than the topsail carried away at the sheave hole, letting the sail into the water. The gaff topsail remained standing, enough of the topmast being left above the hounds to hold the halliards. It was taken in, the topmast sent on deck, and the signal hoisted for a tug to come ahead. We could just lay the course for Brenton's reef, but when nearly up with the buoy the wind headed us so as to make a short hitch necessary. Came to anchor in Newport harbor at 6:30 near the cutter which had come in in the morning. At noon Thursday got underway and beat down to Bristol, where we anchored off Herreshoff's wharf and had the topmast repaired. When we turned in that night the wind was blowing fresh S. W., and being on a lee shore the big anchor was dropped under foot, although we had no idea of dragging. The next day the S. W. wind increased to a gale and blew the hardest of the season. We rode bowsprit under for twenty-four hours, but this did not interfere with meals, and we were quite comfortable below. The small anchor had been holding perfectly all night, and about noon the cable parted from chating on the bottom, and he fetched up on the big anchor, which was, luckily, already on the bottom, otherwise we should have gone ashore on the rocks before we could have got it over. Sunday morning got underway with a fine run down to Newport, where we anchored at 6 o'clock. Sunday at 10 o'clock, a cutter, underway, intending to run over to Block Island, but when outside the harbor the wind drew ahead and we bore away for New Bedford with the ballooner pulling like a horse. Brought up off the club house at 5 o'clock. Got underway Monday at 10 for a run to bay with a fine S. W. breeze. In trying to get into the basin behind Toby's Island we ran aground and had to wait for flood tide. By the time we had finished dinner, 4 o'clock, we were afloat again and soon beating down the bay, intending to bring up for the night at Quisset harbor, but when we arrived off the village it was too dark to go in and we dropped anchor outside and turned in. The next morning a man hailed us and asked if we wanted to go in, to which we answered no, but before noon accepted having been driven in by a fine S. E. and raining when we got underway for Edgartown and ran along the Naushon shore with all sail. At 7 o'clock we had two reefs down. At 8 went through Quick's Hole, and when hauling on the wind for Lone Rock got a heavy puff from N. W. that knocked us flat and showed plainly that it would be useless to try to beat through the sound against the tide, and we ran back into the Hole and anchored in a small bend in the N. W. shore of Pasque Island, getting as near the beach as seemed safe, in order to make the most of the scant room. It had not been fifteen minutes since we had passed the point, but the wind had increased to a gale and made us glad of even so little shelter. Both anchors were carried out in the tender toward the shore and spread N. and S. to hold against the tide running either way. There was no sea where we had anchored, although at a very short distance from us it was very rough, and it seemed as if we could not have held on in any place but where we were fortunate enough to anchor. A heavy swell hove in from the bay which rolled the boat down to the gunwale, and made it lively for the man who tried to sleep on the transom. The gale continued all day and night, and we were told afterward that it was the heaviest northeaster ever known in July. At 7 o'clock Wednesday morning the wind was still N. E. but moderating, although still blowing hard, and we got under way with close-reefed mainsail and bobbed jib. This sail was not sufficient, and a reef was shaken out of the mainsail and the storm jib set. With this sail we worked by short hitches in the smooth water along the Naushon shore until well up with the N. E. end of the island, which gave us a good stand across, when we set the main jib and ran for Edgartown. We found it very rough off the East Chop, and the wind freshened so that we had all we wanted. The anchor

was dropped in Edgartown harbor at 4 o'clock. One of the party left the boat here, his time having expired, and there were three of us to Chatham, after that four again. Thursday the weather was very unpromising and we remained at anchor. At sunset the sky looked threatening, and at 11 o'clock we had to turn out and get the big anchor over. Friday morning broke bright and pleasant but with no wind. At 10 o'clock we got our anchor and drifted out of the harbor. When off Cape Pogue got a good breeze S. W. which held all day, enabling us to carry gaff topsail and studding sail until up with the Handkerchief, when it got too fresh for kites. We came to anchor in Stage Harbor, Chatham, at 3 o'clock, making the run of 50 miles in just five hours.

We remained at Chatham until Wednesday, Aug. 7, when we got under way and crossed the bay at 7 A. M. with a light S. W. breeze, which soon hauled N. W. and blew pretty fresh, but after awhile settled down to a good whole sail breeze which took us nearly to Highland Light, where we lost the wind for an hour or so, when we got it fresh from the S. W. and ran nearly to Race Point, where we had to lower away everything and anchor for a sharp N. W. thunder squall, which soon passed, leaving a chopping sea and little wind, and it was nearly 9 o'clock before we let go our anchor in Provincetown harbor. Next forenoon saw us standing out past Long Point, heading for Barnstable with the wind still N. W. It was not long however before it headed us, and came light and baffling until 3 o'clock, when we had it steady from S. W. and took in the topsail and beat into Barnstable, anchoring off the old wharf at 6 o'clock. Although we had more than ten feet of water under us, we knew we should be high and dry when the tide went out, and to keep the boat on an even keel she was hauled alongside the wharf and grounded on a smooth bit of sandy bottom and listed toward the wharf, thus allowing us to sleep in comfort. In order to lie afloat in this harbor you have to anchor down near the lighthouse. But we had to coninundate with the village and so went up into the creek. During the night we were awakened by a most terrific thunder shower, which lasted an hour or more, the thunder and lightning being almost continuous and the rain falling in a deluge. In the morning we found that no allowance had been made for the extra rise of the night tide, which was at its height when we went on the sand, and the morning flood did not come within six inches of the water line, so we had to await another night tide to take us off, and then it was too late to get under way, so hauling off to the end of the wharf, where we would be sure to float in the morning, we turned in. At 9:30 Saturday morning we got under way with a piping S. W. breeze, which made a fine show of "white horses" in the bay. The tender was got on deck and things made snug for a run to Marblehead, where we dropped anchor at the head of the harbor just as the sun went down, making a run of about sixty miles in less than ten hours, which we were well pleased with, especially as we were diverted from our course by the threatening appearance of the sky to windward, which made it appear desirable to keep well in toward the land all the way from Plymouth to Scituate. Sunday we beat home against a light S. W. breeze, picking up our moorings at City Point at 5 P. M., and thus ending our delightful three weeks' cruise.

MONOMOY.

YACHTING NEWS.

ROYAL NOVA SCOTIA YACHT SQUADRON.—Upon the retirement of F. C. Sumichrast, Esq., Hon. Secretary of the Squadron ever since its foundation, the following well-deserved compliment was paid to an officer whose untiring work and well-directed zeal has done so much to promote the sport in the Maritime Provinces and to build up the R. N. S. Y. S. to its present flourishing condition. Mr. Butler proposed and Mr. Hedley seconded the following resolution, which was unanimously passed:

Whereas, The office of Secretary in an organization of this kind is of much importance, as that on whom the due discharge of the duties of that office depends in a great measure the prosperity and permanency of the Squadron; the voluntary retirement of our late Hon. Secretary from that position requires that we should acknowledge in a suitable manner our appreciation of the services rendered by him; therefore

Resolved, That we tender to F. C. Sumichrast, Esq., our late Honorary Secretary, the thanks of this Squadron for prompt and faithful discharge of the duties of that office from the formation of the Squadron to the choice of his successor.

To this resolution the club has received with gratification the assurance of continued interest in the Squadron's welfare in this reply to the newly-elected Secretary, Mr. A. C. Edwards:

I beg you will convey to Vice-Commodore Carter, Rear-Commodore West and the members my thanks for this expression of good will, which has much gratified me. I need not say that, although no longer occupying the responsible and onerous office to which you have succeeded, the experience I have acquired therein will always be at the service of the officers and members of the Squadron, to whose success I have devoted myself in the past and whose welfare it will be my privilege to continue to work for as a private member.

Yours, very sincerely, F. C. SUMICHRAST.

IN THREE WEEKS.—We print this week an entire page of yachting and canoeing advertising of more than all our esteemed contemporaries combined, daily and weekly, lay and professional. The trade and the public are learning to appreciate the value of a journal which offers the largest circulation among the classes they wish to reach. We have a letter before us from an advertiser who in three weeks has received nine hundred and ninety-eight letters, including one from Gaboon, West Africa.

OFF FOR A CRUISE.—Com. C. E. Chase has left this city for an extensive canoeing cruise in his canoe Racine. He will take water at Olean, N. Y., run down the Alleghany and Ohio to Cairo, then up the Mississippi and Rock River to Pewaukee; thence by rail to Milwaukee; by steamer across Lake Michigan; then canoe it across the State of Michigan, again take Steamer to Kingston, and paddle down the St. Lawrence, through the Richelieu into Lake Champlain, finally down the Hudson to New York again.

CAMILLE.—This cutter is now in the hands of Kirk, of Chester, for general overhaul, preparatory to an extensive cruise. She has an iron keel. Gunning skiffs are also being overhauled by the same party for an active campaign on the Delaware.

THE YANKEE.—We take the following from our French contemporary *Le Yacht* anent the yacht imported by Mr. Verbrugghe, an active member of the *Cercle de la voile de Paris*: Length over all, 28 ft.; on water line, 23ft. 4in.; 10ft. 3in. beam; 2ft. 5in. deep, built for smooth water racing. Spars, mast, deck to hounds, 34ft.; diameter at deck, 9in.; bowsprit outboard, 21ft.; gaff, 17½ ft.; boom, 34ft.; carries about 740 square yards of canvas, of which one-third is in the jib. She looks handsome. The bow is fine, with an easy hollow; the midship section three-fifths from forward; the stern wide, but well cut up; a little hard, but of excellent bearings. She is to be sailed on the American plan with shifting ballast, but *Le Yacht* does not feel certain that the plan will work well on the Seine river, where short tacks are necessary. It was in 1853 that a boat also built by Kirby was first imported into France and from her model the present French style has been evolved. It will be interesting to observe how these boats compare with this new importation from America nearly thirty years later.

DRAGS.—*Editor Forest and Stream:* Speaking about drags in your last issue, let me give you an item of my experience in sailing a small half-decked yacht on Lake Ontario. I carried a drag made of an iron ring seven inches in diameter, to which a canvas bag four feet long, running to a point, was fastened. The only use made of it was in reefing, when I found that with 30 feet of line paid out it held the boat to the wind splendidly. I have an idea I could ride out a squall or gale with it.—ONTARIO.

VESTA.—This fine, wholesome schooner, one of our few big ones with honest displacement, has been purchased by Mr. F. F. Ayer, of Lowell, Mass. She is to be coppered and overhauled before going East. One by one our best yachts are taking up moorings to the north of Cape Cod and nothing is building to replace them. Why is this? The Vesta only wants a keel to make her one of the best cruisers in America. She is 110 ft. over all, 98.75 ft. on load line, 24.8 ft. beam, 8.6 ft. hold, and 7½ ft. draft without board.

JUNIATA has been bought by Mr. H. Bartals of Philadelphia. She is 80 ft. long, 19 ft. beam and 6½ ft. water without board. In spite of being comparatively narrow she led all the famous beamy shingle bottoms a lively dance during the cruise of the N. Y. Y. C. last year, showing that we have made little or no improvement in speed for a quarter of a century, and effectually belieing the notion that all beam and next to no draft with towering spars is the secret of success. She is to cruise in the West Indies this year.

EAST RIVER YACHT CLUB.—The spring cruise has been fixed for May 22, and the annual regatta for June 6. Time allowance, two minutes to the foot of length. Course from Pottery Reach, Greenpoint, around Gangway buoy and return, finishing off Hunt's dock, opposite Flushing Bay; distance 20 miles. The club proposes to build a new house in April, 35x22 ft., two stories high, to cost about $1,000.

NORTHUMBRIA. This fine English steam yacht has been lying in the Hudson off Hoboken. Her owner, the Earl of Lonsdale, will return to Europe by mail steamer, the yacht following. She is 145 ft. long, 25½ ft. beam and 13 ft. deep, rigged as a three-masted schooner, and carries a crew of 26 hands all told. Speed under steam, 9 knots. She has made twelve under sail and steam both.

EMPIRE YACHT CLUB.—Officers for the year: Commodore, Harry Hill; Vice-Commodore, Daniel Urias; Rear-Commodore, John S. Meinut; President, William O. Davis; Secretary, George Young; Treasurer, John Flanell; Measurer, Andrew J. Brush. Regatta Committee—Richard Cullen, John O'Brien, Merrit Hussey, Joseph Northrup, Dennis Sullivan; Steward, William H. Borst.

LYNN YACHT CLUB.—Officers for the year: Commodore, E. C. Neal; Vice-Commodore, E. G. Souther; Fleet Captain, J. F. Lee; Secretary, E. M. Frazier; Treasurer, C. H. Clifford; Measurer, C. B. Taylor; Trustees, G. B. Chase, G. H. Cushman, Otis Atwood, Regatta Committee, C. H. Clifford, G. S. Littlefield, J. W. Haines, William Low, Warren Martin.

EASTERN YACHT CLUB.—As intimated in these columns, the E. Y. C. has declined the invitation to meet the N. Y. Y. C. in our harbor, but will make the passage around Cape Cod in squadron and sail in company in the Sound, should the N. Y. Y. C. undertake its customary annual cruise.

SOUTHWARK YACHT CLUB.—Officers for the year: Commodore, F. A. A. George; Vice-Commodore, G. Barnes, Jr.; Rear Commodore, W. H. Clymer; Treasurer, Isaac Sharp; Measurer, W. Malsam; Secretary, Jas. Winterbottom. Annual regatta fixed for May 23.

NEW RIVETONNER.—Mr. McCorkell, of Kingston, N. Y., has built a handsome little five-tonner 30 ft. on deck, 25 ft. on L. W. L., with keel and iron shoe. She is smooth built below water and clinker above; very light, but strong in hull, and is to show good speed.

COIL BOILERS.—Parties in this city have built a launch with a coil boiler and forced circulation. We would advise them to be careful lest they infringe certain patents, in which case they are likely to get themselves into trouble.

LOTTIE.—Col. Duryea of Brooklyn has bought the sloop Lottie from Mr. Sheldon, and will hoist the colors of the Atlantic Y. C. The Lottie is 73 ft. on deck, 17 ft. beam and 6 ft. draft, and was built in 1874 by Soule, of Bristol, R. I.

SAPPHO.—This schooner will not race at Nice as expected, but is to go to Australia. She will hereafter be her sailing port, as it is intended to enter her in all the Channel and international matches in English waters.

IRON KEELS.—The sloop Lizzie Warner, of Boston, is receiving an iron shoe of 700 lbs., and the New York sloop Rover will have one of three tons on lead put on by Cash, of Northport, L. I.

FRENCH YACHTING FLAG.—Hereafter French yachts will subw special colors in the shape of a white flag with a tri-color field of blue, white and red vertical bars in the corner.

PHILADELPHIA YACHT CLUB.—Mr. Jas. Brett has purchased the sloop Juniata from Eastern parties. She is 35 ft. long, 14 ft. beam and 4 ft. draft without board.

RESTLESS.—The Restless, recently flagship of the N. Y. Y. C., has been bought by Mr. J. H. Humphrey, and is to receive an overhauling for a cruise to Europe.

ALERT.—This well-known New York sloop has become the property of Mr. Eaton and others of Boston. She is 41 ft. over all, 14 ft. beam and 4 ft. draft.

THE TWO TONNER.—*Editor Forest and Stream:* Your design for two tonner seems about perfect for our lakes. May build one for myself. B.

AMERICA.—This schooner was at Nassau, March 13, and sailed March 26 from Havana for St. Augustine, Fla.

MORE KEELS.—Sloop Cherub, Nautilus, Y. C., of Salem, Mr. Jos Allen, is to receive a 150. keel. Sensible.

GOLD.—The schooner Ionian, Mr. Wasson, Boston, has been altered to a yawl.

A timely use of Hop Bitters will keep a whole family in robust health a year with but little cost.

Answers to Correspondents

☞ **No Notice taken of Anonymous Communications.**

R. S. M., S. B., and CONSTANT READER are requested to send their names to this office.

JOHN PRESTON EDGAR.—Your communication was received. Will you kindly send name and address?

FLUSHING is requested to send his name to this office. Attention is called to the notice at the head of this column.

C. A. P., Guelph, Canada.—For articles on dog breaking see issues of FOREST AND STREAM of March 18, April 8, 15, 29 and May 13.

L. T., New York City.—When do you intend to issue FOREST AND STREAM Bird Notes? Ans. The book is now in the printer's hands and will appear shortly. Due notice of its publication will be given.

W. J. L., Attleboro, Mass.—Our reply to your question about map of St. John's River and east and west branches of the Penobscot does injustice to Messrs. Farrar & Hubbard, whose maps cover the region about which you asked. We can furnish them.

MERWIN, Geneva, N. Y.—1. Will it improve the shooting of a gun to pour tallow or oil upon the shot when you put it in the shell? 2. Also, if it would hurt a choke-bore to use a ball the same size as the bore of the gun? Ans. 1. No. 2. Yes. We are glad to hear from you even if you are an S. B.

N. S. M., Rutland.—In your answer to F. B., in your last issue, you say you can furnish maps of the Adirondacks. By whom are the maps published, and are they better or on a larger plan than the one issued by Stoddard in his guide book? Ans. By S. R. Stoddard, Glen's Falls, N. Y. In size they are 23½x28¾ inches.

C. B., Niagara Falls.—Where can I get wild pigeons, or where are they trapped this time of the year. I want to get a few hundred for my taxidermist. I would like the address of parties that trap them in order to get all perfect male birds. Ans. Write to T. Stagg, care Foss Bros., 43 South Clark street, Chicago, Ill.

W. H. C., Hudson, N. Y.—1. Do well-bred fox terriers ever have dew claws on their hind legs? 2. Is it important that the tail of a fox terrier should be docked for exhibition? Ans. 1. There should be no dew claws behind. 2 No. Although the tails of fox terriers are generally docked there is no rule to disqualify one with his tail *au naturel*.

W. L., New York.—I can spare but a day at a time. Where can I get the most sport in that day fishing, salt water preferred? Ans. Good salt water fishing can be had in May and June at Sheepshead Bay, but below Coney Island; at Sandy Hook or at many points on the L. I. R. R. by engaging boats ahead; also in Newark Bay. Take C. R. R. of N. J., foot of Liberty street, and go to Elizabethport.

GYGES, Montreal.—Can you kindly tell me name and address of manufacturer of jack lamps, dash lamps, etc., so much praised in your columns by an officer of the U. S. army? He said they were used by the transport department of the army and much approved of for their powerful light. I have looked over back files of FOREST AND STREAM, but cannot find article I want. It is not Ferguson, your present advertiser. Ans. What you want is probably the Boudren jack. Address White Manufacturing Co., Bridgeport, Conn.

R. J. H., Hart's Falls, N. Y.—What are the woods called Greenheart and Bethabara, and which is the most desirable for a bass rod? Ans. Both are foreign woods. The former is a greenish-looking wood much in favor in England, but not generally liked here. It comes from Demerara. The latter we don't know anything about except that it comes from Africa. We have never seen it. If it beats ash and lancewood rod it must be good. We have written to Shipley & Co. who advertise in our columns but received no information.

S. R. H., Plainfield, N. J.—1. What would be the probable cost of sending a dozen quail from Gainesville, Fla., by boat? 2. What would be the probable cost of sending the same by rail? 3. Which do you think is the safest? 4. Do they charge by weight or bulk? Ans. 1. The best way to send them by boat would be to put them in charge of the steward and pay him for his trouble. 2. If between 17 and 20 lbs. weight, would cost $4. If from 21 to 30 lbs. would cost $6.50. 3. By rail. 4. By weight.

A. C. E., Fernandina, Fla.—Have you among your books "Key to North American Birds," by Dr. Elliott Coues, or could you put me in the way of getting a second-hand one? I also want to get a case of instruments for taxidermical purposes. Where can I get them most handily? Those I have been using I brought from Europe, and they are worn out and broken. If you know any one who would like to have a fine specimen of a bald eagle (*Haliætus leucocephalus*), I have one stuffed—7 feet 4 inches spread of wings—that I would exchange for the above book and a case of instruments. The body is wood, and can be easily transported from here. Ans. We can furnish the book. The instruments you can get of any dealer in surgical instruments.

—Any subscriber or reader of FOREST AND STREAM in want of any kind of carpetings, oil cloths, rugs, etc., etc., can be sure of fairtreatment at the hands of John H. Pray, Sons & Co., Boston. Call or correspond with them, and get their prices before buying. It will pay you to try them.—[*Ade.*

STONEHENGE ON THE DOG.

Price $3 50.

For sale by Forest and Stream Publishing Co.

The Kennel.

FOR SALE.—THE BLUE STAR COCKER SPANIEL BREEDING KENNEL.—I will sell reasonably, owing to poor health and increase of private business cares, which will call for all the spare time I care to give in the future, and also enable me to complete my unfinished work on breeding, breaking and management of Spaniels for American Sportsmen. Therefore I offer as above my Kennel stock, all accessories, together with Kennel name and good-will, to any one having the taste and competent to carry on the good work well. The demand for this breed is immense. Over five hundred pups would have been sold last year (1880) from this Kennel had we had them. My price, $4000, is extremely low, considering its well established reputation and lucrative facilities. I will give all time and advice required, gratis, to the successor. One having breeding experience is preferred, and would like to hand over before June next. Only parties meaning business need apply. M. P. MCKOON, Proprietor, The Blue Star Kennel, Franklin, Del. Co., N. Y. Mar10,tf

THE FASHION KENNELS offer for sale or exchange the following stock: Rivet, fox terrier dog, 13 months old, white with even black-and-tan head, bred by Wormsley of Liverpool; he is by Forger out of Fanny; price $25. Little Dorrit, wire-haired fox terrier bitch, white with black-and-tan mark on head, 13 months old, bred by C. Burgess, Lincolnshire England; price $20. Carlo Kirke, liver-and-white cocker dog, 9 months old, by Whitman's Carlo, out of Ello Kirke; price $20. Luke Schoolcraft, bull terrier, white with brindle mark on head, body and tail; good on all points; kind, and fit to win on the bench; price $20. Carlo, liver, white-and-tan setter; said to be trained; two years old, and very fond of gun; price $20. I will exchange any of the above stock for fine black, black and tan, or red and white cocker spaniel bitches, or one stud dog. The above stock has each a full pedigree except the setter, and his sire only is known. Address J. H. WINSLOW, P. O. Box 472, Baltimore, Md. Mar24,2t

FOR SALE—Red Irish Setter Dog, Imp. Grinsa, by Moore's Rufus ex Twiggy's Kate, 2nd prize, Dublin, 1877; Rufus, by Palmerston ex The Queen; Kate, by Patsy (a Palmerston) ex Moore's Flora, dam of Mina and several other champion and prize bitches. Grinsa won 2nd open class and V.H.C. champion class, Baltimore, 1878, when but 12 mos. old. Only time ever shown.

Red Irish Setter Bitch Rosina by Imp. Grinsa ex Imp. Bella; Bella, by Dr. Boyd's Patsy ex C. Moore's Bell; Bell, by C. Moore's Old Shot (father of Palmerston) ex Old Kate. Both the above dogs were thoroughly broken by Mr. Gladson, now with Mr. Orgill. Also the Chesapeake Bay dog Greek, by Mr. Jno. Stewart's Turk ex Mr. Martinet's bitch. Address GEORGE BROWN, No 4 Exchange Place, Baltimore, Md. mar17,4t

FOR SALE, the elegant black-and-tan Gordon setter stud dog, St. Laurent. First prize winner New York Bench Show; full pedigree; is thoroughly broken on all game and is sure in the field. Also two beautiful red Irish setter bitch puppies by Rory O'More, out of Beesey, and she by Miley's imported York, out of Dittendorfer's Bess. They are four months old, of a deep red, except a few white hairs on breast. Price of pups, $25 each. Also my red Irish setter bitch Beesey, by Miley's imported York, out of Dittendorfer's Bess; is three years old; deep red; is thoroughly broken on all game; is second to none in the field and a perfect retriever. For further information on any or all of above, address R. RUSHMORE, 70 and 72 Bowery, N. Y. Mar24,2t

Hotels and Routes for Sportsmen

"THE FISHING LINE."

TAKE THE

Grand Rapids & Indiana R.R.

Mackinaw, Grand Rapids and Cincinnati Short Line

FOR THE

Trout, Grayling, and Black Bass Fisheries,

AND THE

FAMOUS SUMMER RESORTS AND LAKES

OF

NORTHERN MICHIGAN.

The waters of the

Grand Traverse Region

and the Michigan North Woods are unsurpassed, if equaled, in the abundance and great variety of fish contained.

BROOK TROUT abound in the streams, and the famous AMERICAN GRAYLING is found only in those waters.

The TROUT season begins May 1 and ends Sept. 1.

The GRAYLING Season opens June 1 and ends Nov. 1.

BLACK BASS, PIKE, PICKEREL and MUSCALONGE, also abound in large numbers in the many lakes and lakelets of this territory.

The sportsman can readily send trophies of his skill to his friends or "club" at home, twice for packing fish can be had at many points.

TAKE YOUR FAMILY WITH YOU. The scenery of the North Woods and Lakes is very beautiful; the air is pure, dry and bracing. The climate is peculiarly beneficial to those suffering with

Hay Fever and Asthma Affections.

The hotel accommodations are good, far surpassing the average in countries new enough to afford the finest of fishing.

During the season Round Trip Excursion Tickets will be sold at low rates, and attractive train facilities offered to Tourists and Sportsmen.

Dogs, Guns and Fishing Tackle Carried Free at owner's risk.

It is our aim to make sportsmen feel "at home" on this route. For Tourist's Guide (an attractive illustrated book of 80 pages), containing full information and accurate maps of the Fishing Grounds and Hunting Parks, address A. J. SWEET, Gen. Pass. Agent, Grand Rapids, Mich.

Wild Fowl Shooting.

SPRINGVILLE HOUSE OR SPORTSMEN'S RETREAT, SHINNECOCK BAY, L. I.

BY A PRACTICAL GUNNER AND AN OLD bayman. Has always on hand the best of boats, batteries, etc., with the largest rig of trained wild-geese decoys on the coast. The best ground in the vicinity of New York for bay snipe shooting of all varieties. Special attention given by himself to his guests, and satisfaction guaranteed. Address Wm. N. LANE, Good Ground, L.I. Refers by permission to J. B. Shepherd, 891 Broadway and Wm. Dutcher, 320 Broadway, N. Y.

Virginia Midland R. R.

The Safest, the Shortest, the Best Route to Florida and South.

Hornbeam Rods

A SPECIALTY.

W. HUNTINGTON,

WILTON, CONN.

Makes a specialty of the manufacture of FINE HAND-MADE RODS of Hornbeam for fly-fishing. Every fly-fisher should have one of these rods, for whatever preference he may have these are the only thoroughly reliable rods, secure against breakage and capable of real hard usage. With one of these rods a sportsman may venture into the woods for a season and take no other rod, and be fairly sure of returning with it in serviceable condition. As made from wood of my own cutting and seasoning, they are powerful, easy in action and full of endurance. For circular send to WALLACE HUNTINGTON, as above.

GUNPOWDER!

Dupont's Rifle, Sporting and Blasting Powder.

THE MOST POPULAR POWDER IN USE!

DUPONT'S GUNPOWDER MILLS, established in 1802, have maintained their great reputation for seventy-eight years. Manufacture the following celebrated brands of powder:

Dupont's Diamond Grain.—Nos. 1 (coarse) to 4 (fine) unequalled in strength, quickness and cleanliness; adapted for glass ball and pigeon shooting. Packed in 1lb canisters.

Dupont's Eagle Ducking.—Nos. 1 (coarse) to 3 (fine); burns slowly, strong and very clean; great penetration, with a close pattern; adapted for glass ball, pigeon, duck and other shooting, with either muzzle or breech-loaders. Packed in 1lb and 5lb canisters and 6¼ and 12½lb kegs.

Dupont's Choke Bore.—Specially adapted for "Choke Bore" Guns, and particularly for prairie and upland shooting. Burns slowly, strong and moist; does not cake or burn on the barrels, gives both a good penetration and a close pattern, will be found well adapted for glass ball and pigeon shooting. Made of two sizes, only No. 7 and No. 5, No. 7 being the coarsest. Packed in 6¼lb kegs and 1lb canisters.

Dupont's Eagle Rifle.—A quick, strong and clean powder, of very fine grain for pistol shooting. Packed in 1lb canisters and 6¼ lb kegs.

Dupont's Rifle Fg. "Sea Shooting."—FFg. and FFFg. The Fg. for long-range rifle shooting, the FFg. and FFFg. for general use, burning strong and moist. Packed in 5lb, 1lb and 5lb canisters, 6¼, 12½ and 25lb kegs. Fg coarse, FFFg. fine.

Dupont's Sporting, Mining, Sniping and Blasting Powders of all sizes and descriptions. **Special Grades for Export.** Also Rifle, Cartridge, Musket, Cannon, Mortar, Mammoth, Hexagonal, Cubical and Pellet Powder, U. S. Government Standard.

Powder manufactured to order of any required grain or proof.

Agencies in all the cities and principal towns throughout the United States. Represented by **F. L. KNEELAND, 70 Wall Street, N. Y.**

N. B.—Use none but DUPONT'S Fg. or FFg. for long-range rifle shooting.

The Hazard Powder Co.,

MANUFACTURERS OF

GUNPOWDER.

Hazard's "Electric Powder."

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of one pound *only*.

Hazard's "American Sporting."

Nos. 1 (fine) to 6 (coarse). In 1 lb. canisters and 6¼ lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to shot guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6¼ and 12½ lb. kegs. Burns *slowly* and very clean, shooting remarkably close and with *great penetration*. For field, forest, or water shooting, it ranks any other brand, and it is equally serviceable for muzzle or breech-loaders.

Hazard's "Kentucky Rifle."

FFFG FFG, and "Sea Shooting" FG in kegs of 25, 12½, and 6¼ lbs. and cans of 5 lbs. FFFG is also packed in 1 and ½ lb. canisters. Burns strong and moist. The FFFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard *Rifle* Powder of the country.

Superior Mining And Blasting Powder.

GOVERNMENT CANNON and MUSKET POWDER; also, SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF, MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's Agents, in every prominent city, or wholesale at our office.

TO CORRESPONDENTS.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen.

Communications upon the subjects to which its pages are devoted are invited from every part of the country.

Anonymous communications will not be regarded. No correspondent's name will be published except with his consent.

The Editors cannot be held responsible for the views of correspondents.

All communications of whatever nature should be addressed to the Forest and Stream Publishing Company, Nos. 39 and 40 Park Row, New York.

FOREST AND STREAM.

Thursday, April 7.

THE SPRING SNIPE SHOOTING.

IT is time for the snipe to arrive. For three months our dogs have had nothing to do; now, for two or three weeks, they can have a little work. All of our readers who shoot have looked forward for weeks to the coming of the snipe. The guns have been carefully looked over, cleaned and oiled, the shells loaded, the long boots dragged out from their hiding place and examined to see that they don't leak, and the dogs given an extra amount of exercise to wear off some of the fat that they have accumulated during their enforced idleness, and to harden their muscles for the severe exertion of trotting all day over the bogs and through the mud and water. For the next three weeks the meadows will be thronged with shooting men of all sorts and descriptions. If you choose to visit these meadows, you shall see, on any day during the remainder of April, an army of skirmishers who have vowed death to the unlucky snipe. There you will find the man accoutred in yellow leather leggings, white corduroy pants, a green hunting-coat and a fancy cap, who bears a gun bright with German silver mountings, carries a fringed game bag swung over his shoulder and is followed by a rabbit hound. You will find, too, the dandy, clad in velveteen, with English high-laced boots, whose gun is of the most recent and improved make, and who is followed by, or rather around whom plays in circles half a mile in diameter, a well-bred pointer or setter, so wild and so little under command that it chases up every bird on the ground long before the gunner comes within shot. Mingled with these are the more sober-minded shooters, who, in long boots and quiet, well-worn suits of canvas, moleskin or fustian, handle their more or less well-broken dogs with a considerable degree of intelligence, and give a good account of themselves at the end of the day's tramp. Besides these men, there is the old fellow who carries usually a muzzle-loader, whose rags flutter wildly in the wind, and whom, but for his gun and dog, you would certainly take for a tramp. This man scarcely speaks to his dog, and his dog hardly looks at him, but between them they find more birds than all the rest of the shooters put together; and the snipe that gets up within range of the old man has a marvellously small chance for life.

Our green-coated hunter, if he has good luck, returns home from his snipe-shooting with a mud-hen, a spotted turtle and a musk rat, which he found swimming in a creek in the meadow, and which, after it was wounded, his hound retrieved in excellent style. The dandy has even less to show, for he disdains the turtle and the musk-rat, and has nothing but one snipe, wounded by some one the day before, and to-day picked up and somewhat mangled by the dog, from which he recovered it after a sharp struggle. The others have each three or four birds, while the old ragman has, likely enough, fifteen or twenty.

Snipe shooting on the best known meadows here in the East is no longer sport. It has become a circus performance, in which each one who carries a gun acts the part of clown. The grounds are crowded, and if a dog makes a point you see men hurrying from all directions to surround the bird, each one fondly hoping that when it rises, it may fly toward him. The ground, having been thoroughly beaten over by the shooters, a portion depart for other meadows, while others, more lazy or more knowing, proceed to roost on the fences, the logs or the musk-rat houses, near the best feeding spots in the hope that during the day other birds may drop in. Should an unlucky snipe, startled from another piece, appear in the heavens, each man of the waiting multitude hastily seeks ambush behind his late seat, and if the bird alights, a wild rush is made for the spot he has chosen for his refuge. It is go as you please in very truth, and when the unhappy bird arises, pounds of shot are sent after him by his panting and breathless pursuers.

There are many pieces of meadow or bog land, however—each of our readers probably knows of one or more and jealously guards the secret of its existence—where a few birds are to be found each season. One can go in the morning and start from one to three birds, and again toward night with a reasonable hope of picking up one or two more. The spot is probably a small one, and we know just where the the birds will be lying, according to the wind and the weather. The old dog trots carelessly, as a matter of form, through the portions where the birds never lie, and as he approaches the well-known feeding-ground, gradually slackens his pace. He takes advantage of the wind, and at the first breath of the scent stops until we come up. Then, slowly advancing and keeping just in front of us, he moves on a little farther, and stops once more. We step forward, and one, two or three birds get up. We kill what we can of them, and usually they can all be secured, and then pass on to some other ground. If we get a dozen birds and meet no one during the day we feel that we have done well, and go home at night contented.

Far different is the shooting in the West and Southwest, where a man can bag from fifty to seventy-five birds in a day. But, alas! the West and Southwest are far off, and the snipe is proverbially an uncertain bird, so that the business or professional man has but little encouragement to travel far for the spring shooting. Yet there are undoubtedly many localities which offer superb sport at this season of the year, but those who know where such places are as a rule keep the information to themselves.

The practice of shooting the snipe in spring is one which, in our opinion, is unhesitatingly to be condemned. We know well enough the old and worn out arguments in its favor: that the snipe are the only birds on which we can work our young dogs in spring; that they are the only birds we have which can be shot in the field between the close of the fall shooting and its opening the following year; but these statements are no reply to the undeniable fact that the birds are killed while on the way to their breeding grounds—nay, in some instances on their very breeding grounds, and often with eggs almost ready for deposition. These birds have been found nesting in Connecticut, New York and in Pennsylvania, and it is in the highest degree probable that, were it not for the uncompromising war which is waged up on them in the spring, many of them would each year raise their broods with us instead of, as now most of them do seeking safety from persecution in more northern latitudes.

We hope some day to see the game laws so amended that snipe shooting shall only be permitted during the fall migration, and when such a law is passed and observed we look to see the birds increase once more to something like their old numbers.

Most of our readers are old enough to remember when these birds were fairly plenty on our Eastern grounds, both in spring and fall. That day has long passed, nor can we hope for its return until the spring snipe shooting is done away with.

THE FISHCULTURAL DINNER.

FOR some years past it has been the custom to have a dinner at the close of the annual meeting of the American Fishcultural Association, at which dishes composed of such fishes as are attainable shall form a large proportion of the bill of fare. These dinners have obtained such a local renown for the quality of their menu and for their flow of wit that they are quite popular among gentlemen outside the association, and so it happens that on all occasions the latter outnumber the fishculturists. This year the notices read "Dinner of the American Fishcultural Association, at Sieghortner's, 32 Lafayette Place, Thursday, March 31, 1881, at 6:30 P. M. (Tickets, five dollars.)"

At seven about thirty-five sat down and found an elegant card with the same beautiful chromos on the covers which were designed for Mr. Blackford's trout opening, on the inside of which was the following:

MENU.

HUITRES.
Blue points.
Sauterne.

POTAGES.
Blondoise de tortue a la grande duchesse.
Bisque d'ecrevisses, cardinal.
Amontillado.

HORS D'OEUVRE.

Cafe.

Mr. Roosevelt, President of the Association, presided, flanked by Profs. Goode and Atwater, while Mr. John Ford, of the Times and the Ichthyophagous Club; Mr. Blackford, of the Whitebait Association; Mr. W. M. Laffan, of the Tile Club and Long Island R. R.; ex-Mayor Smith Ely; Judge Gedney; Mr. Geo. Bird Grinnell and Mr. E. R. Wilbur, of FOREST AND STREAM; Mr. Gilbert E. Jones, New York *Times;* Mr. James Annin, Jr., Rec. Sec. Am. Fiscult. Ass'n; Capt. J. H. Mortimer, the sailor naturalist; Mr. Charles B. Evarts and Mr. F. Mather, of the Ass'n; and Messrs. C. Norwood, Jr., R. B. Hill, Douglas Smythe, G. W. Van Siclen, W. Ottman, C. L. Van Brunt, Mr. Embee, O. N. Jordan, J. L. Perley, Gaston L. Feuardent, W. Haveshaw and several gentlemen from the press. Little of note occurred until *Raie au beurre noir* was reached, when some gentleman of an ichthyological turn discovered that *Raie* was only another word for skate, and those to whom the dish was new approached it with caution which was soon laid aside, and all pronounced it "good," some adding "excellent," and others indulging in other superlatives, while three gentlemen asked the waiters for another piece. With the advent of the almon the President arose and said the Fishcultural Association was now ten years old and its record was a proud one. The United States Fish Commission had grown out of it. Ten million salmon had been brought from California and planted in Eastern waters, and think of the good dinners in ten

million salmon! While he was in Congress he had advocated the propagation of fish, and James A. Garfield had voted to carry on the work. Now Garfield is President of the United States and the speaker is president of the Fishcultural Association. If part of the work of the association is to find presidents we can supply them for ages to come. Before the advent of the Smithsonian in fishculture we all knew a little ichthyology, but now they make new names so fast that we can't keep up, and he would call on Prof. Goode to give us the latest atrocity in nomenclature.

Prof. Goode said that perhaps the President would be best pleased with the restoration of the Russian name for the California salmon, which was now *Onc rhynchus t-s-c-h-a-v-a-t-c-h-a* (we hope we do not mistake the spelling), and he would leave the gentleman to pronounce it as he chose.

Mr. Fenardent caught the word "restoration," and immediately bethought him of the Cesnola statues, but his mistake was kindly corrected when the President remarked that while on the subject of words he would say that a gentleman had proposed a new Greek word for a class of fishes to-day, at the fishcultural meeting, which the author got stuck in pronouncing, and he now called on Mr. Mather to tell what it was and what it really meant. The gentleman referred to stated that it was late in the day to remember Greek words said in the morning, but that if the word was Greek to the worthy President, he would assure the members that it was also Greek to him. Mr. Hill was called on to know what relation the Long Island Railroad bore to fishculture, and replied that it was built entirely to afford facilities for this association to go a-fishing, and to bring skates to the President of the Ichthyophagous club, and referred to Mr. Laffan for confirmation. Mr. Laffan stated that his principal duties on that road had been to refuse passes to the President of the Fishcultural and his friends; that he had more than earned his salary during the past year and had been promised an assistant.

Judge Gedney rose to inquire if the skate which had been eaten to-night was of the roller or parlor variety; and from this time until 11:30 the wit flashed with such brilliancy that Seighorner turned down the gas in order that the fire department might not be called out, and our eyes were dazzled so that it was no longer possible to take notes. We remember, however, that Mr. Evarts spoke of the excellence of Vermont trout; and that Mayor Ely was called to account for the great numbers of little eels, after which the "good nights" were said and all retired to dream of skates eating chicken halibut on the half shell, or blue points pointing at the young eels which were running down the President's chair-back.

PROTECTION OF INTRODUCED GAME.

We print below the full text of a bill passed at the last session of the New Jersey Legislature and approved by the Governor, March 7, 1881. Such a law has been greatly needed by those interested in game protection, who have heretofore, when they turned out these birds, had no security that even the breeders let loose by them would not be shot or trapped by selfish or pot-hunting individuals.

The step taken by the New Jersey Legislature is in the right direction, and all friends of game protection will feel encouraged at the action taken by this body. It is earnestly to be hoped that other States will follow in the footsteps of New Jersey, and that at no distant day we may feel confident that birds not indigenous to the East may, at least, have a fair chance to establish themselves here before they become objects of pursuit to the sportsman.

The text of the bill referred to is as follows:

CHAPTER LXXVIII.

An Act to Protect and Propagate Grouse or Prairie Fowl.

1. Be it enacted by the Senate and General Assembly of the State of New Jersey, That where any person or game club shall, at their own expense, procure any grouse or prairie fowl, and turn out the same upon his or their lands or game preserve, and the same or their offspring shall stray or go upon the lands of others, it shall not be lawful for any person other than the owner of said lands or member of said game club to shoot any grouse or prairie fowl, and no person shall trap or catch the same.

2. And be it enacted, That any person other than those authorized by section one, shooting grouse or prairie fowl, or found catching with trap or any other device, any grouse or prairie fowl shall, upon proof and conviction thereof, before any justice of the peace of the county wherein the offense was committed, or any other court of competent jurisdiction, pay to the treasurer, for the use of said game club, or to the person turning out the same, as the case may be, for every such grouse or prairie fowl the sum of ten dollars, with cost of suit, or an imprisonment in the county jail not exceeding three months, or both, at the discretion of the court.

3. And be it enacted, That it shall not be lawful for any person to kill, by gun or in any other manner, any grouse or prairie fowl, between the first day of December and the fifteenth day of October, yearly and every year; every person so offending shall be subject to the penalties named in section two of this act.

4. And be it enacted, That every member of any association or organized game club in this State, turning out any grouse or prairie fowl upon their lands or game preserve, shall be and are hereby empowered to prosecute, either in his own individual name or the name of the game club of which he is a member, for the penalties above prescribed for the violations of the provisions of this act.

5. And be it enacted, That this act shall continue in force for a period of five years.

6. And be it enacted, That this shall be deemed a public act and take effect immediately.

ALL OF OUR READERS will peruse with interest the very full and exhaustive account of brant shooting on the Massachusetts coast which we publish this week. The author is an old brant shooter, and is thoroughly familiar with the particular phase of this sport which he describes, and no one could speak more authoratively on the subject than he.

The Monomoy Branting Club is certainly to be congratulated on its prosperous condition, and on the excellent sport which its members enjoy.

THE FISHCULTURAL ASSOCIATION.—We give this week merely a synopsis of the proceedings of the late meeting, but will give a full report of the transactions, papers and debates in future issues. It was one of the most agreeable meetings which the association has ever held, and the character of the papers read was fully equal to that of any previous meeting. The papers by Profs. Goode and Atwater were exceedingly valuable.

Qui s'excuse, s'accuse.

The Sportsman Tourist.

BRANT-SHOOTING AT CAPE COD.

WITH A BRIEF SKETCH OF THE MONOMOY BRANTING CLUB.

BRANT-SHOOTING is a peculiar kind of sport that but few have indulged in. There are many obstacles in the way. The haunts of the birds are few and isolated, their feeding grounds limited, their sojourn brief; nor can any degree of success be achieved without the proper appliances, such as a house to live in, boats, boxes, bars, live decoys and a skillful hand to manipulate them. When, however, all these are attained no spring shooting on the coast of New England gives greater satisfaction or better rewards the energy and skill of the sportsman. The birds are large, numerous and, gastronomically, have no superiors. This little goose must not, however, be confounded with the brant of the West. In some of the States almost anything in the shape of a goose is called "brant." Our bird—*Anser bernicla* and *Bernicla brenta*, Steph.—weighs about three and a half pounds. But they are not distributed universally along the Atlantic shores as are Canada geese, black ducks, coot and other aquatic birds. At the easterly end of Massachusetts is the nice, old-fashioned town of Chatham, and some three miles away to the southward of this is the island of Monomoy, a mere belt of sand running still further southward about six miles. Almost the whole of Cape Cod is composed of a granulated silicious sand which has great mobility in wind or water. Monomy shares the common heritage of the cape and her sister isles. Had Rip Van Winkle fallen asleep on Cape Cod in place of Kaatskill he would on waking have found the harbor, channels and islands metamorphosed as thoroughly as the people. Not many years since the bar or island of which we are speaking had a ship channel between it and another similar bar, Nauset, through which the commerce of the town was carried on. Subsequently a shifting current filled the channel with this moveable sand, connected the bars and closed the entrance to the inner harbor. Still later, during a severe easterly storm, a crevasse near the town was made in the outer bar which has since so widened as to allow the tide to ebb and flow through it. This change of current has not only chafed and fretted away the hill upon which stood the government lighthouse, compelling its removal, but also washed away the wharves, filled the channel and ruined the remnant of commerce that was left to the unfortunate town. What strikes one as most singular at this place is that at a depth of some fifty feet below the foundation of said lighthouse, where the hill has been cut away by the action of water, the stumps of large trees, quite unlike any forest growth of the present day in the vicinity, are exposed to view. Overlying these stumps is a stratum of clay which has the appearance of being hardened into rock by the pressure of the sup rincumbent mass of sand or some other cause. Similar instances of large stumps still remaining in salt marshes occur at Hingham and other places along the coast. Of course these large trees did not grow in salt water. Whether the erosive waves have destroyed the barriers that warded these denizens of the forest or the whole coast is more depressed than formerly, we leave to the researches of the archæologists to determine.

Facing eastward from Monomoy one sees the broad Atlantic where "they on the trading flood ply, stemming nightly toward the pole." It is no uncommon occurrence for a fleet of a hundred sail to be seen at anchor or struggling against wind or tide to reach a port, and many a gallant ship has been wrested from her course by the storm king and tossed upon the beach as a mere toy. After an easterly gale one of the objects of intense interest to tourists is the matchless grandeur of the spectacle of "hills of seas Olympus high" that dash themselves in thunder upon this sand bar, again and again to be absorbed in the bosom of the reluctant wave. On the westerly side of the island, stretching up and down some miles, is what is called "Chatham Great Flats," over which the water flows, varying from two feet to almost nothing according as it is full or neap tide. Adjoining these flats on the southerly or westerly side is deep, blue water where grows an immense quantity of common eel grass (*Zostera marina*) upon which the brant feed; and this is the great feeding ground for these birds on Cape Cod. So attractive is this locality that thousands of these little *Anserina* assemble here every spring to "feed and batten" preparatory to the long journey *via* Prince Edward's Island to their breeding grounds at or near the North Pole. It will be understood the marine vegetable that proves so savory a morsel to the brant grows in water five or six feet deep at high tide, and as these birds are not divers they can only feed at low or nearly low tide. Then as the flood tide drives them from their feeding grounds, particularly when it is breezy, the birds become uneasy and scatter about in little "pods" or flocks, evidently seeking other feeding grounds or more comfortable quarters where they can rest till the tide ebbs so they can return to the feast. It is during this period—from about half flood to half ebb tide—that the brant are flitting about over the flats and are liable to catch sight of and be lured to the decoys; and it is during these four or five hours each day that the shooting is done. The time for the brant to arrive from the South in spring varies considerably; in fact, none of the swimming birds—*Natatores*—are as punctual on time as are the waders or *Grallatores*. A warm, forward spring brings along the brant in considerable numbers by the 1st of March; whereas, a backward season will hardly make good shooting before the end of that month, and by the 25th of April so few remain as to offer the sportsman no inducement to pursue them further, though it is quite probable a few straggling flocks may be seen as late as the 1st or even the 10th of May. During this period they are constantly coming and going, especially when the wind is to the southward and westward. It will be readily observed that the shooting season at best only extends over a period of four or five weeks. They rarely stop at this place in autumn on their way South, and if they do are not fat or fit for table use. The birds on arriving in the spring enter the bay from the West in flocks or gaggles—varying from a few individuals up to several hundred—at no great distance from the mainland, sometimes passing directly over not deigning to stop even though their food is abundantly spread out before them, and thousands of their less suspicious brethren are feeding there, while other flocks will gradually lower themselves down, swing round once or twice, then plunge into the liquid element. All the migratory birds that follow the coast line must of necessity pass this point both spring and ball. Sometimes they lift and go over Nauset Bar or Monomoy Island, and sometimes they pass around the southerly end of the island, Cape Malabar, but the great mass rise to a safe altitude, strike a "bee line," east by north, and pass directly over this strip of land. We have often remarked that the leader of each flock must have a pocket compass placed in the top of his head so unerringly do they steer. The flocks of brant on arriving, departing or passing over are quite irregular in shape—now in column, now in line, now one end or the other folding upon the centre, now are in a bunch, then again in line, and as the little dark specks disappear away down the dim, distant eastern horizon they are more likely to hold the latter position than any other. Of all the multitudinous millions we have seen during the last quarter century not a single flock was ever for any length of time in cuneiform or V shape as are Canada geese. We do not pretend to say how they fly in other latitudes or under other circumstances. Dr. Kane and other good authorities have spoken of their flight as being cuneiform in shape in high northern latitudes. This may hold true at Wellington Channel or Rensselaer Bay, but does not accord with our observations at Cape Cod. One would naturally suppose on seeing these birds constantly feeding at any locality along shore it would be easy enough to kill them. There are many such places up and down our coast, but for reasons very few birds can be killed. At the mouth of Bass River many brant linger and feed through the entire season, but there are no "flats," no points where boxes can be planted and successfully worked; the water is too deep, the shore too bluff and the brant feed only at low tide. A box might be placed on the feeding ground, and operated for a short time during each low tide, but the depth of water in the immediate vicinity would prevent the recovery of cripples, an important item in brant shooting, and moreover, all our experience teaches us that shooting at these birds on their feeding ground soon drives them to other quarters from which they would never return. The same conclusion was arrived at on examining the harbor of Nantucket. It will be found even at Chatham that before any shooting can be done a vast amount of hard work is to be performed. The feeding grounds and flats are so far from the town that living there is not practicable, and a shanty or house must be built on the island. Boxes are to be made, pens constructed for holding the live decoys and a well dug for fresh water. This "well" arrangement is a curiosity to the unitiated. The island where the shanty is located is not over 200 yards wide, but of undulating surface, *i. e.*, composed of little hillocks and valleys or basins. If a hole three feet deep be dug in one of these basins and a common flour barrel inserted it will on the flood tide partially fill with pure, soft water, and will continue to rise and fall with each tide. The reason of this is that rain falls upon this porous sand and percolates till it reaches salt water, which, being of greater specific gravity, holds or buoys up the fresh water. If, however, one digs a little further down he will pass through the fresh water stratum, and arrive at bog mud, showing conclusively that this sand has been driven from the beach by the wind, and deposited on this ancient marsh. Other liquids may be indulged in at the shanty, but an abundant supply of fresh potable water will be found indispensable to health and comfort.

Various contrivances have from time to time been introduced for slaughtering these wary winged wanderers, but none have succeeded so well as shooting from boxes buried in the sand. It would really seem to one not acquainted with their peculiarities that those immense flocks could be approached by a sail boat within range, but again and again has this been tried and as often failed. A well trimmed "float" in the hands of a skillful manager was tried with no better success. For several years one club used that abomination of all true sportsmen, a "floating battery." This was anchored on or near the feeding ground, and for a short time met with moderate success, but the birds with their keen black eyes soon discovered the cheat and kept aloof.

The bay is miles wide, and a stiff breeze or squall lashes the flood into such turbulent waves as to endanger the life of the occupant of said nuisance, and it was a wise move when they concluded to abandon the battery and return to the old method of shooting from boxes. About the same time the battery was in use some twelve years ago wood decoys were introduced, but to our mind these are of doubtful utility. A large lot of wood decoys will undoubtedly attract the attention of a passing flock, but they rarely light with them, and if perchance they were deceived into such impropriety, the deception would soon be discovered, and so hasty a retreat made as barely to give the gunner a snap shot at a single bird. Nor are they very likely to swim up and mingle freely with dead bits of wood, however ingeniously carved or skillfully painted. It is true that sometimes a flock of brant that otherwise would not think of coming near the bar, will fly up and scale round a lot of wood decoys, but such flocks, scattered by doubt and fear, offer very little satisfaction to the sportsman, nor will any great shot ever be made in this way. Once fired at on the wing they will not return, but if allowed to alight in the water and swim up to the decoys a much larger number will be killed, and then the same flock will afterward visit the bar and repeat this several times on the same day. They do not seem to be frightened out of their wits when fired at on the bar, or near the live decoys, as they do on the wing or near wood decoys. Still, if two or three clubs are operating at the same time near each other, the one having most wood decoys, other things being equal, will get the most wing shots. But our boxes are not yet planted, and this is a job no one man can perform. A water-tight box large enough to accommodate three persons, must be about six feet long, three

and a half wide, and two and a half deep. One half of this is buried in the flats; the other is hid by sand being wheeled and piled up around it. Nor is this all; a bar twenty or thirty yards long, and two feet high, must be made and maintained for the decoys to run out on and for the wild ones to assemble upon. The sand must be taken at low tide from some little distance so as to leave the flats and bar moderately smooth and natural.

There is an enormous tendency in this Cape Cod sand to a dead level. Three hundred wheelbarrow loads may be to-day piled up to form a bar, which a high tide and wind will to-morrow send back to its normal condition of inherent "dead level." Early in the season, before the bars are consolidated, every high wind and tide does more or less damage to the bars, which must be repaired before the box can be used, as no brant will come near when it is in sight. Almost every newcomer volunteers a plan for preserving the bars, such as bags of sand, brush or stone deposits, piles driven around, concrete and canvas coverings. Some of these have been tried. As to the bag speculation, the first high tide dissolved the copartnership existing between the sand outside and inside the bags, leaving a splendid "scare-crow" behind, and the brush and stone experiment ended even more disastrously. The concrete covering stood up a little longer, but finally succumbed to the relentless finger of winter. The frost seemed to soften and disintegrate the mass, which yielded to the erosive agency of the waves, and it gradually disappeared. In the spring of 1877 a brilliant idea entered the head of one of the newly formed clubs. The bar was built, a trench dug around it, canvas (an old sail) hauled over, the edges tucked into the trench and covered to hold in place, a hole cut for the box and the border nailed to it. This at first was thought to work admirably. The brant, it was said, were not afraid of it. It would hold the sand in place and save an enormous amount of wear and tear of wheelbarrows and muscles. So highly was this scheme commended that the Monomoy Branting Club adopted it at their North bar the following season, but not with so satisfactory results. The sand will move under the canvas from one side of the bar to the other, by pressure of wind and water, leaving an uneven and unsightly pile for a bar not at all comparable with the natural sand bar; in fact the Monomoy Branting Club became so disgusted with it that during the latter part of the season of 1880, after it had been badly torn by a storm, it was removed altogether.

Another desideratum in branting is live decoys. No visionary enthusiast need lay the flattering unction to his soul that without these, or with wood decoys alone, he will meet any degree of success. Decoys are usually obtained in the course of shooting by being slightly wounded in the wing, when a phalanx is amputated and the bird is added to the gaggle. The little captives will, when placed in the pen with the old ones, commence eating corn, their usual diet while in captivity, and although they probably never before saw a kernel of corn, they thrive well on this simple bill of fare. Presumably, in their normal condition, they never see fresh water, and yet in bondage this is their only beverage. Nor do they seem to suffer by the change. Another peculiarity about them in captivity is that they have no sexual intercourse, lay no eggs, exhibit no incubating desire, are cold, dignified and reserved, especially toward other fowl, nor do they ever become fully domesticated.

All through the earlier history of branting at this place, and up to within about eighteen years of the present time, the business was carried on by 'longshoremen, who associated themselves together for convenience, in unorganized clubs of from three to six persons. In 1863 a club called the Monomoy Branting Club, consisting of four resident and fourteen non-resident members, was organized. A little later another club was formed, and still later a third, but neither of these have been as successful as the first, probably from the fact that the most available shooting points were occupied before they entered the field. Of all the immense flats we have previously described not more than four or five points are worth occupying, and from a single one of these—the "Mud Hole"—about as many brant have been killed as from all the others combined. This point has been for nearly half a century occupied by one family, father and sons, until their interest was merged in the Monomoy Branting Club. Fifty years ago, when flint-lock guns were in use, the boxes were partly covered over to prevent the diving fowl from catching sight of the flash, and thus escaping, as is well known to the older readers of FOREST AND STREAM, they would do.

The guns were run out through embrasures, and this method necessitated the order, "Ready!—One, two—Fire!" It was discovered, however, when the birds were with the decoys they were not so easily frightened, and all this roofing in arrangement was dispensed with, more particularly after the invention of percussion caps. As we have been connected with the Monomoy Branting Club from its birth—nay, more, acted as accoucheur upon that occasion, our remarks henceforward will have reference more especially to the doings of that organization.

In forming the club it was arranged that the non-resident members—persons living in Boston or vicinity—should build and furnish a shanty, provide boats, boxes and the necessary tools for carrying forward the enterprise, while the resident members—whose homes were at Chatham—should make and keep in repair the bars, do boating, cooking, taking care of the decoys and generally looking after the welfare and interest of the non-residents. We are happy to add that the plan has worked admirably and to the entire satisfaction of both "the high contracting parties." It is for the time being a sort of copartnership, the non-residents paying a stipulated sum for board and privileges, sharing equally with the residents in all the game killed. This plan knits the two wings together, makes their interests identical, each willing to labor for the other, each sharing the other's failures and successes. So admirably has this scheme worked that we believe it might be profitably introduced into large mercantile, manufacturing, mechanical or mining operations. Here labor becomes interested in capital and *vice versa*, and by this union of interests the happiest results would follow—profits would be increased, greater harmony prevail and those disastrous outcrops of a foreign growth—"strikes"—would be avoided. A shanty, or house, 12x16 feet, was built and furnished. This, however, was found, a few years later, to be too small for the convenience of the members and invited guests, and it was enlarged to double its original capacity, giving ample room for reading, sleeping, dining, cooking, storage, etc. If any one wishes to see the very personification of comfort, happiness, freedom, let him look into this shanty when it is in the "full tide of successful operation," where are eight or ten jolly "boys," each one brim full of fun, with a week before them of the best shooting New England affords, and say if in the whole wide world a counterpart to the picture can be found.

Here the lawyer quits the bar of justice for the bar of sand, his cause is "Clams *vs.* Clients," wherein the former are sure to win. The merchant, weary of watching the market and the rise and fall of commodities, mounts the unfailing "tide that, taken at its flood, leads on to fortune." The doctor smiles as he reflects upon the midnight ride, the bedside agony, the fatal end! The minister turns his back upon dogmas and doctrines, "far from mortal cares retreating," and participates cheerfully in the life of a sportsman. The entire freedom from all ordinary cares, the pure, bracing sea-air, the cheerful companionship, the total change of currents of thought, diet and exercise—all the surroundings seem to conspire to improve one's health, strengthen his mind, elevate his soul, fortify him against the assaults of any foe and send him backward home a healthier, happier and, we trust, a better man.

We will now suppose the shanty to be in perfect running order, three boxes—the "Mud Hole," "North Bar" and "Gravel"—generously bestowed in their respective bars and fifteen live decoys in the pen at the sunny side of the shanty ready for use. Boxes have been planted at "Inner Point," "Sedge Hummock" and other places, but the plant proving unprofitable was relinquished. The shooting capacity of the three boxes is at best but nine. The North Bar is quite low and overflows on each excessively high tide, while the Gravel is quite high and entirely useless on an extremely low tide, so that the box room is hardly more than six, while the shanty readily accommodates twelve persons. As the club consists of eighteen members, all told, with about as many more invited guests, it is necessary to group them into weekly parties of four or five non-residents, with the four residents, making a party at the shanty all the season of eight or nine, and this is really the working force of the club. Another peculiarity of the club is that the weekly parties rotate, *i. e.*, the party that is at the shanty this year the first week in April takes the second week next year, and so on through the round of seasons.

We would like here to introduce to the reader the resident members of the club by their names, as familiarly known at the shanty in 1880—"Alonzo," "George," "Washy" and "Reno." Mr. David B. Nye, now of Poplar Branch, Currituck Sound, N. C., was one of the four original resident members, but other business drew him thence, and in 1870 he withdrew altogether. Reno did not become identified with the club till 1875. But, see!—here comes our boat booming along down the channel with H. M., W. S. and the Doctor, in charge of Alonzo and George. Now she drops her anchor and her passengers and baggage are transferred to the dory to be landed. But even here is a difficulty to be overcome. The water is so shoal as not to allow a dory to reach the dry beach and long boots are in request. But there is the Doctor with his short top-boots, as usual! He can indulge in a "horse-back" ride. Well, 'tis ever so where "wishes are horses," and they all scamper away for the dear old shanty, which seems to stretch out its arms to bid them welcome. Now, all that big pile of *impedimenta* is to be "toted" a distance of a hundred and fifty yards; and what a heap of "traps" these Nimrods do carry! Well, here they are, at the end of a tedious nine hours' ride by rail, stage and boat, with no interruption save the hour beguiled at Chatham by one of Alonzo's inconiparable clam chowders. How eagerly the newcomers inspect everything pertaining to the shanty! With what freedom they criticise, compare, commend this or that arrangement! Beds are now overhauled, aired and re-made with clean, fresh linen; boxes and barrels are opened, trunks and baskets unpacked, clothing hung up on appropriate hooks, boots bestowed in proper places, guns mounted upon the rests and everything is changed in the twinkling of an evening sunbeam into one of the most cosey, home-like places imaginable. But, hold! the gods, both ancient and modern, must be propitiated. H. (who has a reputation in that line) is requested to produce one of his popular lemonades. Of course nothing stronger is indulged in—oh, no! Sportsmen never do overstep the bounds. Well, if one half the blessings bequeathed this commingling of soul and sentiment be realized, the President of the United States of America will never die, the country will ever be at peace, nor will poverty or disease ever again invade her borders. *Dinnees* are filled and as the smoky wavelets curl and crinkle among the rafters, the fried potatoes are crisp upon the range and the coffee aroma wings its way to welcoming nostrils. If the devil furnishes cooks, why, certainly the gods must furnish cookables. Abstinence produces appetite and yet all were filled. Then come those pleasant games at cards, exciting topics of conversation, predictions for the morrow's shooting. No! the morrow is "the Sabbath day of the Lord." O, shade of the Pilgrims! this hallowed hour shall not here—almost in sight of that shrine where first they knelt in supplication on this Continent—be descrated! No solemn church-bell summons sinners to repentance here; and yet the day is pleasantly and profitably spent in making music, watching the immense flocks of brant that arrive and depart, and in various ways holding sweet converse with Nature and Nature's God. As the day has been calm, the bars are in good condition and the prospects are favorable that Monday morning will usher in a week of grand sport. It will be high tide at 7:15 A. M., and the boxes must be occupied by 5 o'clock. The alarm-clock which acts as a sort of reveille, is set at 4 o'clock and brings every man to his feet. A hasty repast is improvised while each gunner adorns himself with his coarse, heavy wool clothing, oil suit, long boots and wool mittens. Three decoys are placed in each basket, and it is astonishing with what precision the residents will seize the particular birds that are to be worked on the same line, as there is no perceptible difference in the size, plumage or voice of the sexes. The boxes are distant from the shanty as follows: "North bar" about a mile, "Mudhole" half a mile and "Gravel" one-third of a mile. As the "North bar" is lowest, the tide of course reaches it first; and as the distance from the shanty is greater, Reno, who is as constant at the box as the North Star to the Pole, must start first. He takes with him S. and H. The high tide of the previous night had filled the box which must be bailed out ere it can be entered. The decoys are then fettered and allowed to run out upon the bar, and as the water is making around us they rush down for a morning bath which they seem to enjoy exceedingly. Washy, who has for some years managed the "Mudhole," is accompanied by M. and the doctor, while George with W. occupies the "Gravel." The parties had scarcely got well braced when a small "pod" of brant came flitting along toward the "North bar," and four out of seven were knocked down by S. and H. and gathered. "What is that black spot, away down there to the southwest!" asks Reno, after gazing steadily for a few moments in that direction. "It looks like a large flock of brant," he continues, the spot still holding his eager eyes. "Yes; it is a flock of brant, and they are heading for us," he adds. As the flock comes on and on, nearer and nearer, "Yes," he exclaims, "they are making directly for us. Now they turn! There—there they go, right in for the 'Mudhole,'" his face elongating at the sight. "Now," says S., "they have all lighted within two hundred yards of the box, and as the tide is still flowing they will be likely to swim in and give the boys a splendid shot." Sure enough, they soon catch sight of the decoys on the bar and commence swimming for that point. Only one head is now seen above the bar. The resident who manages the decoys keeps his eyes steadily above the edge of the box to observe what transpires and report to his companions who crouch down out of sight, especially when birds are approaching. As the brant assemble upon and around the bar the observer will notice these heads, and he understands the leader has signified to his associates that now is the best time to shoot, and they must very gently raise their heads so as to look out for the most desirable groups to shoot at and yet not cross the fire of the others. The order is now presumed to be given: "Ready!—one, two—Fire!" The first discharge should be simultaneous, the second at will. Then the box is suddenly vacated, and such a splashing and dashing after cripples, which are captured first, and afterward on the way in the dead birds are picked up. "A big shot," says H. "About a dozen," mutters Reno, who is never sanguine. "More," says S. "Can tell better when we arrive at the shanty," continues Reno. At this moment several sea ducks (*Somateria mollissima*) come puffing along and attempt to pass the "North bar," when, quick as thought, the three guns were aimed and three *Mollissima* were floating on the flood while a fourth was struck hard but managed to escape. "Those sea-ducks will carry off an enormous lot of shot," remarks S. "Yes," says Reno; "but if you only had another empty shell in your Boyd & Tyler we might count four in the box." As the tide flows over the flats a great many small fish are attracted hither in search of food, and these in turn draw after them many sheldrake. Three of these came near the "No. bar" and were reminded of their proximity by "Old Cherokee." One was gathered and one escaped with a broken wing. 'Tis useless chasing wounded sheldrake in water two feet deep. Twenty shells may be fired and the bird still live.

The tide is fast making over the bar, now "boring" up, now falling off again. "Shall we be driven?" asks H. "If it continues to flow hard we probably shall," responds Reno. Again it "bores," and a wavelet enters the box. The decoys are now unfettered and placed in the basket. Another wave forces the party to mount the top of the bar. Here is the dread alternative either to retreat to the shanty or stand on the bar for a long hour till the tide ebbs so they can re-enter. As the road lies between the Mudhole and Gravel, and as no shooting can be done at either during the passage, it is decided to stand it out. Usually on being driven when the Gravel is untenanted they "fleet" thither. At high tide when the wind blows fresh the birds are skipping about pretty lively, and some very good shots are likely to be made. A flock of about twenty brant drew near the Mudhole, and was greeted by a salute of six guns, and seven dead were left to be gathered, besides one "wing-tip" which gave Washy a hard pull to overhaul.

As soon as the tide ebbed so that the north box could be bailed out the party re-enter, put out decoys and proceed to business; nor were they long idle. "Is that a little black cloud or flock of birds away down there toward Harwich Point?" asks H. Reno, although remarkably vigilant, is not particularly long-sighted, and did not at first take in the situation, but after a while the little spot, as it moved slowly along apparently close to the water, attracted his eye. "O, yes; I see," and the little dark cloud drew bigger and bigger as nearer and nearer it came. "Yes, it is a large flock of brant coming right for our bar"—giving the decoy line a jerk at the same time. On, on they come. "Down, down" he cries, and two of the heads disappear. "They are now very near," he continues. "There, they swing around; now we have them; they are all in the water." The two heads, after a few minutes of awful suspense, are slowly raised and two pair of astonished eyes behold a hundred and fifty brant not as many yards away swimming hither and thither, coquetting and playing together entirely innocent of any danger. Gradually they work their way along to the southward of the box spreading about, some quite near and others more remote. At length they come together very handsomely within forty yards of the box. "Now, is our time," whispers Reno. "Are you ready?" he nervously continues. An affirmative response is made, and he gives the order, "Put over! One, two—Fire!" Bang! bang! go the six barrels, splash, splash, go the three pair of long boots. The dead and wounded are gathered with all possible dispatch, and but for one cripple the work would have been quickly done. This one, however, gave Reno a fearful jaunt. Away went our black-footed hero, paddling for dear life, toward the north pole, and away went Reno in pursuit. The pursuer had not the benefit of a long pair of legs, though he had excellent pluck, while the pursued was blessed with a splendid pair for the work before him. Now the brant seemed to gain on his pursuer, and now Reno on the object of his pursuit. S. and H. watched with breathless anxiety this little episode incident to branting. These birds are not divers, but stand up bravely till their pursuer is quite near, when they plunge in and swim under water; but they make slow progress and are then easily captured. Placing his bird under his arm he slowly returns. "Big shot," says S. "How many?" inquires Reno, as he jumps into the box and puts the decoy in the basket. "Twenty-three," instantly rejoin both S. and H., "and one cripple which makes twenty-four, and this beats any shot of the season," he rejoins, at the same time seating himself and commencing to fill his pipe. After such a big shot a great many wise remarks are volunteered, a great many suggestions made which are to apply to the future, but the future always brings with it an enormous amount of variability. As this conversation was vehemently progressing a flock of seven brant came up behind the box, caught sight of the decoys, swung round twice; but as the tide was nearly off the flats, and as they rarely light except in water, it was thought best to "give it to them." Four fell dead while a fifth dropped too wide out to be recovered. This was the last shot, and as the other parties had long since gone in Reno concluded to "take up." The dead birds are tied in bunches, and thrown over their shoulders, or across the guns, and amid mutual congratulations the party proudly sets out for the shanty.

Only four shots were fired at the "Gravel." At first a flock of nine brant came and alighted near the point of the bar, and as they "bunched up" five of them were murdered in cold blood. Then a pair whirled round over the bar apparently reconnoitering, but this temerity cost them their lives. The third shot was at a big loon (*Colymbus glacialis*), by George, and he was handsomely knocked down at eighty-three yards. A lone sheldrake closed the morning's work and the party retired. As soon as Reno entered the shanty he asks, "How many did you get, Washy, at that first shot?"

"Seventeen and two decoys," was the cool reply. "I hardly thought you got as many," rejoins Reno. "Ought to have had thirty," growls Washy, "and we should if I could have kept the Doctor down." And they all gathered around the breakfast-table as full of chatter and merriment as a pack of monkeys. "What does the morning's work foot up?" asks H. as the record must be entered in the journal. "Well, here it is: Mudhole, 27; North Bar, 32; Gravel, 7; a grand total of 66 brant! The evening tide is worthless, and there will be no more shooting till Tuesday morning. That night a fresh breeze sprang up from southwest bringing along a great many brant, and moreover, doing some damage to the bars, but there is no time in the morning for "sand rolling," and they must be hastily patched up for the nonce.

Tuesday morning all hands up at 4 o'clock, lunch and start for the boxes in the following order: First, Reno with W. and the Doctor for the North Bar. Next, Washy at his old haunt, the Mudhole, with M. and H. as companions, and last George and S. occupy the Gravel.

Alonzo, who is an excellent cook, runs the shanty, and did not our modesty forbid we would like to describe one of his bird stews; and then his quahaug fritters, clam chowders and cuisine generally have a reputation among gunners all over Cape Cod; but we must not waste precious time over such trifles.

As the birds enter the bay mostly from the westward the boxes all face that point of the compass. Scarcely had the last party put out the decoys, deposited the basket in the box and comfortably seated themselves when a flock of about seventy-five brant came pushing their way along up from the southward and lighted in the dark water near the Mud Hole.

"Will they swim up with the tide?" asks M.

"Fine chance for them—it is flowing rapidly," Washy answered, as the brant were playing, chasing each other and picking up floating eel-grass.

Now they turn and head for the bar, now sag away again. How exciting, how disheartening are these moments to the occupants of the box! Did the reader ever lie in a box or blind with a hundred ducks or geese swimming in for his decoys—now surging and falling away, now nearer and again more distant? Well, if he be a nervous man it is doubtful if he do not shake his gun-barrels out of the stock, and were it not for the steadiness of the veteran guide who handles the decoys and attempts to keep the neophyte steady he would be as likely to fire in the air or at the string of decoys as anywhere; nor would he be the first one who has done this same thing. Again the birds set toward the box. "Down, down!" cries Washy, and he alone is "the observed of all observers." On again they come, swimming hither and thither within a hundred yards of three throbbing hearts. Now, again they halt, then retreat, as though they were suspicious all was not right. At last one old "honker" starts for the live decoys, which have to be occasionally jerked by the check-cord to make them "show wing."

"Yes," says Washy, "he is coming right on to the point of the bar and the whole flock are following!"

At this juncture of affairs another flock of about forty sprang up from the westward, shimmered along, swung round and lighted with the main body. "R-ronk, r-ronk," ring a hundred voices; "Ruk-ruk" as many more—and such tumult and confusion! The two concealed individuals imagine all sorts of things—possibly they are let down at the very front gate of Babel, or on board an emigrant ship, or in an auction store. The guide quickly conveys the cheering intelligence that many of them are so far on the bar as to get "toe-hold" and the others are in moderate proximity. These birds are quite vigilant, and any sudden movement would instantly send them beyond the possibility of a hope of recovry.

"Raise your heads slowly," says Washy, and the two heads are gradually elevated to a level of the third, when lo! the bar is dark as Erebus with the waving mass. A few moments of nervous consultation as to the best group for each to fire at and the guide whispers, "Get ready." Just at this moment the birds spread suddenly about and frustrate the plans, producing dreadful uncertainty for a few seconds, but they soon "bunched up" again and the word was given: "Put over! Ready! Fire!" The smoke of six guns wreathes its way heavenward; out jump the two—splash! splash!—away they go! Washy takes a breech-loader along with him to knock over any wing-tipped birds that cannot otherwise be gathered. One "old honker," with just a little bit of a muscle of the carpus pricked by a stray pellet, is pulling foot for the dark, deep water, off Harding's Beach. No non-resident would undertake to chase a strong bird half a mile, and if he did he would certainly fail. The motion of the waves over the white sand brings on a dizziness to one not accustomed to this work, and makes him feel every moment as though he was about to "topple over headlong." Far different is it with the guide or leader who has spent his whole life upon the water. Away goes our little winged hero, following closely is our stalwart guide. Further on and further still they go, almost out of sight. On the way out Washy had gathered two or three dead birds, which he still held in his hand, and when within about a rod of the live bird he throws one of the dead to frighten the living, so that he will dive and turn two or three somersaults in a bewildered condition, so that his pursuer rushes forward and captures him. In the meantime the dead and wounded had been gathered, the bar smoothed off ready for another crack at them.

"How many?" asks Washy, as he stops to take breath.

"Nineteen and two decoys—twenty-one, all told," quickly responds H.

"Well done," says Washy, and it seemed to give him a "heap" of comfort as he placed that decoy in the basket.

"But, look you," says M.; "there go nine right up for the North Bar."

"Precisely!" ejaculates Washy, hardly yet recovered from his long tramp. Puff, puff. Away out in the dim distance rises the smoke and the flock is reduced to four. Not much time elapsed before a brace of black ducks (*Anas obscura*, Gme.) were seen swimming in for the "Gravel." The guns were brought to bear and in a few minutes they were quietly reposing on the bottom of the box. The brant had for some time been feeding in the channel between Monomoy and Nanset. The regular feeding ground extends from near the Mud Hole to the inner point, a distance of two miles. In passing from one to the other, as they do on each tide, feeding in the channel at high tide and at Inner Point at low tide, they are very likely to receive a salute as they pass in review before the boxes. A shot from the Gravel started a large flock from the inner harbor, and as they lifted and moved majestically along westward, it was like a huge black cloud, so thick and dark. On it moved toward the Gravel, and strange to say, notwithstanding the water was quite shoal, and in some places nearly off the flats, they all dumped down a little distance from the bar. Some were within gunshot of the box. What was to be done? A thousand brant, all within 180 yards of the two well charged guns. As the tide was fast leaving the flats, and the birds could walk around anywhere, and moreover as they began to stretch up their necks and show signs of suspicion, it was thought best to fire as soon as they should come together and offer a favorable opportunity for a good shot. This they soon did, and George gave the order and the two guns belched forth fire and smoke. Easy task to gather up the thirteen dead birds that lay upon the water. Scarcely was the shot made on the gravel when Washy's eye seemed to be riveted to the western horizon. After a few minutes, as if almost doubting the correctness of his own eyes, he says: "There is a flock of sea-ducks coming this way, I think." "No; they are brant," he continues, with much straining of the visual organs. After a few moments' pause he bursts out again, "I declare they are *Somateria mollissima*, coming right straight for the box!"

"They look to me more like brant," says M.

"No," remarks Washy, "don't you see how steadily they fly, and so close to the water."

On they came till within about eighty yards of the box, when their keen eyes caught sight of some movement—most likely the nervous motion of cocking the guns and getting ready for the reception. They all suddenly wheeled to the southward with as much precision and regularity as a file of soldiers. A grand fusillade of six guns ensued, but only one bird was left to remind the gunners of the wariness of these sea rovers.

Chatham is not a great place for Canada geese (*Bernicla canadensis Vieill.*), but early in the spring they are liable to become weather-bound, and get quite plenty in the bay and harbor. A large flock had been thus detained, several of which had been killed, and when the flocks departed for their more northern summer homes, a wounded companion was left behind.

As the party sat discussing the disappointments of the last fusillade, the habits and peculiarities of eider ducks, the advantages of chilled over soft shot, and various other matters, that crippled goose came swimming along and finally walked up on to the bar, looked disdainfully down upon his little congeners, then proudly strutted round as much as to say, "Here I am, large as life, and monarch of all I survey." There seems to be a natural antagonism between the species, and as our little decoys ran from the monster toward the box, as if for protection, and as his gooseship could be of no earthly use, his reign—like that of many earthly tyrants—was suddenly terminated by the regicide M., who in this instance held in his hands one of the improved Fox guns. The tide was now ebbing fast, and George had taken up his decoys and retired. A pair of brant came down by the north bar directly for the Mudhole, and as they approached seemed to slack up, as if to inspect the works or be introduced to the decoys, and as they drew close together were both let down by the unerring aim of Washy, with a single gun. Then a lone brant was dispatched by M. A single sheldrake by "Old Cherokee," which, as the tide was off the flats, was easily gathered, and this ended the morning's sport at this bar. We might explain that "Old Cherokee" is a 12lb. muzzle-loader Schaeffer gun, 7 gauge, and takes as an easy charge 7 drams of powder and 2½ ounces shot, and as H., the owner, is an old gentleman of conservative tendencies, and as "Old Cherokee" has served him so faithfully for many years, they will probably continue their friendly companionship as long as the owner lives.

It is not considered wise to shoot at passing fowl when brant are anywhere near, but still the boys will occasionally forget themselves and knock over a black duck, loon, old-squaw, coot, sheldrake, or even a gull, still such "vermin" is not counted at the shanty as belonging to the day's work. The tide is quite low, but Reno still sticks to the north bar, and he had the good fortune of bagging three brant out of a passing flock of six. The party also subtracted two from a flock of seven coot, and this ended the day. As the parties rendezvous at the shanty, oil suits, long boots and heavy clothing give place to light jackets and slippers, guns are oiled and put in the places assigned, mutual congratulations are exchanged and the birds are hung around on the building. It was a sight that would gratify the eyes of all sportsmen, epicures and *bon vivants*, as these birds when properly cooked are toothsome and fully equal to the best canvas back ducks. "How many are there altogether?" inquires the doctor, as if he wishes to make a diagnosis of the case and was studying "quantities." "Sixty-six for Monday and forty-five for Tuesday; one hundred and one brant as a grand total for the two days," responds H., and a jollier party never sat down to one of Alonzo's "gull stews" Startle not, gentle reader, when we tell you that for a real Cape Cod stew a gray gull is superior to any other fowl. Did'st ever eat a Cape Cod stew? It is not, I believe, mentioned by ancient authors as among the "seven wonders of the world," probably because language failed to do it justice. We had as lief undertake to describe Edwin Forrest as Metamora or Raphael's method of producing his Sistine Madonna. As long as memory lasts it will turn with pleasure to those halcyon days among the brant and bird stews.

The wind, which at early morn was southwest, a little later veered to westward, blowing fresh and doing much damage to the bars, which must be repaired before they are in working condition, and the residents, with such as would volunteer, went out after dinner for that purpose, with barrows and shovels. The bars are likely on a high tide and strong westerly wind to be shifted from the front to the rear of the box, but as the party cannot wait for the next east wind to transport it back it must be done by main strength. Roll-boards are laid from a distance of two or three rods, the barrows are filled, rolled upon the boards and dumped upon the bar, then leveled to give it an even, natural appearance and the work is done. On this particular occasion the "Mudhole" received one hundred and seventy-five of these raw recruits, and it is splendid exercise—almost equal to dragging a hand sled up a long hill with a prospect of a "coast" down again. It is also an excellent specific against dyspepsia, strengthens the muscles, expands the lungs, purifies the blood and brings in its train that sweet repose—that blessed, dreamless slumber entirely unknown to indolent persons. The bars are now in good order and ready for the morning's sport; but we will not weary the reader with the recital of the remainder of the week's work, but will close this already too much extended article with a few extracts from the Monomoy Branting Club journal, wherein is recorded a faithful account of all the doings of the club from the first day of its organization up to the present hour.

"*Wednesday, March* 23, 1864.—Wind N. E., snowing and blowing a gale. No one could lay, boats were driven ashore, bars leveled, etc. It was a terrible day! About noon Alonzo and Jock went to "inner point" and got a shot at black ducks; knocked over seventeen, but recovered only nine. George went out and picked up a sea-duck. Gloom was depicted upon the countenances of the crowd. * * * * Only a sportsman can appreciate the disappointment of a brother sportsman at the loss of two or three days out of the six allotted to him each year."

"*April* 20, 1867.—Wind S. W., with slight prospect of rain. Blew fresh on the flood, but did d away on the ebb tide. High tide to-day at 1:30, though not a full one; the party in high expectations of a good day's sport, in which they were not disappointed. The highest number bagged in any one week since the club was formed is one hundred and fifty-eight, and the present party is anxious to beat this. They had already—four days—one hundred and twenty-seven, and as the wind was favorable and as brant decoyed exceedingly well this spring, they were quite sanguine of success. David Greene and Burleigh laid at the "Mudhole" and killed forty-two; Wales and Wood knocked five out of a passing flock at the sedge hummock; Washy visited his old haunt—the iron coffin of Dudley at the north bar—where he made a splendid shot, killing thirteen; one more shot added another brace—sixty-two brant for the day! And a happier party never dined on roast beef at that seat of hilarity—the shanty of the Monomoy Club. They had been the best week of the club by thirty-four, and in honor of the occasion the last regular bottle of whiskey was broached and a bumper drank to the champions."

This was the best year of the club, footing up 715 brant. The largest day's work this year was seventy, and the largest since the club was formed was on the 5th of April, 1869—one hundred and twenty-six brant! The whole number of brant killed by the club since its organization—eighteen years—is 5,438, a yearly average of 302.

The following is from a private memorandum showing the work done at a single box on half a tide, before the club was formed: "April 10, 1862.—High tide about 9 o'clock A. M. Tides are an hour later here than at Boston. Wind east and blowing a gale. Brant have been feeding in the harbor for some days, but to-day they were driven by the wind into the bay. Laid with Dean and Weston Linnell in the "Mudhole." On the flood tide had a great many brant come near enough to shoot, but waiting for better chances, did not fire a gun till the tide drove us and we went to the shanty for lunch. Returning about 9:30, bailed out the box and set decoys. Legions of brant all about us. The first shot, 18; second, 18; third, 23; fourth, 16; fifth, 21; sixth, 10; in all, 106 brant, and were through before 12:30 M. As the wind was high and blowing hard off shore we lost a great many cripples."

This brings us to the end of the week, when we must give place to the party that is to arrive this evening. And now comes the hurry and bustle of picking up "traps," dividing the birds, packing and "toting" to the boat, the embarkation and, what is the most painful of all, the last good-bye to the dear old shanty.

W. HAPGOOD.

Natural History

THE MORALS OF BIRDS.

WE are a little given to imagining that any beautiful creature must possess moral qualities similar to those which adorn its outward form, and it is somewhat of a shock to us to find as we so often do that the characteristics of the heart and those of the body have very little in common. The so-called meek and gentle dove is in fact as pugnacious as a game cock, and much more so than a bulldog, and the "sweet little bluebird" will fight as savagely as a badger.

A few words on this point we take from the London *Globe:*

At this season of the year, when a deeper crimson comes upon the robin's breast, bird life is thought to be ideal happiness. If we are to believe a competent witness in the current number of *The Squire* such is not the case. Birds, we are assured, have all the bad qualities of mankind. They are deficient in love for their offspring, and have no more conjugal affection than the traditional rover. Their moral nature is often depraved. They hiss, and scold, and swear, and exhibit terrible pugnacity. The majority of singing birds have the tempers of wasps and are apparently never so happy as when then are quarrelling. A fourth of their lives is, we are told, passed in scolding and fighting. In their singing season, which is also their time for mating and contention, severe pitched battles, fought between candidates for matrimonial life, are of continual occurrence, males and females engaging in the fight on the slightest provocation. Those of the stronger sex, are of course, the more pugnacious and often fight until they are killed. The females also fight furiously for the males, and we are sorry to hear that when the contest is over the conquerors march off with the objects of their choice, "unless they should be met on the road by other viragoes, and compelled to give up their husbands by force." It is sad to know that the latter are so ungallant as to seem indifferent as to which shall win them, and remain idle spectators of the struggle. A male bird will allow two hens to fight for him until one of them is killed, and then with due humility accompany the victor.

At this period of the year, especially the woods and the fields are described as the scenes of desparate battles. Shrieks of triumph and shrieks of defeat mingle with the love-notes of the newly mated. Strife is visible everywhere throughout the feathered creation. The very songs we hear at dawn of day are, we are assured, more the result of rivalry and ambition than of joyous thanksgiving, the feathered songsters being desirous of drowning the voices of others, or of excelling them in vocal power in presence of the females

A NEW ENEMY FOR THE OSTRICH.—In the extremely interesting account which we recently published on the domestication of the ostrich no mention was made of any enemies more destructive to the birds than the wild animals of the country. These, as they are not specially numerous and are easily destroyed either by traps, poison or hunting, do not give the ostrich farmer much concern.

Within a short time, however, a new enemy has made its appearance, and so deadly does it appear to be, that its ravages are making themselves very seriously felt, and it is causing a great mortality among the young birds. This sick-

ness is found to be caused by the presence of an intestinal parasite– named by Dr. Spencer Cobbold *Strongylus douglasiæ*.

This worm was discovered by Mr. Arthur Douglas, and appears to subsist on the coats of the ostriche's stomach. No remedy has as yet been found for these parasites, nor has the cause of their existence been discovered, and the question of what is to be done in the matter is becoming a serious one to South Africa farmers.

SNAKE EATING SNAKE.

In the number of FOREST AND STREAM for March 3, a correspondent criticises the account given by me in a previous number of the paper of the killing and swallowing of a rattlesnake by a large gopher snake, particularly the statement that the victor bit off the head of the vanquished, and rejected it before swallowing the body, and the editorial comment is that the act could not be performed by a serpent.

It happened that I received the paper with the above comments at the house in South Florida where the affair is said to have occurred. I therefore showed the paper to my informant, Mr. Bartolo Pacetti, and asked if there was any error in my repetition of the story. He replied that there was none, that he saw the occurrence in his own door-yard, that it was seen by all his family, and also by a visitor, a Captain Hatch, master of a vessel trading on the coast. That the whole battle between the snakes occupied two hours during which they were closely watched, and were so fiercely engaged as to pay little regard to the observers, that the biting or chewing off of the head alone took nearly an hour.

And here Mr. Pacetti remarked that if the writer in FOREST AND STREAM had ever examined the teeth of a gopher snake, which resemble those of a fine saw, he might change his opinion as to the possibility of the act. He went on to say that the gopher snake had finished the business, and had gone away unharmed, that he, Pacetti, buried the severed head under a tree in the garden from fear of accidents from the fangs. Said he, "There is the tree where I buried the head, and perhaps I could find the bones of it there still, though it is ten years ago." This man is entirely truthful and trustworthy as will be testified by all who know him, and they are many, he being an old Floridian well known on this coast as the best fisherman in the region as well as a good hunter, and an Indian scout in the Seminolo war.

I may add that I also had the account of the biting off of the head in all its details from Captain Hatch mentioned above.

Such is the positive testimony which I produce to confirm my statement, which I may be permitted to say is of at least equal value with a negative founded on general theories.

Halifax Inlet, March 21. S. C. CLARKE.

FACTS ABOUT DEER—GLEN FALLS, N. Y., March 28.—*Editor Forest and Stream:* I notice in your issue of March 24 a communication from New Westminster, B. C., about deer and what becomes of their horns.

Now what I have to say I have ascertained by an experience of twenty-five years of hunting and trapping in the northern part of the New York wilderness, in the southern parts of Franklin and St. Lawrence counties, and it corroborates the opinion of the above correspondent in respect to the weight of large bucks. If the whole carcass weighs over two hundred pounds he is a "socker," and such are very rarely found; but occasionally I have captured deer that would go a little more when in prime condition. The heaviest one I ever killed was in October, 1876, three miles below the village of North Lawrence on Deer River, and I brought it there to ship it to Moira Station, the next east of where I then lived, but as I received a bid for the venison dressed, at 12½ cents per pound, I accepted the offer, for then I should have the skin, tallow and, lastly, the head and horns. I never saw a nicer set with one exception; the left horn had nine tips and the right but eight. Can any one tell by the tips how old he was? The meat of this buck weighed 203 pounds with the legs off at the knees and gambrels. I sold the horns on the spot for three dollars. I think the hide, rough tallow, legs and head and horns would, if weighed, have brought up his weight to 250 pounds. This was a buck that had fattened on the grain and turnip fields of the farmers. This, remember, was only one of that weight in thousands; but the funniest part of the whole affair of killing this old stager came in this way. It was near sundown, and getting impatient I had started for home—four miles—and left Deer River behind a few rods. Suddenly I heard my old dog, Spot, at work on the creek, and knew by the sound he was swimming; all of a sudden he started for the river below and I for the river above, and on reaching it I saw a wake as if some animal was swimming up. As I was going down we met in the gray of evening. He swam low in the water and was trying to hide as he had done before. It was getting dark, and being higher and having a side shot I held for his eye and let fly. Down went his old chair head, and what a floundering he made; but he couldn't get his big head out of the water. The fact was, my ball struck near the eye, but glanced and slid under the hide across his forehead and did not penetrate the skull but stunned him, and so the verdict was "found drowned." In respect to horns, when they are first shed naturally they are quite soft, and the bucks eat them before they leave unless driven from them. I have found them gnawing them, and tame bucks will also eat them if not provided with salt. —JOYNER.

It is a well-known fact that cattle will chew and mumble bones if they are not provided with salt.

CANADIAN BIRDS NOTES—NEW YORK, March 29.—Your correspondent, "Au Sable," in your issue of the March 23, paid a well-merited tribute to the valuable ornithological researches and observations of John Neilson, of Quebec, upon the Canadian fauna. I am authorized by Mr. Neilson to say that he is now engaged in arranging for publication through the columns of FOREST AND STREAM a series of short notes upon the land birds of Northern Canada. In a recent letter to me, Mr. Neilson adds that his notes are now well advanced and that he expects to forward them very shortly. You have already had submitted to you a few extracts from his voluminous memoranda.—G. M. FAIRCHILD, JR.

WINTER RANGE OF THE SONG SPARROW—Bradford, Pa., March 21.—In your issue of March 17 "Lycoming" is surprised at seeing a song sparrow (*Melospiza melodia*) through the winter. Last Christmas I saw one but heard no songs. March 16 I saw two and both were in full song. See "Coues' Birds of the Northwest," p. 139—"Winters as far north as the Middle States, if not in southern New England;" also Maynard in "Naturalist's Guide"—"Have taken it December 3.—STALIA.

We have seen this species wintering in Connecticut.

MATED, BUT NOT MATCHED.—I have long known that the god of love was, to say the least, very short-sighted, but have been loath to believe that the dear creature was stone blind; but I have just witnessed an exemplification of the truth of this that entirely convinces me of the fact. I will recount the tale that you may fully understand the reason for my belief. Some eight years ago, upon one of the coldest mornings of the winter, my little boy came running in all excitement and bade me come quick, for a wild duck had just alighted among the hens. Hastily seizing my gun and a couple of shells I followed him out and caught a glimpse of a strange-looking duck as she ran under the shed. Standing guard at the entrance, I ordered the boy to go in and catch her. As soon as he came near her she rose and started for the opening, and as she went over my head I made a grab and was fortunate enough to seize one of her legs, and, notwithstanding she gave me several severe whacks with her wings, I held on. Upon examination she proved to be a female "Muscovy." I clipped her wings and gave her the freedom of the yard where she has been ever since. Although I have provided several mates for her she has invariably turned up her nose at them and obliged them to keep their distance; and my fear, that "Old Prim" as we called her, would die an old maid, appeared well grounded. A few days ago I was presented with a pair of black-red, game bantams. I turned them down among the ducks—of which I have five pairs. The drakes held a short council of war and, deciding that the interlopers must be driven from the field at all hazards, advanced in battle array and at once commenced a furious onslaught. The cock, with the well-known pugnacity of the breed, stood his ground, and by a well-directed blow soon turned the tide of battle and forced his assailants to beat a hasty retreat. "Old Prim" had taken a lively interest in the scrimmage from the first, and when she witnessed the utter rout of her importunate tormentors, and probably knowing full well that "the brave deserve the fair," she modestly sidled toward the hero and with pinions spread as though she would embrace him, in humble homage knelt at his feet, and with the proverbial gallantry of his race he ardently responded to her loving advances, and ever since this devoted pair have been inseparable. Surely the love of this ill-matched couple is "proof strong as Holy Writ" that the gentle king of hearts is blind as a bat.—SHADOW.

SPRING NOTES—Hornellsville, N. Y. April 4.—Bluebirds and blackbirds arrived March 10.

Robins arrived March 12.

Song sparrows March 13.

A great many shrikes here now, a large white-headed eagle has been here for a week trying to get a meal of dead horse, but the crows drove him away—a nice bird surely for an emblem of American liberty!

April 1—Saw a large flock of pigeons flying east.

J. OTIS FELLOWS.

NEW YORK, March 25.

The following notes as to the advancement of spring were made at Eastchester, N. Y. I think they would be of some interest as showing the progress of the season. Birds were not as plentiful as they usually are at this date. *Turdus migratorious* is quite common, and a few specimens of *Sialia sialis* are flying. In a piece of plowed ground I heard the rather sharp notes of *Sturnella magna* which are very common on the salt marshes of that section, and should judge that they were residents. A scattering flock of black birds also noticed.

The frogs make the swamps echo with their music. Walking along the banks of the creeks that intersect the meadows in every direction I failed to see many *Testudinata*, a few specimens of *Nanemys guttoius* only observed.

On a woody hillside where the sun shone very brightly I noticed that the *Hepaticas* were just preparing to bloom. Last season they were in blossom the latter part of February; also in a swampy piece of woodland the skunk cabbage (*Symplocarpus fœtidus*) was projecting forth its curious spathe and spadix.

From the appearance of the burrow of an *Arctomys monax* I should judge that he had awakened from his winter's hybernation. CHAS. EARL.

BUFFALO, April 3.

Lake Erie is still covered with a solid sheet of ice of over two feet in thickness. The advance guard of robins, bluebirds, cow black birds and song sparrows made their appearance as early as the 20th of March, but have since then not been reinforced to any appreciative extent. They are all old males in good plumage. Niagara River is all open with the exception of the little creeks and slips running into it from the American and Canadian shore. Vast flocks of ducks, composed chiefly of bluebills, redheads and mallards, arrived a few days ago, and afford incidental sport to those who are hardy enough to decoy them behind blinds made of snow and face the cold weather which ranges only at mid-day above freezing point.

There are, of course, no authenticated reports concerning the arrival of the Wilson's snipe, although vague rumors are current that they have been seen in the neighborhood of the city. It is hard to conceive how they could manage to make their bearings unless by an attachment of the diamond disk to their beaks, as the ground is either still covered with deep snow or frozen solid wherever it is bare. Unless the long-looked for southeaster sets in soon we may not look for an opening of the navigation before the latter end of May, if not later. The southwest winds which prevail here, like trade winds in May, convert the bay into a vast refrigerator by the vast fields of ice which are finally firmly wedged up at that eastern terminus of the lake. CHAS. LINDEN.

TO OWNERS OF TAME GROUSE—CORTLAND, N. Y., March 26.—*Editor Forest and Stream:* In my article of March 3, signed "Mig," describing the tame grouse, I thought of making the suggestion myself that if the bird could be mated with a hen grouse—as the one I have is a cock bird—it would be well to try the experiment of breeding them in confinement. As this bird shows quite a disposition to mate with a bantam hen, it seems quite probable that with proper care and a suitable place they would, if mated, produce their young. If either of the two gentlemen that mention in the last issue of the FOREST AND STREAM having a tame grouse will try the experiment or send the bird to me I will give the matter a fair test.—EUGENE POWERS.

A FOND FOSTER-MOTHER—Sardis, Miss., March 31.—Last fall I was out in the country a few miles south of this place, and while stopping to let my horse rest in front of a country store the proprietor, very clever gentleman and an experienced angler, showed me a sight that made me open my eyes wide. It was an old yellow cat suckling two kittens and three young rabbits (hares). She had found them in a field near the store and, after guarding them until their mother came, caught and killed her, and gathered up the three little ones and brought them to live with her and her family in the store. They lived until they could run about the house then all three died. The foster-mother seemed very much distressed over her loss and for several days sat around the house and worried pitifully. This is a true story, and a number of gentlemen from town went out to see them.—CROCK.

PARTIAL ALBINISM IN CANADA GEESE.—New York.—On the 25th of March, while shooting Canada geese (*Anser canadensis*) at Capt. Lane's, Good Ground, L. I., a bunch of seven lit on our live stoolers, but out of gun-shot. While we were waiting for our tender to swim them nearer we had an opportunity to watch their movements as they washed and plumed themselves. The captain called attention to the way the gander was marked; his head had large spots of white on it instead of being all black. When we shot he was not among those killed, so we had no chance to examine him further. However, among those shot were two that were also partial albinos. In one the under part of each wing had about thirty pure white feathers in it, and in the other the white throat patch extended to the base of the mandible, which was also white to its tip. The eyes and other markings of these birds were normal.—WM. DUTCHER.

Game Bag and Gun.

THE WINTER AND THE BIRDS.

STATISTICAL REPORT SHOWING THE EFFECT OF THE STATE OF LAST WINTER'S WEATHER ON GAME IN DELAWARE.

THE very wide spread interest with which our notes on the effect of the winter on the quail in New Jersey have been received in all quarters has induced us to push our investigations still farther, and to include in our canvass the State of Delaware. This extends the inquiry still farther South and includes all of Maryland and all the northern portion of Virginia. The whole inquiry has thus covered a north and south area on this coast reaching from about north, lat. 41 deg. 30 min., south to lat. 38 deg. We wish to thank our correspondents for their kindness in so promptly responding to our inquiries.

NEW CASTLE COUNTY.

Centreville.—Birds are not very plentiful during the gunning season in this locality, owing to the fact that early in the fall season they travel south into the lower part of the State. The destruction has been somewhat greater than in former years. I think I am safe in saying fifty per cent. of the quail perished. They were fed to some little extent.

Christiana.—The destruction compared with the last five years has been enormous. I think two-thirds of the quail have been destroyed. A few farmers have fed.

Christiana.—The cold winter has killed almost all the quail. I have been making inquiries far and near, and have received poor accounts about the quail. The Game Association, of Wilmington, is importing quail from the Carolinas to fill the void. The rabbits have not suffered much, nor have the squirrels. I think the birds in our section have suffered by the snows this winter as much as they did in 1832, which nearly killed all the birds, and we had no shooting for some years. The loss in our section is ninety-five per cent.

Claymont.—I have understood from the farmers and sportsmen that the quail have been generally destroyed by the severity of the winter and the unusual quantity of snow. I have heard of no quail being seen or fed.

Delaware City.—I find now and then a man who has seen a covey of birds (quail) this spring, but am led to doubt the existence of more than ten per cent. of those alive at the end of the shooting season of 1880. Constantly recurring snows prevented successful feeding, and but little was accomplished.

Delaware City.—The effect of the cold and snows of the past winter has been very destructive to birds in this section. Fully ninety per cent. of the quail have perished. We know of several farmers who have fed such birds as took refuge in their barn or stock yards, or in other sheltered places near the dwellings. We have found whole bevies frozen at roost, and starved to mere skeletons.

Faulkland.—The cold weather and snow did the birds no very great harm in this section.

Forest.—The cold and snows have been very hard on the game in this section. The destruction of birds has been noticeably greater than in other years. I judge twenty per cent. perished. Very few birds were fed.

Forest.—A great many partridges have been destroyed; not less than 75 per cent. Few birds have been seen and none fed.

Glasgow.—The cold winter has killed ninety per cent. of the quail. The winter has been extremely hard on all kinds of game. We have a good supply of rabbits left. Birds have been fed and saved until the last heavy snows killed them.

Green Spring.—The quail were nearly all frozen in this section. Those that were left have since been destroyed by hawks. Gunners believe that the quail are all killed.

Greenville.—As a general rule we have but few birds in the fall, and what few we have are gunned to death. In other words there are more gunners than birds. I have not heard of any quail being seen since fall. No feed was distributed.

Kirkwood.—The birds suffered more this winter than for a long time past. Think one half have perished. People in many cases tried to feed them, but the snows drifted in the night and covered them up.

McDonough.—It is said that nearly all the quail in the upper part of the State have been killed, and fifty per cent. killed in the southern part of the State.

Marshallton.—The past winter has been a very severe one on quail in this section, and I should suppose some thirty to forty per cent. perished. Some birds were fed, but the majority neglected.

Middletown.—The extreme cold winter has nearly destroyed the game in our country. The destruction has been far greater than any winter since 1857. I think at least seventy-five per cent. of our birds have perished, Many were fed by the farmers, although it was a difficult task to reach them owing to the depth of snow.

Middletown.—The severe winter has destroyed seventy-five per cent. of the game in this section. The loss is greater than

in any year since the winter 1855-56. The birds were fed when practicable. They often froze to death rather than starved. We had more game last fall than in years.

Mount Pleasant.—Our birds almost entirely perished last winter, but very few are reported yet alive. Our farmers fed them whenever they could.

Mount Pleasant.—A greater percentage of birds perished than in a number of years.

Newark.—The winter has been very severe on the partridge or quail here, but some remain in good condition. Some few were fed, others lived on the wild grapes in the low swamp land. Quite a number were caught and kept over. The Game Association imported from North Carolina about 1,200 for stocking for use in the three counties.

Newport.—Nine-tenths of the birds have perished by the cold weather and snows. Some of the farmers fed some of the birds, but having no cover the hawks "cotched" the most of them.

Port Penn.—Destruction of game (quail) from the frigid severity of the weather last winter was much greater than in any previous years. But few birds saved by the exertions of the farmers and but few lived that had no protection.

Red Lion.—The farmers did all they could to save the birds, but the snows and cold weather caused many of them to perish. I would say nine-tenths of the birds died.

Red Lion.—Game is not as plenty as it was last spring. I know of no one feeding the quail through the winter.

Rockland.—There were very few game birds when the cold weather commenced. Some were fed, but the others are supposed to have perished.

St. George's.—The cold and snows have had a serious effect upon the quail in this section, though many have been protected, and the actual loss is not greater than usual from such weather. In this immediate neighborhood my inquiry and search has proven that not more than one-third of the usual number of quail have perished.

State Road.—There must have been considerable destruction of quail and rabbits in this vicinity. There are very few rabbits and not a quail to be seen.

Townsend.—The effect of the snows and cold has been most terrible and destructive on the birds. Whole coveys have been found dead, frozen and starved. My impression is that very few escaped except those that were fed and otherwise cared for.

Wilmington.—Game is exceedingly scarce in New Castle County. No care has been taken of the birds during time of snow.

Wilmington.—Should say at least one-third of the birds in the northern part of the State have been killed. In the lower portion, thanks to the pines which keep the snow from the ground in places, most of the birds manage to live. A good many were fed through the agency of our Game Association, others were cared for by country sportsmen. We are restocking the State and hope to have (all things taken into consideration) fair sport next season.

Wilmington.—From all I can learn in regard to quail in this section, the heavy and severe snows which covered the ground for about six weeks, our native quail are scarce. The Sportsmen's Association is making active efforts and have for some time been obtaining birds from the South.

Yorklyn.—This has been a hard winter on the birds, twenty per cent. have perished by cold or been killed by hawks. They were not fed regularly.

KENT COUNTY.

Bowers.—Some birds have undoubtedly perished, but though the loss is greater than for a number of years, the birds, having been fed by our farmers, are not exterminated.

Brenford.—The winter has destroyed more birds than usual, especially quail. No birds fed by farmers; in fact very few are left.

Camden.—In regard to the quantity of birds left after the severe snow storms in this section, I would reply that I have been gunning for past nine or ten years, and every year after the gunning season is over I take my dogs out at least once a week during the months of March and April for a double purpose—first to keep them in practice, and secondly to see how many birds there are left over. And in my opinion there are more birds this spring than I have seen for years; not quite so many small coveys; but for instance, where there would have been, had the snow not fallen, several small coveys of four or five birds each, all have gone together in one, I suppose for the purpose of keeping warm—and then our farmers and sportsmen have fed them; so I think, with what birds our Game Protective Association are turning out and the good luck of our native birds living through the very severe winter, we may look forward to plenty of sport next season. And now, in conclusion, Mr. Editor, let me say I don't mean to say that none of our birds have perished during the past winter. But the game laws of Delaware, as you know, commence on the first day of November and continue until the 15th day of February, and if the snow had not fallen and the gunners kept shooting until that time, I contend we would have had less birds than we have to-day. In other words, the gunners would have killed far more than the snow did, from the fact that snow fell about Thanksgiving Day, stopping all gunning for the season. We admire your idea of getting views from different parties and places for the benefit of the readers of your valuable paper.

Canterbury.—Game of all kinds has suffered very much in this vicinity.

Dixon's Chapel.—The people of this community or section think at least 50 per cent. of the birds were killed by the winter. We notice there are very few. Some farmer fed the birds.

Harrington.—We have had a very cold winter and some of our birds frozen, but not over ten per cent. of them I am sure. I am sure we have more birds now than we had last season at this time. Our shooting season does not run out until the 15th of February in this county. Our Legislature was in session when that first cold snap came, and we had a special act passed preventing the shooting or killing of any game for the balance of the season.

Hazlettville.—A great many birds have been killed from the effects of the cold and snows. I suppose 75 per cent. of quail are dead. The farmers to some extent have fed.

Hazlettville.—The hard winter has been very hard on quail in this vicinity. I suppose 50 per cent. of the birds have perished. The farmers fed the birds to some extent.

Leipsic.—We have not many birds in this section; the winter has killed nearly all.

Little Creek Landing.—The cold and snow have been very severe on all kinds of game, especially the quail have suffered, and a great many have perished. A great many birds have been fed by residents.

Magnolia.—The destruction of birds is scarcely noticeable except of quail, which I feel confident 75 per cent. perished. I saved one flock.

Magnolia.—The past cold winter and heavy snows have been very destructive to our game. Birds and rabbits have suffered fearfully. I think at least 75 per cent. of the birds were killed. Some farmers would feed the birds when they could find them, but the cold and snows came so suddenly upon them that the birds died before we could think they were suffering. Our game for the coming season I think will be very scarce.

Milford.—The cold weather and snow have been very severe on all kinds of game birds in this section. Partridges have suffered 25 per cent.; rabbits about 10 per cent. There were very few partridges killed in this section by the gunners, the snows being so deep, that they prevented the sportsmen from killing the birds. I am the largest dealer in game in the State. Last season I sent to Philadelphia and New York markets 7,000 partridges, 487 rabbits, 288 woodcock, and this season only shipped 2,200 partridges, 184 rabbits, 36 woodcock. I merely give you the above to show you the falling off in shipment. The partridges have been fed by the majority of our farmers. The game Protective Association have been buying the partridges from parties who have trapped them, and have paid as high as forty and fifty cents per pair. They purchased considerable of them in this vicinity, and turned them out a short time ago after feeding them all winter. A few days ago they received some Western birds, and have also turned them out, so the prospect is good for next fall shooting providing the summer rain don't drown the young birds. The rabbit shooters report that there will be plenty of this game next fall. From present indications not as many rabbits have perished as was first thought.

Petersburgh.—I should say there was 75 per cent. of quail killed.

Smyrna.—The partridge (quail), lark and opossum have suffered the most of all, but still we have plenty left if nothing more happens.

Smyrna.—The impression here is that nearly all of our quail have perished. Some few have been trapped and kept, and a few others have been fed by the farmers; but I think about 50 per cent. were destroyed.

Vernon.—Although the winter has been very severe on the game in this section, yet we think very few birds have perished. In a few instances they have been cared for by the farmers.

Viola.—Very few birds have perished here. From what I can learn not over 10 per cent. The timber lands have protected them. After the snow fell they got tame, and a great many were trapped. The Game Protective Association paid twenty-five cents for birds kept until spring, so that there will be plenty left to breed.

Willow Grove.—The winter has been very destructive to the birds in this section. The quail are mostly killed. I suppose three-fourths of them were killed. A few farmers fed them, but not much.

Woodside.—The cold and snow have killed a great many birds, yet there are many left. A few farmers fed the birds.

Woodside.—The birds have not fared so badly since the winter of '56 as they have this winter. In many places there have been found whole coveys frozen to death on the roost. I have noticed that this has not happened to the birds that have had a stream of water close by or a place that they could get water and gravel; but in places that they could not get water or gravel they are all dead. I think I can safely say that three-fourths of them are dead. The farmers fed a great many and tried hard to protect them from the negroes who were sneaking around and tracking them up and killing whole coveys at a shot when the birds were so poor that they could not fly. There are a good many birds in this section yet. There was very little shooting done here before the snow, and the coveys were left large, and where they were large they stood the winter better than small ones. I have three coveys on my place that have thirty-eight birds in the three. Did not lose one during the snow. They are in a heavy cripple. I also have eight Massina quail that have stood the winter nicely.

Wyoming.—None of the game has suffered except the quail. They have perished greatly throughout this section and in Maryland. They have been found dead by whole coveys. It will take several years to make good the loss.

Wyoming.—On account of the cold and snows a great many birds were frozen and starved to death. The destruction has been much greater than ever before. At least one-half have perished. Birds were fed when found.

SUSSEX COUNTY.

Angola.—There have been a great many birds frozen this winter, as the weather has been so very hard on them. It has been unusually severe.

Bethel.—So far as noticeable, the destruction of birds has not been greater than in the past. The quail have not been fed to any great extent with us.

Black Water.—The hard winter has killed most of the birds; they are very scarce—hardly enough to raise. The farmers fed them with seed.

Cool Spring.—The severe winter has not killed many birds in this section. They were not fed by any one.

Ellendale.—The destruction of birds has been about one-third greater than in other winters, and a great many quail have perished. The farmers fed a few birds.

Ellendale.—A great many birds have died this winter—about twenty per cent. The farmers fed the birds.

Frankford.—Many birds died from the effects of the cold weather. Farmers did not generally feed the birds from what I can learn. There are enough left for further hatching.

Georgetown.—The cold here last winter was intense, at one time being as low as 17 degrees below zero, but I do not think that any quail perished from that cause, although it was "close nipping." They were not plentiful here last fall, and consequently very few were shot as there was very little gunning. The farmers did not feed the birds, but several trapped them. I bought twenty-five pairs, the last of which I released on the 15th of February. I think there will be fully as many quail here next year as there was last. I am expecting more birds from our Game Protection Association soon, which I will at once put out.

Gumborough.—The cold weather and the snows this winter have been very severe on the birds. A great many have been found dead. I suppose 25 per cent. perished. The birds fed on the grain the farmers did not get in before winter set in.

Laurel.—The cold and snow this winter have killed at least thirty per cent. of our birds. Our farmers have not cared for the birds as they should have done, consequently many birds have been butchered at night. Our Game Association has been importing Messina quail and restocking the State with game.

Leves, Henlopen Farm.—So far as this farm is concerned, we have more birds, owing probably to my having sowed buckwheat, a patch on each end of the farm. We have three coveys with from eight to fifteen birds each. The prevailing opinion, however, is that the winter was very destructive, more so than in past years. I have no knowledge of farmers feeding birds.

Leves.—Winter very severe on birds. Loss of birds greater than ever before. Probably 10 to 20 per cent. of birds have perished. Nobody fed the birds around here; people are too indifferent.

Milton.—The past winter was a very severe one on the birds. For several days the thermometer was 8 degs. below zero. About one-third froze and starved to death.

Nassau.—The cold and snow this winter did kill a greater number of the birds than for many years before. I think I can say that thirty per cent. was killed. Some of the farmers and others fed the birds.

Ocean View.—There were a great many birds found dead this winter, more so than for several winters. They were not fed.

Rehoboth Beach.—I will say it has been a very hard winter on the birds. I should say about twenty per cent. has perished. I have not heard of one farmer feeding the birds; they take no interest in game.

Rezara.—I do not think the cold destroyed much game. The birds were not fed. A great many farmers did not get their crops in, the cold came on so early.

Seaford.—The hardest winter we ever had on game. Very few farmers fed the birds.

Seaford.—Quail have perished in great quantities during the past winter, we think eighty per cent. We have been getting quail this spring from North Carolina.

Williamsville.—This has been a very severe winter. In regard to game the cold has not been uncommonly destructive. The farmers did not take extra care to feed the birds.

NEW JERSEY GAME NOTES.

REPORTS as to the effect of the severe weather of the past winter on the game of New Jersey continue to come in, and we publish this week another installment of them. The very wide spread interest which this matter has attracted, even among people who do not shoot, is surprising. The great number of pleasant acknowledgments of our work, and the numerous complimentary notices of the press show in a most encouraging manner how strongly the idea that our game must be protected and increased, is taking hold of the people at large.

BERGEN COUNTY.—*Carlstadt.*—Game in our vicinity has suffered very much this winter. Many birds have died for want of food. Barn-yards were the only refuge for starving birds. Residents have fed some of the birds.

Broadway.—I consider the cold this winter has destroyed many more birds than usual. No farmers fed.

WARREN COUNTY.—*Calno.*—There seems to be an unusual number of quail, considering the hard winter. The farmers gave them attention by feeding. There is about the usual number of partridge in the mountains.

Calno.—The comfort of the birds has been looked after. There is the usual number of quail this spring. Partridge are growing much scarcer in this vicinity, although there seems to be an average number.

MORRIS COUNTY.—*Danville.*—At least one-half of the quail in this section have perished. Some farmers have fed and cared for the birds. We had a nice lot of birds, but they are scarce now.

SOMERSET COUNTY.—*Bedminster.*—The destruction of game birds in this vicinity has been greater the past winter than for several years. Fully forty per cent. have perished from snows, hawks and foxes. The farmers do not feed the birds at all.

UNION COUNTY.—*Roselle.*—The cold weather has not perceptibly affected the birds in this township. Some of the residents feed the birds.

MERCER COUNTY.—*Yardville.*—Game of all kinds is very scarce in this section, with the exception of rabbits. There are but few birds here.

MONMOUTH COUNTY.—*Colt's Neck.*—The destruction of quail by the severe snows of last winter is almost complete; have hunted around a good deal with good dogs and have only found sixteen birds.

Manalapan.—The cold and snows have taken off about one-half of the birds. In many cases the birds have been fed, and I think there is enough left to do well.

BURLINGTON COUNTY.—*Birmingham.*—Birds of almost every kind have suffered severely this winter in this neighborhood. I suppose thirty per cent. of the game birds have perished.

Mount Holly.—The severity of the past winter has been very hard on the quail in this section; also on rabbits. I suppose fully 25 per cent. of all kinds of game perished. In some places whole coveys of quail have perished. A few farmers fed the birds, but not many.

OCEAN COUNTY.—*Bennett's Mills.*—Fully one-half of the birds have perished. I do not think the farmers fed the birds.

Barnegat.—Birds are not numerous in this section of the country. The cold weather has probably destroyed two-thirds of them. The quail suffered severely and are now very scarce. More birds have died this winter than ever before known. Do not know of any farmers feeding birds.

Beach Haven.—The general impression is that many birds have perished during the winter.

Manchester.—Quail and rabbits are about the only game that winter here and more than one-half have been destroyed by the deep snows. They have not been fed to any extent.

Manchester.—Game is not plenty in this section. The quail suffered, and probably two thirds of them perished. Some of the residents fed them.

CAMDEN COUNTY.—*Sicklerville.*—The game in our section is quail, rabbits and pheasants. The cold and snows have completely destroyed the quail, with the exception of a few that we caught. The destruction of quail has been greater than has been known for years.

GLOUCESTER COUNTY.—*Williamstown.*—The snows and cold weather have destroyed all the quail in this place except what I caught and bought and fed. I had thirty-two birds—twelve hens and twenty cocks. I don't think out of 1,000 birds that were within two miles of our place when the season closed that over forty are left, and I had thirty-two of them. I do not think that a bird should be killed in Jersey next season.

Bridgeport.—The cold and snows have killed ninety per cent. of the quail. There have been a few birds fed

by the farmers. I have made inquiry of all the farmers and gunners in this vicinity and from my own knowledge I believe this report to be correct.

Cumberland County.—*Millville.*—The winter has been unusually severe on the quail. Many have perished—fully ninety per cent. The same is true of rabbits. Along the sea-coast only about sixty per cent were destroyed.

Greenwich.—Many birds and other game were killed by the severe weather during the winter. The farmers and residents did feed the birds, but many were found frozen.

Gouldtown.—The severe cold weather, attended with continued snow, has had the greatest effect to destroy the game ever known. The birds have been nearly all killed. I have not seen one since the snow. I think the hawks got nearly all or quite what was left. Pheasants and rabbits are very scarce.

Finley Station.—There are scarcely any birds left in this section. I think nine out of every ten quail have perished this winter and there were a great many birds in this section. The farmers fed them.

Port Elizabeth.—The birds have not suffered very much in our section this winter. They have been well protected by the swamps.

Cape May County.—*Cape May Court House.*—Game in this part of the county has perished with powder and shot, and the cold weather has about wound up the winter game. If the game society don't restock this spring the shooting is about finished. There are some English snipe (March 31).

Petersburgh.—The loss in this section has been principally in quails. At least one-half have been frozen to death. Quail took to the hard timber tracks and could not be fed by the farmers.

SPRING SNIPE NOTES FROM DELAWARE.

THE latest reports from the State of Delaware indicate that the birds have not yet come on in any great numbers. As soon, however, as the present cold snap is over, and we have either a southerly rain storm or a few days of warm weather, we shall expect to hear of the arrival of a flight. The moon is right and the birds may be looked for at any time. Through the kindness of our many correspondents we shall continue to furnish the latest information on this subject. The following notes will be read with interest by those who intend to travel the meadows and marshes this spring.

SUSSEX COUNTY.

Ellendale, March 30.—There have been a few snipe; they came last week.

Ellendale, March 30.—Very few snipe here.

Gumborough, April 2.—Not many snipe yet.

Lewes, March 30.—Duck-shooting is not a success. Snipe have made their appearance.

Lewes, March 31.—Duck-shooting fair at this time. No snipe as yet; about the middle of April we expect them. Plenty of geese going northward.

Lewes, March 31.—The snipe have come. The first dozen were killed yesterday on the Great Marsh by the best gunner in this vicinity.

Milton, April 5.—There are very few snipe this spring.

Nassau, March 30.—The snipe have just begun to come. Very good shooting.

Ocean View, March 29.—The meadows are in order for snipe.

Roxana, March 28.—It is time for snipe here early in April. No birds have been killed yet.

KENT COUNTY.

Camden, March 28.—I have heard of some snipe being killed, but not enough to make it worth while going out for, but I think they will be on by the second week in April if the weather will only get warm by that time. I find in my travels an unusually large quantity of woodcock, apparently getting ready to lay.

Canterbury, April 4.—We do not have any snipe here, as we are some distance from the water. There are plenty around the water courses, some eight or ten miles from here, if the cold has not driven them back.

Harrington, March 31.—The snipe meadows are a little too wet as yet, although there are some snipe on now.

Hazlettville, April 2.—We already hear of the snipe below.

Hazlettville, April 2.—No snipe have been killed as yet.

Leipsic, March 31.—Our snipe meadows are in good condition this spring. There are plenty of snipe.

Magnolia, April 2.—Snipe have come on our marshes; not yet very plentiful.

Milford, March 30.—Snipe-shooting has just fairly commenced. Quite a few have been killed. Your scribe killed sixteen yesterday, with the wind to the south'ard. Should it hold for a few days we would have plenty of them. Our sportsmen are making great preparations for them. I suppose in this vicinity, last week, there was killed by our sportsmen upward of a hundred snipe. Ducks are quite plenty on our marshes and considerable are killed daily and shipped to Northern markets.

Vernon, April 4.—We have no snipe.

NEWCASTLE COUNTY.

Delaware City, April 4.—The wretched weather continues, and we have had but few snipe.

Forest, March 30.—A few snipe have been killed.

Forest, March 28.—It is time for the snipe now.

Port Penn. March 30.—Snipe are bowling along rapidly now, and the shooting will continue good for several weeks yet.

New York—Cortlandt, March 20.—A flock of wild geese, thirteen in number, have been in our immediate vicinity for over a week. They have in the meantime been hunted by boys and full-grown sportsmen both day and by night with the use of lanterns. I cannot ascertain that any have been killed up to this time. They have never before been known to remain with us for so long a time.—Eugene Powers.

New York—Hayt's Corners.—Saw first robin on the 16th inst., bluebirds and chippies quite numerous here now. Have seen no wild geese yet. Snow most all gone; not a quail have I heard since January last. We have had a severe cold winter and I fear there will be no quail the coming season here. I trust there will be a move made by our best sportsmen here to purchase some to replace those which have been frozen.—L. E. W.

Scene in Court.—Judge: Why do you plead for you husband when he has just given you such a beating? Wife: Because the beating has made me tender.

THE STORY OF A WILD GOOSE.

Philadelphia, Miss.

SUNDAY, October 24, we had one of the largest flights of geese that has ever been known in this section, commencing about the middle of the day on Sunday and continuing through the greater portion of Sunday night. I went out of the house very often between dark and bed time to listen to the honking of the different flocks, and it was never the case but what plenty of them were within hearing. The geese were going southwest and none of them stopped with us. Some preachers reported seeing one flock that had five or six white geese with them, which was rather unusual for this country, as the Canada geese are the only ones that ever visit us, and they nearly always pass over without stopping. It is only occasionally during protracted cold spells that a flock will spend a few days or a week in some wheat field, but upon being shot at once or twice they go to other parts.

This migratory instinct which will enable migratory fowls to start for a certain point thousands of miles away, and go with unerring certainty to that desired point, unless frustrated by fire lights or other causes, is rather strange to man who has the higher order of intellect and will often get badly lost within a few miles of his own home. That geese can and do start for a certain point and make their way with unerring certainty the following circumstance will go far toward proving. It was many years ago when one morning one of my father's workmen came to the house and told my father that he saw a flock of geese alight in the wheat field. As they were out in the open field of young wheat it was useless to attempt to get near enough to them to get a shot with a shot-gun, so my father took a trusty old rifle and succeeded in getting a shot with it, but he had to shoot a long distance, and only wing tipped the goose he shot at. He brought it to the house, and as it was only slightly hurt some of the family concluded to try to tame it, and it was put into the garden and its wound dressed.

It was very wild at first, and the children on the place gave it the name of Wily. Soon, however, Wily began to show less fear, and before his wound was entirely healed he became so tame that he was allowed to stroll about the yard, and afterward to be placed with the tame geese and to go where he pleased during the day, but he and the other geese were confined in the yard at night. Wily soon seemed to be perfectly contented with his new home and companions, and showed no disposition to wander away. He remained with us I believe through the next summer and winter, and during the time seemed to regain the full use of his wounded wing, although from some misplaced feathers, or other cause, there was a constant creaking sound produced by his wounded wing while flying.

During the second winter that Wiley was with us there was a school opened within a few hundred yards of my father's house, and the children would often come down during recess and after school to see Wily, and they would often, by clapping their hands, screaming and running after him, cause him to take wing and fly for a considerable time. This became so constant that Wily would often leave the place and be gone during the day, but was sure to come home at night. As spring began to approach Wily seemed to grow restless under the treatment received from the school children, and one morning he did not wait as usual to be startled by them, but took wing very early, and after rising high in the air, and circling around the place many times, as if to take a farewell view of his late home, then with a few "honks," as if bidding those farewell who had loved and cared for him while with us, he turned his head northward and was soon lost to sight. Nor did he put in an appearance that night as we had hoped he would do. Days, weeks and months passed away, and still he did not return, and no hopes of ever seeing him again were entertained.

One day, after the next winter had fairly set in, a flock of geese were seen circling around the place, and the children ran out into the yard to look at them. They came nearer and nearer, and at last directly into the yard, and the leader of the flock alighted within a few yards of the dwelling-house door, and from the familiar creaking of his wing he was recognized as our Wily. The other geese in the flock not being accustomed to the noise and sight of the children would not alight, but after hovering over their leader a few seconds started away toward the wheat field.

Upon seeing their movements Wily arose, and after circling with them for a while took his place in front, and again headed for the yard. This he did several times, but upon being convinced that his family would not share his old home with him he carried them to the wheat field, but he did not fail to make repeated trials for a number of days to get them to take up their winter quarters in the yard.

My father and brothers commenced shooting the geese from the flock as we would need them for the table, and during the week they remained around the place killed seven of the number. The shooting was done with the rifle, and while the geese were in some portion of the field, and only as one was wanted for the table that the flock might not be scared away from the place. Up to the time that the seventh goose was killed Wily did not fail to make several attempts each day to bring his followers into the yard nor did he seem the least afraid of the noise or sight of anything on the place. It is supposed that the seventh goose was Wily himself as the balance of the flock suddenly left and never returned.

We have had several flights of ducks since the one mentioned above, and many of the ducks have stopped with us, but they are only to be found along the sloughs and marshy places in the river swamp. Deer are sometimes plentiful here, and turkeys are often to be found in abundance. We have a tolerable supply of quail, but there are so many briars and so much brush that there is not so much sport shooting them here as there is in more open countries. Squirrels were quite plentiful during the summer and fall, and it would have been an easy matter for a good shot to have killed from fifty to seventy-five during a day's hunt. Many could be killed in the swamps now, but they are not quite so numerous as they were two or three months ago. Farmers often have to guard their fields here to prevent them from destroying their crops, and it is a great blessing to the farmer that the game law does not protect the squirrel. They often afford good summer shooting, and when the game law protects other game the gunner takes revenge on the squirrel. The hare is tolerable plentiful, and do so much damage in the gardens and young orchards that it would be a great blessing to this section of the country if they were entirely exterminated. Our game law does not protect the hare and should not for we have plenty of better game less mischievous.

Our best sport here in the way of fishing is in May, and for what is here called blue bream. We take many other fish through the spring, summer and fall, many of which are very fine, especially what are here called trout (but what I suppose are really big-mouthed black bass), and what are here called blue cat, channel cat and forked tailed cat (all the same fish) I would not like to give weight of the largest of these bass, without giving names as reference, but if your correspondent who a short time ago spoke of a full-grown bass that weighed 7 or 7½ lbs. will take the trouble to write to Capt. James S. Lewis or Mr. Jesse Fisher, Watkinsville, Neshoba County, Miss., he will find that the trout (black bass) are often caught in this county that weigh from 9 to 12 lbs., and some extra large ones a little over 12 lbs. S. P. Nash.

AN ALLEGED DEER HUNT AMONG THE POCONO MOUNTAINS.

ON Tuesday, October 26, 1880, at 8:45 A. M., three individuals might have been seen loaded down with hunting gear steering for the depot of the Wind Gap Railroad.

The individuals referred to were Dick, Doc and Jim, and the two latter were bound for the Pocono Mountains for a few day's sport with the game in that vicinity.

Just as we reached the station the train hove in sight, and shortly after we parted with Dick, who waved us a farewell as we rounded a curve and disappeared from his view.

The weapons the two sportsmen carried were respectively a Deane and a Parker both 12 bores. As we calculated to spend some of our time in a deer country we took some buck shot cartridges with us, all stowed away in places where they could never be found in case of emergency. We regretted then that we could not take a rifle, but we rejoiced afterward that we had not done so.

Well, the distance to the Wind Gap (twenty miles) was passed over in the smoking car, where we made various surmises as to what our success would be.

We very foolishly left our dogs at home relying on our friends in the mountains. In due time we arrived at Wind Gap, a small village somewhat famous as a local summer resort. Here we met a gentleman who was going our way as far as Saylorsburg, and who promised to take our traps while we went through the woods in the hope of scaring up some game. On the way we flushed a bevy of quail from which we each got a bird, but as a slight rain was coming up and our time there was limited we went on, reaching Saylorsburg just in time for dinner. Our traps had gotten to the hotel ahead of us and were all right. They consisted of about 250 cartridges, two blankets, two rubber coats, two overcoats, camp, hatchet, tobacco, matches and a Colt .44. The latter was intended for bears, which are by no means uncommon in those parts.

After an excellent dinner, which was well attended to, Doc and I started out despite the rain to find something in the shape of game. One grouse fell to Doc's gun, and that was all we saw. Returning to the inn we played "seven up" till dusk, then came a good supper and a chat with the landlord. Doc bargained with him to take us as far as Effort (eleven miles), and shortly after we turned in. Next morning we started out early, and walked to Lake Paupaunoming to look for ducks. Saw none, but I had the good fortune to flush and cut down a grouse.

After breakfast we left for Effort where we arrived at 10:30. Now we were only six miles from our Mecca, but we decided to beat around the hills and swamps for such small game as might fall in our way. Our "friends" had gone back on us, so we had no dogs, and beating the brush is not much fun, still we had fair success and ate our luncheon with the air of men who were having a good time, but we regretted that Dick and some other club members were not with us. Next morning we pushed on for Pocono afoot leaving the bulk of our baggage with mine host, Herr Eberle. Passing along this road the tourist or sportsman cannot help admiring the picturesque beauty of the scenery on all sides of him. Right ahead looms great Pocono, and just as we saw it a dark cloud crowned its summit, and seemed to frown down at us poor mortals for attempting to scale its sides. In the rear was the great Blue Mountain chain, distant and hazy, stretching around the country at our feet like a vast wall whose only portal visible was the Wind Gap through which we had come.

We reached the summit of old Pocono about 9:30 A. M. Here, contrary to our expectations, we found a small wayside inn. Upon inquiry we found that the proprietor of the place, Steve Hurst by name, was out deer hunting, but would return about noon, so we passed the rest of the forenoon looking around for hares and grouse, in which pursuit we were moderately successful. On the return of Steve we "put away" a substantial dinner and started out, Steve and old Joe. Ebriott, both old deer hunters, leading the way.

The top of Pocono resembles the upper surface of a truncated cone, and is surmounted by a small mound known as Temple Hill for the base of which we started. When within a quarter of a mile of it we stopped and consulted as to what our best move would be. It was decided that Steve should go over the hill leaving us to watch the runways, so he gave us our directions and left. We waited, but no deer came in sight all that afternoon.

When Steve returned he said he had started a doe and two fawns, but they had gone to the north while we were carefully guarding the south. Next morning Doc proposed trying for deer again, but having strained my ankle the day before I decided to go off "on my own hook" and get what small game I could.

Before I had gone far a very large hare started off, giving me a fine chance for a quartering shot, so I let drive at him with the left never thinking of the fact that I had loaded that barrel with buck shot. But it hit him and he died instantly. When I held him by the hind legs at the height of my waist his forelegs swept the ground, and I am a six-footer. Shortly afterward I saw an eagle about 200 yards distant. I commenced "crawling" for him, but he left when I was almost within range.

About noon I returned, hoping to find Doc, but he had not got back. I waited two hours for him and then took my dinner *solus*. Just as I was rising from the table he came in, and with him were Joe and Steve, but no deer. They had been outwitted the same as the day before. At 4 P. M. Doc and I started back to Effort, which we reached without incident. We stayed there all night, and the next morning our man from Saylorsburg came for us with a wagon. He made much fun for the bystanders by his questions concerning our deer. The rest of our trip was made in a driving rain, and was uninteresting in the extreme.

We just caught the last train from Wind Gap to Bethlehem, and with a hurried farewell to our host were whirled rapidly home.

As we brought most of our game home we had a game supper for the club at a celebrated restaurateurs, at which Doc and I presided and were the lions of the evening.

Virginianus Occidentalis.

THE GAME OUTLOOK IN VIRGINIA.

THIS has been a hard winter—a fact and observation you have probably heard before; a winter such as the old darkeys love to sit close to their fires and tell of cold weather in "dem times when dey was young."

"Why, 'fore de Lord," said old Uncle Reuben, reaching up to the narrow mantel-piece and taking down his corn-cob pipe, "you folks talks about de cold! Why, when I was a boy 'longing to ole Marse Hill Carter, over dar in Powhatan, who owned a big place on Jeemes' River, dar was a winter dat done take de rag offen de bush. You all talk about dis time; why, it wasn't nuffin to dat. I remembers de time well. Everything froze—dat could freeze. My ole ooman, me and the chillern sot up night after night, side of the fire; it was too cold to go to bed. De hens, de turkeys—all froze stiff, and we lost all de fowls, 'cept a rooster dat roosted in de chimley. One day ole Marse Hill started us to de pond to get ice, but it had froze solid clean down to de bottom; and seein' as how he couldn't get it out no other way, ole Marse druv two holes in de ice, den put two cedar posts in dem, and den tied a big rope to de posts and hitched six yokes of oxen and ten horses; den de whip was cracked—and I hope I may live to die if he didn't draw up de whole pond to de ice-house and save de trouble of hauling, for we had nuffin to do but chop up de ice and frow it in de house—and——"

"Uncle Reuben," said Douglas, solemnly, as he started to go, "it is a mystery how an old man like yourself—some eighty odd—so near to the grave, should tell such a pyrotechnic lie as that. You'll swear you were General Washington's body servant next?"

"I ain't done told you half yit."

"Well, that will do;" and we left the old darkey soberly shaking his head.

But old Reuben was right after all—even if he did fall into the temptation that besets aged people, more than anything else, of telling yarns, for there is nobody to say them nay. When all of a man's contemporaries die it is a fearful strain for the surviving one to keep to the truth and never draw the long bow. But I digress.

In looking over some tattered MSS. of the old colonial times I find mention of the coldest winter in Virginia on Record. It was in the year 1779, and history tells us of another in 1810. On both of these occasions Chesapeake Bay was frozen solidly across and men and cattle passed in safety over the ice from the Maryland to the Virginia side. Now, if tradition and history have any truth in them at all, those times far exceeded our winter in severity, for, barring floating ice that has formed in the inlets and streams, no man alive has ever seen Chesapeake Bay covered even with a thin skim of ice. To bind the raging waters in its silent fetters would require for days the temperature of Spitsbergen or Iceland.

But the winter has been severe enough to kill much of the game in this State, and sportsmen are uneasy about the future outlook—fearing that their trusty double barrels will lie in their cases all unused next fall. But it is not so. The damage done is greatly exaggerated, and a close survey and scanning of reports from the country papers throughout the Old Dominion brings one to a close estimate of the truth of the game question.

In the first place, the rabbits have not suffered, as they can live, "chip, peit and sassy," on the bark of the trees, no matter how deep the snow is, and they will be as plentiful as ever next autumn.

The game bird of this State is, of course, the partridge, and they have fared ill or worse according to their section. In the tidewater region of Virginia there has been comparatively little snow, and Bob White ranges the woods and fields in its wonted numbers. In the mountainous southwestern Virginia they have been almost decimated. Around Lynchburg and the tobacco belt there has been but little snow and the birds are safe. In the great valley they are very scarce, but the sporting clubs are importing large numbers of live quail and expect an abundant return. In Piedmont, Virginia, the partridges have suffered severely, and there will be poor shooting in that section for a number of years to come.

But there comes a charm after every ill, and the great foe of the partridge—infinitely more destructive that the hawk, more deadly than the cat, more rapacious than the mink—has been destroyed in vast quantities. I allude to the crow—"old black Jim Crow"—who eats the eggs of the setting birds, and is a greater foe of our pet game bird than all others put together. I must confess to my suprise that the FOREST AND STREAM, when mentioning the gauntlet of enemies that the partridge was compelled to run a-muck, said nothing of the crow, that enjoys a nest of partridge eggs as much as a bear a hive of honey, or an alderman a dish of terrapin stew.

This winter has killed untold numbers of these black thieves, the intense freeze caused many to go perfectly blind; and when it is cold enough to make the crow go blind you can swear that the thermometer is pretty low in the bulb. Every farmer can bear witness to the singular antics of these ravens who have lost their sight, and every farm throughout the State has scores of these dead birds lying just as they have fallen.

So taking all things into consideration, there will be but little noticeable difference in the quantity of game in Virginia next fall, except, as I wrote before, in the Piedmont section.

One singular fact connected with the great bird famine was observed on the farm of Mr. Isham Keith, near Warrenton, Va. A hawk was seen eating the dead body of a crow—the first instance, I believe, on record of such a thing.—CHASER.

THE WINTER IN MARYLAND—Rockville, Md., March 27.—Quail are very scarce in our county, owing to the severe winter. I have heard of whole bevies being frozen to death. Still there are some in our locality. Around our town there has been seen several bevies, from three to twelve in each. The farmers do not feed them through the winter, as a general thing. We have a law for the protection of game, but it is very badly observed. We will endeavor to get a law passed this session of our Legislature to prohibit shooting for two years.—W. H. R.

CANADA—Three Rivers, March 30.—Spring shooting for ducks will commence here in a few days and promises to be good.—H. W.

BUNKER HILL CLUB.—At the annual election of officers of the Bunker Hill (Illinois) Gun Club, held March 20, Mr. Abe Harris was elected President, and Mr. Wm. Morris Secretary and Treasurer. The club is a wide-awake institution and in good condition, and proposes to look closely after law-breakers during the close season and enforce the law.

GROUSE TREEING.

IN view of the sad reports with which your columns have been filled of the destruction of our game birds by cold and snow, it is pleasant to be able to note one section of our common country wherein the reverse of this state of affairs has existed. The present winter has been all that could be desired for the preservation of our ruffed grouse, especially in the northern portions of the State. The snows came early and deep, and not a drop of rain fell from November till after the middle of February, the deep, light snow affording the noble birds all the protection they require to successfully resist the severest weather of which our rugged climate is capable. During a three months' sojourn in Franklin county, from which I have just returned, not a day passed, when the weather was suitable, that I did not see them "budding" on the birches, sometimes three and four in a tree. I have not seen them so plenty in years. One habit of theirs I have observed this winter which before I had not particularly noticed. When the thermometer is much below zero they do not come out of the snow at all during the day, no matter how calm and bright it may be, and during one cold snap, when the thermometer marked from 13 deg. to 31 deg. below, I never saw a bird excepting those I drove out of the snow; and, by the way, I know of nothing that will more thoroughly startle one than to have them suddenly tear out of the snow from between one's snow-shoes, filling hair and eyes full of snow. I have been watching with mixed feelings of interest and amusement the "partridge treeing" discussion in your columns, and was congratulating myself on being able to close it up in good style. But alas for the vanity of human hopes! "Mic Mac" has completely taken the conceit out of me. His article "tells it all." The "wonderful instinct" which enables certain dogs to find the birds in a tree, no matter how far they fly, is all explained by the fact of their hunting up the droppings. I know a dog, half coach and half bull, whose fame extends into several towns, which will find grouse in this manner no matter how high they may be perched or how long they have been there. PENOBSCOT.

Newport, Me., March.

WESTFIELD, Mass.

In the FOREST AND STREAM of Feb. 24 "Mic Mac" seems to doubt the possibility of treeing partridges by the use of a dog in this State. He says: "If our friend Jean Baptist should bring his little cur to Mass.' and walk through the woods, he undoubtedly would have the pleasure of seeing him put up some partridges if the undergrowth was not too thick; but that would be all he would see of them unless he followed them up to repeat the same unsatisfactory performance." We have still living in our village a hunter of ye olden time who, with his cur dog and Queen's arm (probably similar to Jean Baptist's King's arm, but of different gender) has brought in more treed partridges than I have seen before or since killed before bird-dogs in a sportsmanlike manner. The dog finally died, and he never owned another that would fill the bill So he played dog himself, by tracking the birds on the snow, and when flushing them he gave a number of short, quick yelps, very much much resembling those of the dog, and has often successfully treed the birds in this manner. I well remember my first gun and the first bird I shot with it. It was in the month of February, snow knee deep, and a crust that would almost bear my weight, when I started out to try the new gun. In passing through a grove of pines a short distance from the village I flushed about six partridges (I don't suppose I made an accurate count I was so flustrated). I did not see them leave the pines, so I made a thorough search of every tree in that grove, and passed and repassed beneath a certain tall pine, in which, hugging close to the body of the tree, I found and shot my first partridge, and not four rods from this tree I shot another that had not been disturbed by the noise While on the subject of charming partridges I will relate an amusing incident (at least it was so to an eye witness). Three of us boys started for Hampton Ponds, about five miles from the village, to prospect for ducks. We carried one double-barrel gun. Finding no ducks, we were leisurely rowing back to the landing when one of the party espied a partridge on the near shore. It was the work of a moment to turn that boat to shore, and one of the boys grabbed the gun, landed, and commenced to dance, hoot and whistle in a very extravagant manner, loading the gun the best he could in the meantime, and between every stanza of his song he would call on the rest to imitate him. So we all engaged in a regular Indian pow-wow until the gun was loaded and the bird shot. Partridge charming seems to be most successful in the winter months, and the nearer spring the better. All the above happened a few years ago, when the open season extended to March 1 in this State, but it was only last winter I knew of a partridge being kept in a tree until a muzzle-loading gun was charged and the bird shot by making a great noise as above.—S.

WENONAH, Gloucester Co., N. J.

Our winter here as elsewhere has been unprecedentedly severe, and I fear our quail are all dead. Immense numbers of small birds which usually winter with us have perished. It was warm all last week. The snow nearly all left us. Blue birds, robins, etc., made their appearance.

I read with interest your article in last week's issue upon the destruction of hawks. The present has been a good winter for thinning them out. Impelled by hunger they have been unusually bold, and an unusual number have been destroyed in this region. During the past two or three years I have myself succeeded in killing a good many. I use an old fashioned 16 lb. target rifle that did service through the war in my regiment (the U. S. Sharp Shooters) and although I am getting old and am seriously disabled I do not often miss a hawk at 200 yards and even more. There is a high clump of trees 206 yards from my residence from which I have killed several hawks firing from the window. Nearly all my gunning is done in this way, and my game is hawks, kingfishers, herons, muskrats and other intruders about my fish-ponds. I can still knock the head off a water-snake while swimming across the ponds twenty or thirty yards distant. I am the only person in the region who uses a rifle, and I have used rifles generally from comparatively early boyhood.

I notice the correspondence relative to killing grouse from trees. When a boy I lived on the "Western Reserve" and had a small, mongrel dog about the color of an Italian greyhound, but rather clumsily built. As a general hunting dog I never saw his superior. In those days black and grey squirrels were very numerous in all that region. Let me take down the old rifle, and this little dog would be wild with delight, and long before I could reach the woods he would be there and have a squirrel or sometimes a ruffed grouse treed. I could approach near enough either to knock their heads off, which I invariably did. In later years I was in western Massachusetts where ruffed grouse were very abundant. A man in the neighborhood who rarely took a gun in his hands had a little dog, a half-blood English rat-terrier, the other half being an unknown mixture. This dog would go with any one carrying a gun into the woods, but would go with no stranger without. He would always soon find and tree ruffed grouse, and many a one have I thus shot over him. In the same region some years later I owned a fine old fox hound which I had bought from an experienced fox hunter. He was splendidly trained and would rarely follow a fox out of the usual hunting season. He was a wonderful coon hunter, and during the woodchuck season turned his special attention to those mischievous animals. One damp day in the haying season I took my rifle, and, calling the hound, started for the back fields on a woodchuck raid. I had to pass some two or three hundred yards through some open, large timber (a maple sugar place). About 100 yards from me I noticed the hound walking slowly with his nose to the ground, but his tail did not manifest much interest in the scent. Finally I noticed the hound sitting down, something very unusual when I was out with a gun. As I was about passing near by he gave me a very solemn look, and then turned his eyes and nose upward. Glancing in the direction, and within fifteen feet of the dog and not over fifty feet from me, there sat on a maple limb a large, male grouse. Within three or four seconds his head had mostly disappeared, and he dropped within a yard or so of the hound, and bounded around very lively for about a minute. The hound did not offer to take hold of it, but with his nose rolled it over two or three times as it became quiet. MILTON P. PIERCE.

DUCK SHOOTING IN TENNESSEE.

SAVANNAH, Tenn.

HAVING an idle afternoon yesterday I crossed the river to the cypress pond, where I had heard there were a great many ducks and geese. The pond is large and shallow, encumbered with logs, brush, stumps and trees, and is almost inaccessible, being surrounded with sloughs overgrown with cane and other undergrowth, and at this season of the year full of water. After much exertion and no little wading, my companion and I reached the pond, and found there a great many ducks and a few geese. As the day was warm and calm the birds were exceedingly wild, especially the geese, which flew at our approach and did not return during the afternoon.

After a long search we found a small and crazy batteau, half full of water. Bailing this out, we embarked on the pond; but, fearing an upset, I left the boat and ensconced myself among three huge cypresses that grew out of the pond with their conical trunks nearly touching. These trees made an excellent blind, and there I remained while my companion paddled away to the upper end of the pond and concealed himself among the grass and weeds. In a short time the ducks began to return, singly and in small flocks, offering several close shots, and leaving some of their number floating quietly on the water. Although the trees afforded perfect concealment, their thick tops interfered greatly with my aim, causing me to lose some excellent shots. Calling to my companion I got him to land me upon a fallen tree, on which I found a rude blind constructed of bark and grass. Here I had very fair shooting until about sundown, when the ducks ceased to come. Just after sundown a large flock of turkeys flew up into the high trees in the upper end of the pond, where, I suppose, they are accustomed to pass the nights

My companion, hearing the noise made by their flight, came up after me, and, collecting the ducks I had killed, we started in the batteau to approach the turkeys. So alert were these cautious birds that even the slight noise made by our light craft was sufficient to alarm them, and they flew away into the high timbers toward the river. On our attempting to follow them we became entangled among the vines, brush and cypress knees, and it was dark before, after much hard work and several narrow escapes from capsizing, we at last reached the shore of the pond directly opposite our road home. Now we commenced to pay for our sport, and were not long in realizing the truth of the old adage of the rose and its thorns. Our path homeward led "thorough brush, thorough brier," across dark sloughs on slimy and treacherous foot-logs, through slashes knee deep in mud and tangled grass, and our uncertain steps were serenaded by the demoniac hooting of owls. The ducks we were carrying seemed momentarily to increase in weight, and when at last we emerged on the bank of the river and saw the lights of the village shining bright on the bluff, we were glad enough to rest. The passage over was soon made, and after a few minutes more I was at home, divested of my dripping shooting togs, clad in warm dressing-gown and comfortable slippers, and seated before a blazing wood fire enjoying a hearty meal. Wonderful is the spell that the chaste Diana throws over her worshipers. In a few moments the leaky boat, the clinging vines, the protruding kness of the ghostly cypresses, the deep mud and treacherous logs, faded from memory, and instead came pleasing visions of the swift flight and folding wings of the wary fowl, and the abrupt splash which followed the loud report of my trusty gun. WILL.

CALIFORNIA.—At the last session of the California State Legislature an amendment to the game law was passed making it a misdemeanor to snare or trap quail. This amendment if enforced will of course prevent the capture of small lots of quail for shipment to the other States, but that is a matter that will interest the residents of other States much more than the friends of game preservation in California.

The following is the text of the amendment:

"Any person or persons who shall at any time, net, pound, weir, cage or trap any quail, partridge or grouse, or any person or persons who shall sell or give away or have in his or their possession any quail, partridge or grouse that have been scared, captured or taken, in or by means of any net, pound, weir, cage or trap, is guilty of a misdemeanor."

CONNECTICUT.—Quail, which were very plenty last season, have all vanished. Friends and myself kept feeding different flocks at various places, but one terrible snowstorm settled that business as the snow was so deep it became impossible to go to the places where they lived. Of the six flocks of which I knew, only one is left. About eighteen or twenty birds in it. Spring birds have begun to arrive.—F. K.

The vigor of youth for the aged and infirm in Hop Bitters.

BRANT SHOOTING AT CAPE MALABAR.

PROVIDENCE, March 30, 1881.

Editor Forest and Stream:

Thinking it might interest some of your many readers to know how brant are hunted at Cape Malabar, I will give my experience for one week, commencing the 19th of the present month. Our party consisted of four members of the Providence Branting Club, who were drawn for the first week. We left Providence at 8 A. M. and arrived at Chatham, Mass., about 1 P. M., and after a good dinner took a boat with guns and baggage for the Cape, which is about four miles south of Chatham, and about half way to Monomoy, on the extreme end of Nausett Beach. The Cape makes out to the northwest from Nausett Beach, and is an island at high water There are two club houses on the Cape, one belonging to the Monomoy Club and the other to the Providence Club.

The shooting boxes are all located on the west side of the Cape in the Atlantic Ocean. There are probably 500 acres of sandy flats as smooth as a floor and as level as the water that are all bare at low tide. The boxes which are 7 ft. long, 3½ ft. wide, and 3 ft. and 4 in. deep are sunk in the sand not far from deep water, and the tops calculated to be about the height of ordinary high water. The helpers who shoot in the boxes with the members of the club and work the live decoys commence about the first of March to put in the boxes, and after they are sunk they begin to wheel sand in barrels to make a bar that will show a little at high water, and after the shooting commences.

They have to repair the bars at every low tide if the water is rough at high tide, and frequently the gunners are driven from the boxes in rough weather and have to wade ashore. The Monomoy Club have three boxes in this season, and the Providence have two. The boxes will accommodate two gunners and one helper. Wooden decoys are set at each box, and two live ones are on the bar, they are fastened with hopples attached to a long string that will reach to the end of the bar say about thirty yards, and when a bunch of brant come near enough to see the decoys a slight pull on the string will cause the decoys to show wing, and is about sure to call down the bunch. Great care has to be taken to remove every sign of human presence, all clothing has to be about the color of sand, and the slightest motion when birds are near is fatal to the decoying of brant. A single young brant will sometimes lead a large flock into danger, as they decoy much easier than old ones. The gunners take their places in the boxes as soon as the tide begins to come in, and the chances are good till the ebb tide is well down around the boxes, and at low tide you might as well hunt for brant in Broadway, N. Y.

Evening tides are not favorable as a general thing, as the birds do not fly much after 4 P. M. By watching the live decoys you can judge what the wild ones are doing. If the weather is cold and the decoys can reach the water they will stand so it will cover their feet, and if they cannot reach the water they will squat on the sand to keep their feet warm, and at such times brant will not fly much unless disturbed. The boxes are named—the two south ones are called the Mud Holes, and the next one to the north is the Gravel Bar and there are two on what is called the North Bar. The north box is about one mile from the club-house, and is a long wade at high water when the wind is blowing hard and the water from two and one-half to three feet deep. Our party in four days, with unfavorable weather, killed and saved forty-three brant and two black ducks, and out of twenty brant shot down from one bunch, seven were lost that fell in the water too deep to wade. A boat any where in sight or a floating barrel will destroy all hopes of decoying any birds. Our party were armed with the Parker guns, and some birds were killed at least 100 yards off. No. 5 shot for sitting shots at short range were used, and. No. 1 and 2 for long flying shots. The Monomoy Club killed thirty brant out of one bunch with six guns on the 24th of March. They had a splendid sitting shot, and then took them in the air. A journal is kept at each house, and tides, wind and weather all carefully noted and all scores recorded. The names of the hunters that occupy the boxes are kept, and they rotate with each tide so as to give all an even chance. There is generally a circus in the evening at one of the club-houses, and then with smoke and songs between the acts the time passes rapidly.

A. D. COY.

THE ARMSTRONG BILL.—You cite with commendation a section of Armstrong's Assembly bill, No. 242, which offers a State bounty for wolves, panthers, foxes, hawks and owls, and remark that there are other excellent points in that bill which you have not the space to notice. The subscriber would like to know if you approve Sec. 2, which is framed to prohibit the shooting in the waters of Long Island of any wild duck, goose, brant, coot, rail, snipe, plover or gallinule, between the first day of May and the first day of October? There are a great many gentlemen in this city and vicinity who enjoy a few day's sport with the bay birds at the proper time for shooting them, and who would like to know what Mr. Armstrong desires to accomplish. My observation and information have led me to suppose that their flight back from the northern breeding grounds is mainly over before the first of October.

If that be the fact is not this propsed amendment an absurd one? I would like to see in your columns full and reliable information from the baymen and their annual guests about the date of commencement, duration, etc., of the flights each way of the snipe and plover for the benefit of all concerned, our Legislators especially. Let me as a subscriber to your paper from its initial number thank you for the novel and complete statistical report showing the effect of the weather last winter on the game in New Jersey. That table alone is worth to me the price of a year's subscription. It is by such enterprises that the FOREST AND STREAM endears itself to its patrons and long may its banner wave.

New York, March 26. H. H. THOMPSON.

DEER HUNTING AT CURRITUCK.—I don't believe there is a place in the United States where deer are more plentiful to the size of the woods than they are in a certain spot on Currituck Sound. A party of men, four in number, shot eleven deer at this place in one day. One man shot five on one stand. It is a beautiful little strip of land situated on the east side of Currituck Sound and bordered by the Atlantic. It is only eight miles in length and two and a half miles wide in the widest part. Three of my friends and myself spent a couple of days there in February. We started about twenty deer in the two days and saw ten more; but not having any experience with that kind of game before, we were not very successful in bagging many of them. But if any person reads this who never shot a deer and would like that kind of sport, they can perhaps shoot one without much trouble at Currituck. It is only twenty-five miles from our place—just a good half-day's drive. Sportsmen who come to the Sound for the purpose of shooting ducks and can spare a day or two, can shoot a deer at the same time. I have a splendid pack of hounds at my command and any person or persons who like the fun of shooting deer next fall or December would do well to communicate with J. B. White, Knott's Island, Currituck Sound, N. C.

Should any one doubt what I have said about the quantity of deer, etc, they can apply to Josephus Baum, Poplar Branch P. O., N. C., and numbers of other parties who live on the sound.

The duck shooting has also been good on the north end of the sound during February and March. Henry S. Clarke, of Walpole, Mass., shot fifty ducks and one goose the 2d of March, and his bag has been ranging from twenty to forty-eight every day since. The weather has been so cold this season we expect good shooting until the 1st or 10th of April.—J. B. WHITE.

EXPENSES ON DOGS TO FLORIDA.—Baltimore, March 24.—Not as a champion of railroads, but as a fellow and interested sportsman I should be glad if "Kenwoc" would better explain his balance sheet, as given in your issue of 17th inst Figures, of course, do not lie, but they can sometimes be set down in error, as, according to my experience, they seem to have been in this case, unless there is some "inside track" between the two points (Charleston and Jacksonville) of which I am not aware, and, in which event I think "Kenwoc" ought to make it known for the benefit of the fraternity. In the first place he charges the account with expenses on three dogs from Charleston to Augusta, $4.50 for 137 miles, and from Augusta to Savannah $15 for 132 miles, being $19.50 for 269 miles—7¼c. per mile for the three dogs. Now, to this charge he should have added a foot note explaining that the route named is not the regular and direct one from Charleston to Savannah, the direct railroad route being only 115 miles instead of 269 miles, and at the same *pro rata* rate for the dogs their expenses would have been $8.34 (?) instead of $19.50, showing an overcharge of $11.16. In the second place he credits the account, "By three first-class tickets to Jacksonville (from Charleston), via steamer, $15." This is manifestly an error. There is but one steamer, and she is a good one—the St. John's—plying between the two ports, and Brother Brown, her genial purser, will tell you that he is a "one price" establishment, and that price is $10 for a first-class ticket from C. to J., making $30 for three tickets, equal to an under credit of $15, to which add $1 paid for dogs on steamer; and I think if "Kenwoc" will then strike a balance on this basis he will regret not having kept his original tickets and thus have saved $13.66.—TURNEY.

TENNESSEE—Savannah, March 21.—The shooting season just passed has proved the poorest I have ever known.

Birds seemed to be plenty in October, but the unusual severity of the winter drove them to the woods and canebrakes, whence it was impossible to dislodge them. As we have had no heavy snows, the birds have not suffered much from the weather, but large numbers have been trapped and shot on the ground by pot-hunters.

Ducks have been very scarce this season. They were here in large numbers about the 1st of November, but soon left. A few weeks ago they returned, remaining a week or two, and some good shooting was had. One gun bagged twenty-five mallards in two hours' shooting one evening about two weeks ago.

Squirrels are reported as abundant, and there are several flocks of wild turkeys in the woods along the river. The wild geese, which had been unusually numerous all winter, left us early in February. A great many were killed by shooting at them from the decks of the steamboats which ply our river. From all appearances there are quail enough left over to insure good shooting next fall, if we can have a dry June. We are having considerable excitement just now about mad dogs. Several cases of rabies have now been reported; but so far the disease has not attacked any valuable dogs. Up to this time it has resulted only in the destruction of some score or more of worthless curs; and if it spreads no further will prove an unalloyed blessing. WILL.

SNIPE SHOOTING—Tenn., Memphis, March 28.—The birds are now coming on to the Arkansas prairies in fair quantities. "Guido" and two friends have just returned from a two day's hunt on Grand Prairie, bagging upward of 200 birds. I learn that Mr. Orgill, of your city, now on a visit here, accompanied by Judge McDowell, starts to-day for a week's hunt on the prairies.—SOAPE.

MINNESOTA—Sauk Centre, March 22.—Judging from present indications the chicken shooting will be excellent the coming season. Yesterday, about two miles above town, I saw a large number of prairie chickens on the stubble fields where the snow has thawed away trying to get a taste of grain. The ducks and geese are eagerly looked for, and in a few days at most they will be here in abundance. Our sporting club are ready to make it "pleasant" for them as long as they feel inclined to stay.—DELL.

GULF CITY GUN CLUB—Port of Mobile.—At the annual election of the Gulf City Gun Club, held March 16, the following gentlemen were elected to serve the ensuing year: President, Frank P. Davis; Vice President, William B. Holt; Secretary, John F. Summersell; Treasurer, Jas. Alexander, Jr.; Attorney, William Boyles. Executive Committee: H. P. Vass, Chairman; Geo. W. Tunstall, Jas. C. Bush, Chas. L. Huger, Edmund Carre, William S. Goodall, Chas. W. Leslie.

WISCONSIN—Waushara County, March 24.—It is gratifying to know there is even an occasional reminder administered to violators of the game law in this State. Last week a man shot a doe near here which would have increased the tribe by two if allowed to live the proper time. The man was brought before a justice in Saxeville and fined $4.50 and costs, not a very heavy plenalty, but costly enough to give the poacher a wholesome respect for the law, it is to be hoped.—BADGER.

INFORMATION WANTED.

Mr. W. Humphreys, formerly of Newark, N. J., will please send his address to this office.

Can any one inform us of a fox hound in the stud in the vicinity of Woodbridge, N. J.

W. J. M. wants the pedigree of an Irish setter dog named Buck, brought to Norfolk, Va., by a young man named McFall, who once lived in Brooklyn, N. Y.

A CORRESPONDENT desires to obtain eggs of the sharp-tailed grouse to hatch under a bantam hen. Can any of our Iowa, Nebraska or Minnesota readers help him?

Sea and River Fishing.

FISH IN SEASON IN APRIL.

FRESH WATER.

Brook Trout, *Salmo fontinalis.*
Pickerel, *Esox reticulatus.*
Pike or Pickerel, *Esox lucius.*
Pike-perch (wall-eyed pike) *Stizostethium americanum, S. griseum*, etc.
Yellow Perch, *Perca flavitilis.*
Striped Bass, *Rocous lineatus.*
White Bass, *Rocous chrysops.*
Rock Bass, *Ambloplites.* (Two species).
War-mouth, *Chenobryttus gulosus.*
Crappie, *Pomoxys nigromaculatus.*
Bachelor, *Pomoxys annularis.*
Chub, *Semotilis corporalis.*

SALT WATER.

Sea Bass, *Centropristis atrarius.*
Striped Bass, *Rocous lineatus.*
White Perch, *Morone americana.*
Pollock, *Pollachius carbonarius.*
Tautog or Blackfish, *Tautoga onitis.*

THE ANGLER'S NEW YEAR.

ON the first day of April it is lawfully permitted to kill, have in possession, and to eat trout within the limits of the State of New York, and on this day the worshipers at the shrine of Salvelinus who may have been cribbed, cabined or confined within the city's walls all winter, either rush with rod and reel to Long Island or other adjacent waters, regardless of the east wind and its accompanying rheumatism, or they saunter down to Fulton Market to see the display of their favorites which has now become the annual fashion.

The weather was favorable to the display, being damp, and therefore the fish held their moisture and color, and the dirty old market was invaded by a well dressed and well behaved crowd of people, among whom were several gentlemen noted on the bench, in the pulpit and in the councils of the nation, as well as many ladies. Trout and rosebuds, trout and lilies, huge bouquets between layers of trout, baskets of exquisite flowers, flanked crimson flecked fishes and sea anemones which tried hard to rival the floral gems, made it a display worth a journey to see, and for two days Blackford's was crowded from nine in the morning till six by eager sight seers. Other dealers have caught the infection and decorated their stands with flowers, and the restaurants did the same and labled their fish with their respective localities—in fact it was the very apotheosis of trout!

The enterprise of Mr. E. G. Blackford in drawing specimens from the fishculturists at home and aboard, and in bringing great specimens from California and other distant sources, which he exhibits until they are past utilizing for food, at a great expense, makes his exhibit the great attraction. In his office was the famous stuffed specimen of *S. fontinalis*, of ten pounds weight, from the Rangeley lakes of Maine, caught by Vice President Page of the Fishcultural Association, some years ago. The old fellow has lost a piece of his tail, but does not seem to mind that as he does the fact which cast a gloom over his glass eyes, that on the wall opposite hung a hated rival of *eleven* pounds in plaster, cast from a fresh specimen taken last October and forwarded to Professor Baird, who had it used as a mould from which the present cast was made. The new aspirant for avoirdupois fame was painted to the life, and did not seem to be aware that he had done anything to provoke envy, but kept his weather eye on a glass case below him, exhibited by Gaston L. Feuardent, which contained a lot of pre-historic fish hooks of bronze from the lake-dwellers of Switzerland, a bronze "sacred fish" from Egypt, whose sanctity he could hardly make out, and some shell fish hooks and a bone pre-historic spear. Once we caught a decided sneer on the face of his eleven-poundship, as he evidently thought what a good time they would have had to take him out of the wet with such implements as that. Prof. Baird also sent a jar of the California "mountain trout," *Salmo purpuratus* (not the "Rainbow trout" to which the name "mountain trout" has been recently applied in some Eastern States) and "Clark's trout," *S. clarkii*, which ranges from California to Alaska and Eastern Asia. Mr. B. B. Redding, of the California Fish Commission, sent a quantity of the singular "Viviparous perch," *Embiotoca lineata*, Grd., which contained young; Truckee River and Lake Tahoe trout; "Dolly Varden," *Salvelinus malma*, and "Rainbow trout," *Salmo iridea.* Messrs. M. T. Brewer & Co., 30, 32 J Street, Sacramento, sent specimens of the trout from Humbolt and other rivers, one of which weighed eleven pounds. None of the California specimens were under two pounds and from that to eleven; the Dolly Varden weighed four. Of fishes other than trout there were "pompano," *Trachynotus carolinus*, from the Gulf of Mexico; live Hackensack River smelts from Mr. Geo. Ricardo, of Hackensack, N. J., in aquaria; the first North River shad of the season, taken by N. B. Lent, at Croton Landing; and a fresh Nova Scotia salmon, while from the New York State hatchery came hybrid quinnat salmon and brook trout, and hybrid lake and brook trout.

The following is an alphabetical list of exhibitors of brook trout—the fish were all dead except where otherwise noted; James Annin, Jr., Caledonia, N. Y.—the smaller specimens were red bellied and in better color than the larger ones; W H. Bryant, Hempstead, L. I.; R. Burgess and Son, Bennington, Vt.; G. F. Chichester, Patchogue, L. I., small but nice; Thomas Clapham, Roslyn, L. I., young live trout of three months in jars; Wm. J. Cooper, Lancaster, Pa., the best table trout in the collection, high colored, plump and fine; South Side Sportsman's Club of Long Island, plump, handsome, light colored and white meated, quite large; Geo. H. Dickerman, New Hampton, N. H., nuber beauties; Geo. W. Etter, Lehmaster's, Pa.; Chas B. Fisher, Spring Valley, N. Y., wild trout, light color, plump and silvery, very handsome; J. Frank Gilbert, Plymouth, Mass., very handsome; Seth Green, N. Y. State Hatching Works, brook and rainbow trout of two and three years; John Gregory, Patchogue, L. I; M. Hogan, Quebec, very dark wild trout, thin and frozen; M. Height, Elmira, N. Y.; C. A. Hoxie, Carolina, R I, handsome trout, fed on liver and curd; J. W. Hoxie & Co., Carolina, R. I.; H. D. McGovern, Brooklyn, L. I., live trout of one and two years, in aquaria, dead trout—enemy of trout (*Belostoma Grandis*) and small carp; N. Clinton Miller, Brookhaven, L. I., large, dark and fine; Thomas Mowatt, Campbelltown, New Brunswick, wild trout, dark colored and plump; Geo. F. Parlow, New Bedford, Mass.; A. Rackon, Foster's Meadows, L. I., live trout in

aquaria; Willett H. Robinson, Patchogue, L. I., small trout; E. B. Rogers & Co., North Stonington, Conn., wild trout, plump; E. B. Sutton, Babylon, L. I.; Thompson Bro's., New Hope, Pa., very nice; C. Valentine, Brookhaven, L. I.; Seth Weeks, Corry, Pa.; E. W. Woodward, Manlius, N. Y., plump, spots yellowish. Messrs. Middleton and Carman also made a display of Long Island trout, live gold fish, and large striped bass flanked by an enormous lobster.

The fishing tackle dealers were all busy as they have been for weeks past, in fitting out the anglers for the opening of the season. Among the anglers who braved the season on Long Island, to have a cast at the trout on that dreary day which appalled all but the thoroughbreds, there went to South Oyster Bay, E. Lunitz, Joseph Stanley, of Hoboken, and Mr. Noble, of Brooklyn. To the South Side Club's waters, at Oakdale, near Islip, went Shepard F. Knapp, Thomas M. Bissett, Robert S. Bunting, John C. Congreve, W. R. Breese, George W. Hall, Charles F. Fearing, Peleg Hall of Newport, Harry Nichols, George H. Palmer, F. Shushard, James Benkard, Henry B. Hollins, Frank Johnson, John A. Lowery, Fred. R. Halsey, Roland Redmond, Mr. Pollock, H. R. Clark, John Halsey, Alexander Lutz, John Brice, Fred. De Luce, Mr. Simmons, Mr. Brand, Ed. Heylin, James Black and Ed. Matthews. Harry Miner went to Locust Grove. To C. F. Imbrie's and Mr. Wilbur's Green River preserve, at Sayville, went Andrew Clerk, James R. Thompson and others. Charles E. Strong, H. S. Fearing, George R. Fearing and many other members of the Suffolk Club enjoyed the day at their preserve near Patchogue.

To our notion the trout fishing will be more enjoyable a few weeks later, when the spring rains have warmed up the streams and started the vegetation.

BLACK BASS IN TENNESSEE.

CHATTANOOGA, Tenn.

EDITOR FOREST AND STREAM:

Men are at variance about just the kind of day, some contending for bright days, others for partially cloudy; but observation has taught me that a partially cloudy, sultry day is certainly better for very clear water, while a bright day is better suited for murky water. A south or southwest wind is the best. The best time of the year for fishing in our waters for bass is from the first of April till the first of June. They are more abundant at this season than at any other season of the year. They bite well, however, in August, September, October and November.

One of the finest bass I ever caught, weighing something over five pounds, I caught in the month of January. I was fishing at the mouth of a creek which flows into the Sequachee River, perched on the forks of a box elder tree, when I saw my float disappear and thought the current had washed my hook against a root or snag. I pulled gently and felt a fish; slacked and gave him time to gorge the bait; struck him and finding that I had a large one, and my position not admitting of playing him, I was compelled to cast my rod behind me to the shore, through the boughs of the tree, and wind him up hand over hand. He measured two feet from the tip of the under lip to the tip of the tail; eight inches across the broadest part, and the tail, when stretched, six inches, and his mouth, when stretched, twelve inches in circumference.

Last summer I went down into North Chicamauga gulch on a tour of inspection. I had left my tackle in Chattanooga. I secured on the mountain a small perch hook and some flax thread, and this, with a fly hook I happened to have in my pocket, was the extent of my outfit. We descended into the canyon, which is at least 800 feet deep, over the most rugged path I ever traversed, which to be appreciated must be experienced. On reaching the water, I found a dry sassafras pole, crooked and knotty, that had been washed down by the high water—for this stream rises in winter and dashes through the gorge with a rapidity and roar which echoed by the mountain sides reminds one of Niagara—and attaching my flax line, upon which I had knitted my hook to this pole, I put an angle worm and caught a large chub, from whose shiny side I severed a fin with a small piece of flesh attached, and with this I made a cast and soon had dangling in the air a beautiful black bass. One of my companions had rigged my fly hook much in the same manner as my own; and we followed the stream up, crossing bowlders and great slabs of stone and broken fragments, and we caught with these rude fixtures in four or five hours over forty black bass, averaging from eight to ten inches long. We saw larger fish than we took, but they were shy of our rude gear—some of which I captured subsequently, when accompanied by Mr. Charles Carpenter, Circuit Clerk of Sequachee, Mr. Pell Brown and Mr. Millsaps, of Walden's ridge, at which time we captured during the day one hundred black bass.

I mention this incident to show you how abundantly our streams are supplied with fish where they are unmolested, and how successfully fisheulture could be carried on in any part of our country; for where they exist in such great numbers naturally, artificially they may be made to increase more largely. H. H. SNEED.

LUTJANUS BLACKFORDII.—In speaking of the habits and mode of catching the little known "red-snapper," the New Orleans *Democrat* says: The red-snapper grounds are estimated to 700 miles. It is only a question of labor what amount can be caught. They are found in countless myriads at all seasons at a certain depth of water, say from fifty to eighty feet. They are caught with lines having a number of hooks, which are eagerly seized by the fish. It is pretty hard to draw up these lines with such a number of these fish attached to them. Windlasses are frequently used to draw them up. In a very few hours the wells of the smacks are filled with them. To prevent their floating and keep them alive until the port is reached, it is necessary to reduce their bulk by compressing the large excess of air accumulated in their long passage from the great depth of water in which they are caught to the surface. This is done by a small incision just below the gills, which operates as a vent through which the air escapes until the fish is reduced to its natural size, so that it sinks and keeps alive and healthy. It was through this simple suggestion that the red-snapper became a great commercial fish. Previously it was found difficult to bring them to market fresh. Now they can be bought in far greater abundance than any other fish. There is a large fleet and a large number of men engaged in fishery. As the value and cheapness of the red-snapper begins to be generally appreciated throughout the West, this industry will be greatly increased. With enterprise and labor, and cheap transportation, we believe that in time this business will equal in its proportions and extent the cod and mackerel fisheries of Massachusetts. The abundance of the red-snapper in the Gulf is equal, if not superior, to that of the cod off the coast of Newfoundland. It is a better fish than either, and involves less labor and expense in filling the demand and in transporting to any of the interior towns.

FISHING IN THE OSWEGO RIVER.—A correspondent from Fulton, N. Y., sends us an extract from a local paper giving a fishing record as follows: As the fishing season for 1880 has closed it will perhaps interest sportsmen to see the score of F. J. Van Valkenburg's fishing in the Oswego River, at Fulton. The season has been an unusually fine one for this kind of sport, and many strangers have been here during the summer to try for the first time their luck in the Oswego River, and all of them made good catches. Mr. Van Valkenburg's score for the season will show there are few places superior to the Oswego River for good fishing. He begins his record on the 20th of May, 1880, and closes it October 30. His fishing has been at odd times—at early morning, at night or evening—just as he could get away from business, and only once during the entire time has he devoted the entire day to the sport, and generally his fishing has been from one to two hours only at a time.

He has been out 72 times and at an average of two hours at a time or 144 hours of fishing, or twelve days of twelve hours each. During this time he has made an average catch of about 17 fish each trip out, or 102 fish for each twelve hours fishing.

The following is the score: Black bass, 532; Straubury bass, 16; silver bass, 10; rock bass, 405; pike, 10: pickerel, 5; catfish, 26; chubb, 209. Total, 1,213.

These fish were all taken, with the exception of 100, in the corporation limits. Of these 863 were taken by legitimate fly fishing. The balance of 350 were taken by bait. Those taken by bait were taken early in the spring and late in the fall. The bait used was the dobson or helgramite and no other. The best fly fishing is in the months of July and August.

A NEW BAIT.—Putnam, Conn.—As many of your readers are preparing their lines and would like to learn anything that would contribute to their success in trouting, and I have laid aside my rod and reel, I will impart a secret I have kept for years, and when fishing beside others they have wondered how it was that I was the most successful.

You have perhaps noticed the bright, shiny silvery hairs on a hen's neck after the feathers were plucked off. To make this bait, pluck off the feathers, but be careful not to pull out those hairs. Then cut round the neck up next the head, and also down next the breast. Then slip off the skin, and just when you want to fix the bait on the hook cut off a strip the size of a good-sized worm, and double it on over the hook, and you will see it is the most tempting bait you ever used, and it being tough, will hold on for an hour. I used to secure the neck skin whenever I could and salt them a little, and keep them moist until I wanted to use them. Try it, and see if it is not the best bait you ever saw (r used — G. F. W.

FISHING IN TENNESSEE.—Savannah, Tenn., March 21.—Fishing has begun this season several weeks earlier than last year. The bass bit well last week, and several fine strings were caught, the fish being large and in fine condition. No pike, perch or black perch have been caught yet. The fishing with nets and trot lines in the river has been almost nothing for the past two years. The fishermen are beginning to see that their habit of setting nets in the mouths of the creeks and catching all the fish that run up them to spawn has exterminated the supply. One of the most successful of the fishermen in past years has sold his nets and stopped fishing. The fish caught now are small, and so few in number as to make fishing a losing business. The supply of buffalo, drum and catfish, thought by many to be exhaustless, five or six years ago, now seems entirely destroyed. What we need is a good law, well enforced, for the protection of fish, or in a few years this portion of the State will be entirely deprived of this valuable and cheap supply of food.—WILL.

NO TROUTING HERE.—The Reading (Pa.) *Times* has the following: "The streams in the vicinity of Berkley, six miles north of Reading, have for some years been favorite resorts for trout-fishing by lovers of the sport residing in this city. In anticipation of the usual advent of fishermen on the 1st of April next, when the season for trouting will open, the farmers residing along the Maiden and Willow Creeks have been signing a notice this week, prohibiting all outsiders from coming on their lands to fish. Trespassers will be severely dealt with.

THE FLY CASTING TOURNAMENT.—Mr. Fred. B. Divine, of Utica, N. Y., writes to the prize committee of the New York State Association as follows: "I will donate two rods, a trout and a bass rod, all lancewood, silver mountings. Each rod to consist of one butt, two second joints (different weights), and three tips; also, extra bamboo tip case, making four different weights and hanging rods. The rods are put up in a handsome black walnut case, lined with velvet and bound with four bands of silver, as a prize in fly casting."

BASS FISHING IN THE POTOMAC.—We are now about to commence our spring fishing. We have the black bass in the Potomac, which affords us good angling; we have taken as much as 115 pounds in one day—myself and companion. It was in the fall of the year 1880, at Muddy Branch, in the Potomac. The best fishing is at the great falls of the Potomac, in early spring. The bass make up stream to the falls, and there they stay in eddies, as they cannot get over the falls. Any one wanting to have a good bass fish had better strike the falls. There is a good hotel, kept by John W. Carroll, who will take great pleasure in showing his guest how to catch large bass. This is a great resort for the anglers of Washington, D. C. It is only ten miles from the latter.—W. H. R.

TROUT TAILS STRIKE FLIES.—Charlestown, N. H. March 21.—Alluding to the quite extended discussion in your columns some time ago concerning the trout's use of its tail in striking the bait presented to it by the fly fisherman, allow me to say that there is no longer any doubt that the California trout at least (*Salmo iridea*) uses its tail intentionally for the purpose of disturbing and examining any unusual kind of food which it finds in the water. Long continued observation has confirmed this fact beyond a doubt. Very truly yours, LIVINGSTON STONE.

BEAVERHILL CLUB.—Two or three gentlemen will be admitted, upon introduction, into the Beaverhill Club, which this year has obtained sole control of the trout fishing in the famous Balsam Lake, and a continuous four miles of the headwaters of the stream. Inquiries should be addressed to Mr. George W. Van Siclen, 99 Nassau st., N. Y.

Fish Culture.

THE AMERICAN FISCULTURAL ASSOCIATION.

THE tenth annual meeting of the association took place at Fish Monger's Hall, Fulton Market, New York, on Wednesday and Thursday, March 30 and 31. The weather on the first day was cold, rainy and disagreeable, and the attendance was small, not over twenty-five persons being present, but an improvement in meterological conditions on the second day brought out about seventy-five. President Roosevelt was in the chair. Letters were read from Vice-President Page, now in England, on the importance of introducing shad into that country, and from Prof. Baird regretting inability to attend. While the shad question was before the house Mr. Mather was called to detail his experience in eating the German substitute for it, the maifisch, and Prof. Goode was asked for the specific differences. Mr. Mather then proposed an amendment to the constitution to permit honorary members to be elected by a two-thirds vote—carried. The same member then proposed for honorary membership Dr. Theodatus Garlick, of Bedford, O., the first American fisheulturist, which was also unanimously carried. The President then read a paper from Mr. Seth Green on "Hybridizing Fish" and other matters, which was followed by a discussion about the death of fish in winter when the ponds were closed by ice, in which several members took part.

A paper on the habits of the German carp was then read by Mr. H. D. McGovern, which was followed by a discussion as to whether the so-called carp of the Hudson was a true carp or not, which was negatively decided. Dr. Hudson described the three varieties of the German carp. The Secretary then read "A Contribution to the Biography of the Commercial Cod of Alaska," by Dr. Tarleton H. Bean. Prof. G. Brown Goode followed with "Epochs in the History of Fisheulture," in all lands, down to the present time. Mr. Phillips gave some statistics of the value of the sturgeon fisheries and the amount consumed in New York. The Treasurer's report was read and accepted and the following gentlemen were appointed a committee on nomination of officers for the year: Messrs. Hudson, Wilbur and Miller. Mr. Wilbur having left a few moments before, Mr. Evarts was substituted and the society adjourned for the day to eat Hackensack smelts at Mr. Blackford's invitation.

On Thursday at the opening of the session the nominating committee reported the following officers who, after a ballot, were elected: President, Robert B. Roosevelt; Vice-President, Geo. Shepard Page; Treasurer, E. G. Blackford; Corresponding Secretary, Barnet Phillips; Recording Secretary, James Annin, Jr. Executive Committee: Fred Mather, G. Brown Goode, Samuel Wilmot, Benjamin West, Thomas B. Ferguson, James Benkard, John B. Morgan.

The following new members joined: Robert T. Morris, David T. White, W. A. Wilcox, Charles Barrett, Charles Hewlett, Prof. A. O. Atwater, G. N. Woodruff, John D. Hicks, Samuel Whitney, Frank Endicott, Geo. H. Shafer, Abel Crook.

Mr. Barnet Phillips read a paper on the value of our edible fishes and included some statistics by Mr. George Lamphear. Mr. Mather read one on fishes which live in both salt and fresh water. Mr. James Annin, Jr., read a paper on "Poachers," including those wearing feathers, fur and clothing. Mr Blackford called attention to some specimens of viviparous perch sent by Mr. B. B. Redding, of San Francisco, and Mr. Mather opened one and found no young, although he found them in another specimen after the Association had adjourned and the trout show had closed. Alcoholic specimens of *Salmo purpuratus*, from Alaska, by Capt. L. A. Beardsley and Dr. T. H. Bean, were also shown, and then Prof. Goode read: "Some further light from Europe on the eel question." This started the usual argument, Mr. Roosevelt taking his old ground that the eels spawn in fresh water and the young go down stream, at least on his place on Long Island, Mr. Hewlitt taking the opposite view.

After this a messenger brought in a large package for Mr. Mather, which on opening, proved to be a diploma from Berlin recording the fact that a gold medal had been awarded him at the International Fishery Exhibition at Berlin, for his invention of the conical shad hatcher. It had been sent by Prof. Baird, whose letter announced the arrival of the medals and their readiness for distribution. A valuable paper was then read by Prof Atwater entitled: "The chemical composition and nutritive value of fish." Mr. Phillips then offered the following: Resolved: That the American Fish Cultural Association heartily appreciate the importance of the investigations upon the nutrive value of fish, now being carried on by Professor Atwater, the results of which have been in part communicated by him at its meetings in 1880 and 1881, and that, in the opinion of the members of the Association, the importance of these researches to the fish industries of the United States can scarcely be over-estimated. We would therefore urge upon the United States Commissioner of Fisheries the importance of encouraging these investigations to the fullest extent possible. Carried. Mr. Crook, President New York State Association for Protection of Fish and Game, then requested the members to send communications on subjects of interest in time for their June meeting, papers to be ready by the middle of May. Resolutions thanking the Fish Mongers Association for the use of the room were passed, and the meeting adjourned.

We will publish the papers, debates and proceedings in full in our succeeding issues.

SMELTS IN FRESH WATER.—Some time ago I observed in your columns an inquiry relative to the finding of smelts or "frostfish" in fresh water. The so-called frostfish is found in several lakes of the Fulton chain, in the "John Brown's Tract." Most visitors to that region have annually wondered at the sight of the old wooden weirs or "picket lines" set up the inlets. These fish run up the shoal inlets between those lakes in October, or about the period of the advent of frost—whence the peculiar title—at which time they are taken and salted down in considerable numbers by the guides for home use, and occasionally sent out to the adjoining settlements. The fish is a regular habitant of Second, Fourth and Eighth Lakes of the Fulton chain, and also

Racquette Lake, all deep waters. They seem to stick to the deeper lakes, except in the spawning season, and are a favorite dainty for the salmon trout, as I have frequently caught the latter all through the summer, both by trolling and deep fishing, which, on opening, almost invariably contained the remnants of frostfish. Early in 1862 a party of us camped at the head of Fourth Lake and set buoys for salmon trout. The suckers had not commenced to run and we had no bait, so sent back to Arnold's for a net; which we set well out in the lake, off the mouth of inlet. On hauling it the next morning we found the "net proceeds" comprised suckers and (tell it not, for we let them go), speckled trout, with some twenty frostfish. After baiting the buoys we found that the "lakers" bit best at the latter. The guides claim to prefer the fresh frostfish as an article of diet to any trout that swims. They run remarkably uniform in weight, say about one pound, and are somewhat slim in proportion to length, with bright white scales, and flesh of firm texture and light color. They have a long nose and are evidently a bottom fish. The guides say that the young, when hatched, immediately head for deep water, and reappear only to spawn when fully grown.

There is a physical oddity in the topographical distribution of this fish. Eighth Lake is entirely disconnected from Fourth Lake, or any others on the chain, and Racquette again has a long land barrier from any waters known to contain this finny denizen. A veteran visitant to the Northern Wilds, Mr. L. H. Redfield, of Syracuse, advances the theory that fish spawn are transported over long distances by being entangled in the feet of wild fowl, and also that mature fish are carried over intervening land through the agency of water spouts. Without the aid of some similar hypothesis, it would seem difficult to account for the presence of finny population in certain localities. I once stumbled upon a little bowl of a lake in that section, away up close to the crest of a mountain, swarming with trout and the course of its only outlet, a mile or two long, would have broken the neck of an Alpine goat to descend, and his very heart to look at the cataract ascent. There are two lakes near the south branch of Moose River, severally known as "Indian" and "Squaw" lakes, separated by high falls impassible for fish, while the lower pond literally teems with trout, yet my companion-trappers and guides asserted roundly that not a fish had ever been taken in the upper waters. From sheer contradictory "cussedness" I fished it for the best portion of three days with fly-bait—from shore and dug out—and with every possible device and captivation, without raising a fin. The water was clear, the season right and every surrounding apparently favorable, yet I couldn't circumvent the first sight of a scale from its crystaline depths. To discount my disgust, I caught a dozen or so *Salmo fontinalis* from the lower lake, and transported them safely into a camp-pail through the woods to the upper sheet, where I trust they have since followed the scriptural injunction in their new Eden. Eben! that I might revisit those shores next summer and see.—E. R. WILSON.

SHAD WANTED FOR THE NOTTOWAY.—It is interesting to note the interest taken by enlightened sportsmen in the propagation of a fish like the shad whose qualities as a sporting fish are very few but whose economic value is very great. A meeting of the Fish and Game Association of Dinwiddie County, Va., was held at Dinwiddie Court House on Monday, March 21, the President of the association, A. A. Hardy, being in the chair, and a large number of the members of the association and other citizens being present. The following resolutions were adopted by the association:

Resolved, by the Dinwiddie Fish and Game Association, that Charles J. Cabaniss, Esq., Dr. Hume Field, Dr. G. G. Zehmer, Maj. R. N. Nesbett and Dr. E. C. Powell, of said association, be, and they are hereby appointed a special committee to apply to Col. M. McDonald, Fish Commissioner of Virginia, or to Prof. Spencer Baird, the Fish Commissioner of the United States, or to both, for as many young shad as they furnish to be placed in the Little Nottoway River, near Nottoway Court House with a view to stocking the Nottoway River and its said tributary with said fish for the benefit of the people of Lunenburg, Nottoway, Brunswick, Dinwiddie, Greensville, Sussex and Southampton Counties living along said rivers.

To defray the necessary expense incident to this work, said committee are directed to open correspondence with citizens of each of said counties and ask them to raise a subscription of ten dollars ($10) for each county.

The people living along said streams are hereby earnestly requested to take all proper steps to cause the removal of fyke nets and other stationary traps and fishing apparatus calculated to retard the success of the proposed move to stock said streams with fish. Mill owners are also requested to proceed at once to erect proper fish ladders and not await legal proceedings to compel their erection.

The *Inter-Appeal* and the *Rural Messenger* of Petersburg, and the *Whig*, the *Dispatch* and the *State*, of Richmond, are requested to publish these resolutions.

On motion, Chas. J. Cabaniss, Esq., Dr. Hume Field and Dr. E. C. Powell were appointed a committee of three to raise contributions from the County of Dinwiddie under the second resolution.

On motion, the meeting adjourned. A. A. HARDY, *President*.

A. THEO. POWELL, *Secretary*.

THE GREAT FISHWAY ON THE JAMES.—We are watching with great interest the erection of the large McDonald fishway, at Bosher's Dam, on the James River, Va., because this will thoroughly test the new principle on which this fishway is constructed. Most other fishways have something in common with those which have preceded them and are merely a re-arrangement of old principles in a new form; but the McDonald fishway is an entirely original plan, which, if it works as beautifully on a large scale as it does in model, we have no hesitation in saying that it is the coming way. In the model the small jets of water from below perfectly check the rush of the water down the sluiceway without the formation of eddies. On the subject of the new one Col. McDonald writes to one of the officers of the Petersburg Fish and Game Association as follows:

Dear Sir—What with the preparation for the shad-hatching which I expect to carry on, on the Potomac, for the United States Commission and answering the continual inquiries in regard to fishways, my time is completely occupied. I hope to have a large fishway completed on James River, early in April, which will test the capabilities of my system as to shad and furnish a model for others to build by. To your good friends on the Upper Appomattox I can promise all the young shad they will move. Should each county or section make a small contribution the fund thus raised will go a great a great way, as the funds will go only to pay the expenses of messengers. We will have a formal opening of the fishway at Bosher's when all is ready. Due notice will be given in the Richmond papers and I hope that you or some representatives of your association will be there. Yours truly,

M. MCDONALD.

FISHCULTURAL LAW IN MINNESOTA.—142. An act to prevent the destruction of fish during the spawning season.

Be it enacted by the Legislature of the State of Minnesota.

Section 1. Whosoever willfully or intentionally kills, catches or takes any whitefish, trout or pike from the waters of Lake Superior, or streams entering therein, in the State of Minnesota, during the spawning season in each and every year, without first stripping the eggs or milt, as the case may be, from each white fish, trout or pike so killed, caught or taken, and without intermingling the same together so that said milt may impregnate said eggs, and then planting said eggs so impregnated in said lake or streams from which said white fish, trout or pike may be killed, caught or taken, shall be fined in the sum of ten dollars for each and every violation of this act.

Sec. 2. All prosecutions of this act shall be commenced within one month from the time such offence was committed, [and the same shall be a complaint under oath, before any justice of the peace in the county where the offence was committed], and all fines imposed and collected under this act shall be paid one-half to the complainant and one-half into the treasury of the county where such conviction takes place for the use of the common schools within said county.

Sec. 3. This act shall take effect and be in force from and after its passage.

Approved March 7, 1881.

FISHCULTURE IN CONNECTICUT. Moodus, Conn., March 21.—Just at present there is considerable interest being taken by some of our wideawake and enterprising citizens in the importation of carp and salmon, with which they are stocking the lakes and reservoirs in this vicinity. Recently Chas. H. Emily received from Fish Commissioner Baird, of Washington, a case of carp, which he used to good advantage, and Saturday, March 19, Wm. G. Greene and Mr. Emily received from the Connecticut fish commissioners 20,000 land-locked salmon. Mr. Emily placed 10,000 of the fish in Bashan Lake, and Mr. Greene stocked with the remainder the large reservoir east of his mill. The salmon will undoubtedly do well in Bashan Lake, for the water is deep and pure, and everything favorable for their rapid propagation. We hope the fish in Mr. Greene's reservoir will meet with success, but they have not as good facility for increasing as their brethren in the waters of Bashan Lake. We understand that Mr. D. B. Sexton intends to stock a small pond on his premises with carp. Let the good work go on. G. R. LECREVIER.

AFTER THE TROUT SHOW.—The entire collection of California specimens, including the Dolly Varden and Rainbow trout, with the collection sent by M. T. Brewer & Co., of Sacramento, being nine varieties of Cal. trout, were, after being exhibited half a day, sent by Mr. E. G. Blackford to Prof. Baird as a contribution to the National Museum collection. The cost of collecting and awarding these specimens, amounting to $121, was paid by Mr. Blackford mainly to enable the visitors to see as many different varieties as possible.

WHITFISH FRY FOR THE LAKES.—The U. S. Fish Commission has distributed the fry of the whitfish from the hatching station at Northville, Mich., in charge of Mr. Frank N. Clark, as follows:

IN LAKE MICHIGAN.

At Milwaukee, Wis..	1,000,000
At Waukegan, Ill	1,000,000
At Michigan City, Ind	1,000,000
At Ludington, Mich	2,000,000

IN LAKE HURON.

At Bay City, Mich	2,000,000
In Detroit River, at Detroit	1,000,000
In Lake Erie, at the Islands	1,250,000

No good health with thin, impure blood. Hop Bitters makes rich blood, good health and strength.

The Kennel.

FIXTURES.

April 7, 8, 9, 11, 12, at San Francisco, Cal. Pacific Coast Kennel Club's Bench Show, Mechanic's Pavilion. Col. Stuart M. Taylor, Secretary, No. 313 Montgomery st., San Francisco, Cal.

April 26, 27, 28 and 29, at New York City.—Westminster Kennel Club Fifth Annual Bench Show, American Institute Building, Third avenue and Sixty-third street. Entries close April 11. Charles Lincoln, Superintendent, No. 158 Fulton street, or P. O. Box 1,786, New York City.

September 1, at Pittsburgh, Pa. Close of entries Pennsylvania Field Trials. First Annual Derby. I. R. Stayton, Secretary, Pittsburgh, Pa.

October 1 at New York City. Close of entries Eastern Field Trials. Trials commence on Thanksgiving Day. Jacob Pentz, Secretary, P. O. Box 674, New York City.

THE SPANIEL.

[Reprinted from advance sheets of Vero Shaw's "Book of the Dog," furnished to the FOREST AND STREAM by the author, through the courtesy of Cassell, Petter, Galpin & Co., publishers, No. 596 Broadway, New York.]

THE SUSSEX SPANIEL.

WHEN a writer on dogs finds himself face to face with the spaniel family, he will be sure to find himself beset with a great difficulty when the place of honor has to be disposed of. For our own part we have been much perplexed by the rival claims of the Sussex, the Clumber and the black spaniel, for each of these varieties have their thick-and-thin supporters, who are rather inclined to look disparagingly upon the spaniels of other breeds. Breeders of the Clumber argue, and with some amount of reason, that the antiquity of their pet breed entitles it to great consideration, and add that the aristocratic associations of this breed of dog are solid proofs of the estimation with which it is regarded by the highest rank of sportsmen.

Supporters of the black spaniel, on the other side, maintain most stoutly that this variety to which they are devoting all their energies, is making such rapid strides toward perfection that it should be regarded as the most important member of the spaniel family, and base their claims to pre-eminence for it on the ground that there are better blacks now to be found than specimens of any other breed. This variety has certainly monopolized the prizes for spaniels in the classes where Clumbers and Sussex are unable to compete, and certainly fine specimens of the breed have often appeared upon the bench—specimens which, indeed, for quality and for symmetry, would rank second to no spaniels in existence; but still we are of the opinion that the Sussex is the spaniel which of all others should occupy the place of honor in a book on dogs. Its beauty in outline of the Sussex is very great, and the color, of a true "golden liver," is exceptional. Nor do his qualifications for regard end with those external points of elegence, for his value in covert shooting is gladly borne testimony to by those sportsmen who know the Sussex best and avail themselves of his services frequently.

Although this favorite breed of spaniel has for many years occupied a high position in the estimation of sportsmen, there was some years ago a very great chance of its becoming extinct, as the kennels at Rosehill, Sussex—the birthplace, so to speak of the breed—were depopulated by that dreadful canine scourge, dumb madness. About the year 1870, however, a few gentlemen, actuated by feelings of interest in the Sussex spaniel, set themselves to work to rescue the breed from the annihilation which threatened it, and to their energy and devotion the present Sussex mainly owes its existence at the time of writing. It must not be supposed, however, that certain so-called Sussex spaniels were not before the public previous to the action of these gentlemen; on the contrary, there were several animals about which laid claim to accurately represent the breed. The presence of these dogs, however, was injurious rather than beneficial to the pure-bred Sussex, for they did not fairly display his working capacities or the general beauty of his appearance. These impure specimens, moreover, were stumbling-blocks in the way of those who, as referred to above, had set themselves the self-imposed task of endeavoring to resuscitate the old Rosehill type, for their services were in many cases resorted to by breeders who were not familiar with their faults. They, therefore, crippled the action of these gentlemen, who knew the breed, and may be considered as responsible for many faults which are present in Sussex spaniels of the present day.

As might have been supposed, in 1870 there were several types of Sussex spaniel in existence—not that all were pure-bred, by any means; so perhaps it would be more proper if we said that there were several specimens of the breed in whose veins a large amount of the old Rosehill blood ran, but who bore the taint of foreign crosses in a small degree. It was, therefore, the task of these latter-day regenerators of the Sussex to select from these such animals as they could with some degree of safety mate with pure-bred specimens, and trust for good results. The efforts of these enthusiasts has certainly been crowned with the success it deserved, as we are now in the possession of a breed of Sussex spaniels which is rapidly approaching that uniformity of type which its admirers have had in view for ten years past. At first, of course, many prizes had to go—for lack of better being present—to dogs which would not win when pure-bred Sussex were on the bench, and this amounts at once for a slight diversity of types in 1873 and for a few seasons after. The pure-bred ones being so hard to find, and in so few hands, could not be seen at every show, and the judges had to do the best they could with the materials they had before them. This was in itself unfortunate for those who had the interests of the breed at heart; but still they persevered, and though they, in many instances, differed in opinion, the various owners kept on showing at all the leading exhibitions until some decided opinions began to be entertained among exhibitors as to the needs of the Sussex. As a sporting dog, all were agreed before the attempted revival of the breed took place, but upon his structural developments ideas differed, and do so still, in certain small details.

The names of two gentlemen—Mr. T. B. Bowers and Mr. A. W. Langdale—will always be identified with the movement in favor of the Sussex spaniel; and though the ideas of these two gentlemen are not identical, they deserve equal credit for what they have done in the interests of this valuable breed of sporting dog, and we are convinced that their exertions in its favor have earned them the unfeigned thanks of those interested in the Sussex spaniel. As we have been fortunate enough to secure the opinions of both these gentlemen, we propose producing them before adding any ideas of our own, and will therefore, without further delay, give the description forwarded to us by Mr. T. B. Bowers, of Hunt's Cross, Woolton, near Liverpool, which is as follows:

"The Sussex spaniel is beyond doubt one of the oldest branches of the spaniel family; yet, strange to say, notwithstanding its beauty, and capacity for rough work, it has never been common, though greatly esteemed and at one time jealously guarded by its fortunate possessors, and certainly this was no more than its deserts, for no dog is more intelligent or affectionate than the pure spaniel, and no spaniel is more acceptable to a sportsman in a rough country than the Sussex. Doubtless, in modern coverts, where game abounds, where rides are cut, and which can be hunted in any direction to suit the guns, the silent Clumber will show more sport; but in dense woods and dingles, where one must really hunt up the game, and where the dogs penetrate a mass of jungle which a man cannot face, then the silent Clumber would not be on serviceable as the Sussex, which is more active and capable of greater endurance.

"In order to have the perfection of sport in a wild country, the best teams of Sussex spaniels were trained to hunt feather only, and I greatly suspect that these old strains were purer spaniels than any we have now, for a great writer has said that spaniels have been crossed with beagles—hence their preference for fur to feather; and, indeed, in these days it almost sounds fabulous to be told that formerly spaniels existed which could readily be taught to quest only for feather; yet such well-broken teams did exist in Sussex; and such dogs might be had now by careful breeding, and if breakers were encouraged to devote to spaniel breaking that time of the year which is not required by the pointers and setters. But it might be well to remind any one who may desire to give the thing a trial that the Spaniels will in a great measure take their temper and disposition from the person with whom they are daily associated; so that to insure success, a quiet, even-tempered man must be selected as breaker. Great attention also must be devoted to the breeding of the dogs, for it must be borne in mind how difficult it is to get rid of any faulty formation or habit when once it runs through the blood of a kennel; in fact to get together a trustworthy team requires as much attention to their breeding and education as is devoted to setters and pointers.

"The Sussex spaniel was so jealously guarded that from one cause or another (the celebrated Rosehill spaniels were destroyed, owing to an outbreak of dumb madness) pure specimens became exceedingly rare, when, I believe, some wide land specimens crossed them with other strains of spaniels, and, being disappointed with the result, gave up the attempt to resuscitate their breed.

"In the year 1867 Mr. Thomas Burgess won first prize at Birmingham in each large-sized spaniel class with Sam and Flora, two liver-colored spaniels with white markings, and their breeder, Mr. John Hopcroft, maintained that they were directly descended from an old Sussex breed. Their appearance and origin caused a lengthy discussion in the press, and it was conclusively proved that, even if Mr. Hopcroft's strain had once been Sussex pure, some cross had been introduced, hence the liver-and-white specimens Sam and Flora.

"Sussex spaniels were also crossed with water spaniels, and again with the old breed of black cocker, by which means it is understood Mr. Bullock produced his well-known black spaniels Bob and Nellie (brother and sister), and these being mated together produced the liver-colored George, which had so many attributes of the Sussex spaniel.

"About this time (1872) a few lovers of the breed banded together, and obtained special classes at several shows. Birmingham followed suit in 1874, at which show the above-mentioned George was awarded second prize to Mr. Eddowes's Rufus. At this show I myself entered a protest against George, on the ground that, being the progeny of two black spaniels, he could not be a Sussex spaniel. The protest was disallowed, under the usual Birmingham regulation that, if possible, the decisions of the judges should resemble the laws of the Medes and Persians. However, the following year (1875) the same dog was exhibited at Birmingham and was put into my charge, and was passed unnoticed, since when he has been withdrawn from Sussex competitions.

"The chief prize-takers from this date down to the present time may, without egotism, be said to be my own Buckingham and Maude (of pure Rosehill blood;) and the progeny of this pair—viz: Mr. Saxby's (afterward Mr. Jacobs', lately deceased) Bachelor, my (now Mr. Bates') Lizzie, Rover III. (now Mr. Parkinson's,) and my (now Mr. Gamon's) Max, and my (now Mr. Hawkins') Duchess III.; Mr. Spurgin's Sydney and Major; Mr. Richardson's Boz, Beaver and Bess; and the Rev. W. Shield's Bess. In addition to these, which were all got by Buckingham or out of Maude, the most celebrated are Mr. A. W. Langdale's Lawyer, Mr. Salter's Chance and Chloe, the Rev. W. Shield's Rex, Dr. S. W. D. Williams' Laurie, Mr. Arthur Arnold's Dash, Mr. Gamon's Guy, Mr. Green's Guess and Chloe, Mr. Brandreth's Beatrice and Baroness, and my own Bastle and Beryl.

"In order to set on record the value of Sussex spaniels about this period, I give the prices obtained by myself for a draft of mine. Those sold were—Max, Rover III., Bastle, Bess, Duchess III., Lizzie and Beatrice, and the total amount realized was 440 guineas. In Sussex, the best specimens may still be found in the neighborhood of Hawkhurst and notably at Squire Egerton's.

"In general appearance the Sussex spaniel is lighter in build and higher on the leg than the Clumber.

"The head should be a good length, but broad as well, so should not appear long.

"The ears should not be large, and should be set on in front, rather above the level of the eyes; the feather on the ears should be straight and silky.

"The nostrils should be very large, and the lower jaw rather recede.

"The eyes, of a dark hazel color, should be deep set; and the expression should be one of supreme intelligence.

"The neck strong and slightly arched.

"The body long and deep, the ribs well sprung, the shoulders oblique, and the loin very broad.

"The legs rather longer than a Clumber's, bony and muscular; the front ones as straight as possible, the hind ones very much curved at the hips and hocks; the latter placed near the ground similar to a cat's.

"The feet large, round and well furnished with short hair.

"The tail should never, except under peculiar excitement, be carried above the level of the back. The correct carriage of the stern indicates purity of the breed both in the spaniel and the setter sooner than any other point.

"The coat (of a golden liver-color) should be smooth and very

donse, the feather should not be very long anywhere, and should on no account hand from the stern like a flag (as a Clumber's does), nor should it extend below the hocks.

"I am one who (for several reasons) does not believe in judging by points, but, for the benefit of those who do, I submit a code which I consider about right:

POSITIVE POINTS.

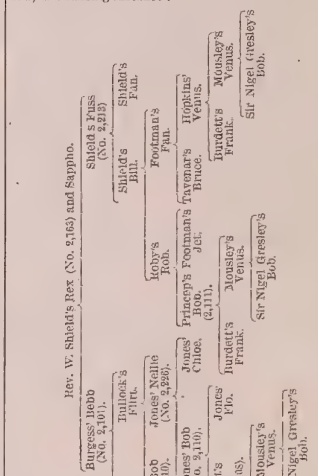
Head	10
Eyes	5
Ears	5
Neck	5
Body	15
Fore-legs	10
Hind-legs	15
Feet	10
Stern	5
Coat	10
General appearance	10
Total positive points	100

NEGATIVE POINTS.

Light-colored eyes or nose, or showing the hair	10
Ears with curly feather	10
Curly coat	10
Carriage of stern	20
A top-knot or any other color or markings but golden-liver, with or without a white frill	50
Total negative points	100

"The subject of your illustration, Romp, winner of first prize Crystal Palace, 1880, is by Mr. S. W. Marchant's old Rover (the sire of Buckingham and Maude) out of Flirt, by a Rosehill dog out of my champion Bustle. Marchant's Rover was by Sir P. Mickletwaite's Dash out of Mr. Weston's Fanny, by Mr. S. W. Marchant's Rover II. out of his Duchess II."

Mr. A. W. Langdale writes:



"There is a notion in Sussex, especially round Brighton, that liver-and-white is the orthodox Sussex spaniel color; but such an idea is ridiculed when we get further into the county. Old specimens are very bad to see, and worse to obtain. I have rambled all over Sussex and Kent in search of a *bona fide* specimen, and although I have been favored with a view, have never yet been able to obtain one, and call it all my own. Of the use of the dog there is no doubt. He is a noisy, babbling sort, that will raise a cock from the densest cover; and so natural does this babbling seem to the breed, that even when out at exercise if one gets off the high road into a meadow, that same moment, no matter how young, down go their heads, and out comes the music. The breed, since Sussex classes have been established, has brought out a number of different types, such as Bullock's George, Langdale's Lawyer, Salter's Chance, Spargin's Bebb and Pratt's General Prim, to say nothing of Max, Sweep, Rover III., Buckingham, Lady's-maid, Maude etc. Now, of these, George, Chance, Lawyer, General Prim, Rover III. and Bebb, are as different in their respective points as it is possible to conceive. Buckingham (late Mat) is called pure, and claims his descent from Rosehill, the place of all others, where this particular breed of spaniel is worshiped. Taking him for a pure specimen, we cannot for one moment believe that Bebb, Lawyer and George can be in the hunt. Lawyer is a most taking dog, and when he made his *debut* he was lauded to the skies, as the report in the *Live Stock Journal* of July 4, 1874, when he was shown in the name of Nep, ran as follows: 'He appears to be good in all points, golden-liver in color, with rare coat, good frill in front and a head so characteristic of his breed that he must prove a very dangerous rival to Bebb when they meet in the ring.' So it was when, at the next show, Mr. Lort, after a long and deliberate look over the class, actually placed this dog over Buckingham—a dog decidedly dark in color, and very pointer-coated, but, as I have written before, said to be true-bred. Maude (his sister, same litter) is of much the same stamp, and if she were a little longer in the head I don't know of one to beat her. Max, though having liver-and-white blood in him, is decidedly the most typical dog of the day, and barring the white star on Landseer's Spaniel and Pheasant picture, is as like that worthy draughtsman's specimen as it is possible to be. I will now give you what I consider to be the proper points of a Sussex spaniel. Taking the head first—it must be a large head, but not too narrow or long, yet not chumpy; in measurement I should for a dog say 8½ inches, a bitch half an inch less. The ears should be large, but not heavily feathered; no curl is admissible, and the shape of the ear is almost spoon-shaped, the mouth of the spoon at the top; they must be set low on the head. The eye is full, and always hazel-colored. The nose liver-colored and broad, not to say square. Fore-legs in many of the dogs I have been shown as pure bred are bowed, but why this should be I don't know. It will have the effect of making them slower at their work, and possibly that is desirable, but for appearance give me straight limbs. Let them be well-feathered in the fore-legs, but not so below the hocks in the hind. The weight for a dog I put at forty pounds, a bitch thirty-five pounds. His shape and make must be long, low and heavy; his stern must be docked to about ten inches, and when at work should be carried below the level of the back. Toes and feet should be firm and compact, and well fringed between the former. Color should be golden-liver—puce or a dead brown is decidedly objectionable—and the less white on the chest the better. Coat not curly, but pointer-coated nor yet setter but just between the two; a slight wave is not unbecoming."

After so much has been said in favor of the Sussex spaniel by the above two gentlemen, both of whom have worked so hard on its behalf, there can remain but little to be added by ourselves. The existence of a breed of spaniels which was identified with the county of Sussex was known in the days of Taplin and Scott, and Youatt, in his book, makes the following observations ament this variety, for he says: "The largest and best breed of springers is said to be in Sussex, and is much esteemed in the Wealds of that county." This is by far the handsomest compliment which has been paid the Sussex up to Youatt's time, and no doubt the writer meant what he said, for the inhabitants of Sussex undoubtedly set great store upon their breed of spaniels.

As in other varieties of dogs, color has been a fruitful cause for discussion among admirers of the Sussex spaniel, and though specimens of the correct shade have appeared in public, and won prizes at great shows, there have been objections raised against them on the ground that they were not pure Sussex; nor, indeed, were they such. The case of George, at Birmingham, which Mr. Bowers alludes to above, is a case in point, for here was a good liver-colored dog, the offspring of black parents. It must not, therefore, be by any means taken for granted that a spaniel is a pure-bred Sussex because his coat is of the desired color. This should be a rich golden liver—which does not in the smallest degree resemble the liver of the water spaniel, which is more of a puce color. The acquisition of the peculiar shade, so character istic of the Sussex, is one of the chief points for a breeder to have in view, and without it no admirer of this variety would be quite satisfied. Unfortunately, owing to the many vicissitudes through which the breed has passed, and the numerous crosses which have, in consequence, been resorted to, there are a number of dogs to be met with who do not possess the proper shade of color. Mention has, in fact, been made of dogs who, in many respects, resembled the true-bred Sussex, but who were disfigured by white markings, which would be fatal to their chances of success in competition, as breeders of this variety are singularly unanimous in their opinion upon the subject of color.

As a workman, the Sussex lays strong claim upon the sportsman. Though not mute, they are not "babblers," and in this respect, we must, with all due deference, differ from the opinion expressed above by Mr. A. W. Langdale, who describes him as a noisy, babbling dog. The Sussex throws his tongue in covert, but that he is noisy few of his supporters will, we think, be brought to admit. As regards his staying powers there is no question, for being lighter in the body, he is comparatively fresh when the heavier clumber is beaten, and this is no small point in the favor of a Sussex. On the other hand, the dog is inclined to be headstrong, and a little sulky at times, though this can generally be got over by judicious handling. This variety can also be broken to retrieve with ease, and when he is so used, his mouth is tender and he seldom injures the bird. With reference to his capacity for going to water, a well-known authority lately remarked to us "A Sussex is as good in water as he is on land."

With reference to this dog's unreliability in breeding truly, the pedigree of the well-known Sussex spaniel Rex, which we give below, is a striking instance:

Rex was a successful competitor in Sussex spaniel classes, and yet his sister, Lena, was a liver-grey-and-tan, and was shown by Mr. A. W. Langdale, at Norwich, as a Norfolk spaniel in 1874, upon which occasion she won first prize.

The dog we have selected for illustration is Mr. T. B. Bowers' Romp, which is alluded to by Mr. Bowers in his remarks upon the breed.

POINTS OF THE COCKER.

TORONTO, April 1, 1881.

Editor Forest and Stream:

As a member of the "Cocker Club Committee" I received an official communication asking my presence at a meeting to be held at the rooms of the Forester's Gun Club, in Buffalo, on the 30th ult. At very great personal inconvenience I resolved to attend, considering it a duty I owed to those who had done me the honor to elect me as one of the committee. Having received no intimation meantime of any intention to postpone the meeting, I proceeded on Wednesday morning to Buffalo, accompanied by an enthusiastic member of the club, who was desirous of making the personal acquaintance of the other members of the committee, and who also expected to meet a number of other members of the club, who, like himself, had taken a great interest in the construction of a proper standard for judging cockers. The president and members of the Forester's Club received us most kindly and treated us with warm and gentlemanly hospitality during our stay. These gentlemen, like myself, had no notice whatever of the meeting having been deferred, and spent the whole day in visiting the hotels and sending to the railway station to welcome the arrival of their expected guests. I have since learnt that through the gross negligence of the Telegraph Company a message sent to me on Tuesday, the 29th ult., did not reach my house until Wednesday morning after ten o'clock, by which time I had been traveling toward Buffalo for three hours, but I must say it was hardly courteous to the sportsmen of the Forester's Club, who had so generously tendered the use of their commodious and elegantly-furnished rooms to the committee, not to have informed them that the meeting had been put off.

It is a matter of much regret to me that the meeting did not take place as announced, and as my time is too valuable to be taken up in going on what may prove to be another wild goose chase, I propose to give the committee the benefit publicly of all the advice and opinions I intended to submit at the meeting, and to ask them to excuse me from acting, any longer as a member of the committee.

POINTS OF FIELD SPANIEL OR COCKER.

	Value.		Value.
1. Head	15	6. Legs	10
2. Ears	5	7. Feet	10
3. Shoulders		8. Color	5
neck and chest	15	9. Coat	10
4. Back and loins	10	10. Tail	5
5. Length	5	11. Symmetry	10
	50		50
Grand total	100.		

1st. Head-value 15—should be of medium size in proportion to body, skull of good length and broad with well defined brow, showing good brain capacity. Stop fairly marked. Eyes well apart, rather round in shape, of good size, but not too large, and neither protuberant nor sunken. Muzzle long and broad at nose, cut square off, not snipy. Jaws level, teeth large, sound and white. Lips rather inclined to be loose than tight. Nose should be black in black and black and white coated spaniels, and liver in liver or liver and white coated ones. It should be as large and spreading as possible, moist and with wide-opened nostrils.

2d. Ears—value 5—should be set on low, narrow at junction with head, gradually broadening and rounding off at end of leather; well covered with feather, which must be flat and smooth, not inclined to run into cords or ringlets. Ears should be flat to head, and should measure in a dog 30 lbs. weight, about 15 inches spread across head, not including feather. A good measurement of a dog weighing 30 lbs. weight, from tip to tip of feather, would be 20 inches. The leather should be thin, comparatively speaking, certainly not thick or coarse.

3rd. Shoulders, neck and chest, value 15. The neck should be long, so as easily to reach the ground when running. Shoulders muscular and sloping, but not loaded or coarse. Chest should be capacious and deep, but not wide enough to spread the elbows of the dog.

4th. Back and loins, value 10. The loins are very important, especially in a long-bodied dog. They must be muscular, and the ribs should have good spring and run well back. There should be no appearance of tucked-up flanks in a full-grown dog.

5th. Length, value 5. A cocker should never be less than twice his height at shoulder, from nose to setting on of tail. He may be twice and a quarter, but if so, the additional proportionate length should be in the neck, head and quarters, not in the couplings from shoulder to rump, unless there is great development of muscle in the loins.

6th. Legs, value 10. The forelegs should be short, strong in bone and muscle, straight, neither bent in or out at knee or elbow; posterns straight, short and strong; elbow well let down out of sloping shoulders. The hind legs should be strong and somewhat bent in the stifle; hocks straight, supple, and near the ground.

7th. Feet—value 10—should be of good size, round, knuckles well bent, and not too spreading. The soles should be furnished with hard, horny pads.

8th. Color, value 5. Any true spaniel color should be eligible, and beauty of marking should be taken into account.

9th. Coat—value 10—should be of good length, flat, with as little wave as possible. It should be bright and glossy, soft and silky. The feathers on legs, ears and tail should be rather more wavy and coarse in texture than the body coat. Feathers should be long and abundant on places above indicated, and also on the belly.

10th. Tail—value 5—should be docked to about a sixth of the entire length of the dog, from tip of nose to end of tail; *e. g.*, if a dog measures 36 inches from tip to tip, his tail should be six inches. It should carry it always low at work, not over the level of the back, and eagerly lash it when under excitement.

11th. Symmetry and general appearance, value 10. A cocker or field spaniel should be eminently a well-built, graceful and active dog. He should exhibit powers of endurance without heaviness or clumsiness, and activity and eager sprightliness, without want of solidity and strength

As to classifying animals at bench shows, I am in favor of making a small or cocker class for dogs under 30 lbs. weight, and a large class for field spaniels over that weight; the same scale of points to be used in judging both.

They should be judged by points, and if a dog is deficient in merit, he can be docked in negative points corresponding with the value he would have gained in positive points, if he were worthy of them. What I mean is this, that supposing a dog to have a perfect head, he can earn 15 points toward his total; and suppose another dog has a notoriously bad head, he will not only not get any points added, but the judge can deduct from his total 15 or as many points as he elects from his total score for his defects.

No dog should be awarded a first prize that does not score 80 points out of 100.

Your obedient servant,

J. F. KIRK.

WANTED—A WOODCHUCK DOG.

Editor of the Forest and Stream:

LONDON, Ont., March 26.

THE letter of "Lepus" in your last issue has struck a chord with the proper twang.

Why should not farmers as well as sportsmen take a pride in having dogs that are serviceable to them in their pursuits? Some correspondent asks if "Fox-terriers have ever been used in this country on ground-hogs?" I can answer on that point most confidently in the affirmative, and, as is said in the "ring," "they get their work in well."

The build of the fox-terrier is essentially that of a dog for going to earth—long, lean head, the shoulders fine and sloping, the chest deep but not broad, the back strong, the loins broad and powerful, the hind quarters strong and muscular; these, which are the essential points of the fox-terrier, all show that he is made for burrowing. As for being game, no one who ever possessed one can doubt it; even as puppies they will fight till death—as has happened often to the great loss of the owner. Mr. R. Gibson and Mr. Fox, both extensive breeders of these dogs here, have told me of numbers of ground-hogs killed on their farms by their terriers who do it on their own account; it is not necessary to be with them—they take to it naturally. They need no training, as by nature they go for anything with fur on it, from a mouse to a bear. So much for fox-terriers.

Another terrier whose build and disposition is very antagonistic to ground-hogs is the Irish terrier.

The Irish terrier, take him all around, is a hardier and stronger dog than the fox-terrier, and his coat is hard and rough and capable of bearing any amount of exposure without injury. He is built on the same plan exactly as the fox-terrier, and the good points of the one are those of the other—with the exception of the length of leg and the coat. They are only at home when they are at work digging, and never seem tired of it. I should say he would fill the want which "B. W." suffers from as well as the fox-terrier—if not better.

I have a youngster, five months old, whose only delight is digging after rats, and she can make the largest cat go like "greased lightning" at sight. The Irish terrier has only to be known to be appreciated. They are most affectionate and are good house dogs, and as companions have few equals in the dog world. In Ireland they are used as rabbit dogs with ferrets, and every poacher possesses one or two of them.

It is customary before purchasing one of them there to prove their gameness by what is called "drawing the badger." The badger is an animal a little larger than a ground-hog, but with a most punishing mouth, a tough, rough hide and coat, and most terrible feet, armed with powerful claws. The badger is placed in a barrel with a hole in it just large enough for the dog to get in; it is necessary for the dog to go in and bring the badger out, which if he is worth anything he will do in a very short time, but not without himself suffering to some extent. I think if "B. W." were to get a good Irish terrier he would not have many ground-hogs left to make "hog holes" to injure his horses.

M. B.

ST. MARY'S, March 28.

I would say to "Lepus" that the best known kind of dog for the above pest is the No. 1½ Newhouse steel trap. With a half dozen of these a farmer can very soon rid his farm of woodchucks—if he knows their holes. Let him place the trap in the hole with the spring outward. The chain should be about eighteen inches long, with swivel, and on one end of the chain should be a ring about one and a quarter inch in diameter. Draw the chain to one side of the hole, drive a stake through the ring. The stake should be so shaped that the ring cannot slip off, and should be driven down even with the surface of the ground. Now collect a small quantity of grass or leaves from near about the hole, and with it carefully cover trap and chain. Set traps about the middle of the day. In visiting the traps go no nearer than is necessary to see what you have got. If you have him, don't kill him near the hole, and when you want to reset your trap smoke it over a bunch of burning straw. The farmer will find this a much cheaper plan than with dogs, as well as a much surer one.—DUTCHMAN.

I see that "Lepus," asks for a dog to hunt out the ground hog from its holes. I querry very much if there is any suitable dog to be had for the purpose, but, having been an old "warrener" in days gone by on the slopes of the Welsh mountains, I have an idea that the common English ferret (*Mustela furo*, L.), would answer admirably. Let him first be "coped" (*i. e.*, muzzled), and then turn him in the burrow and let "B. W." and a friend or two be on hand with their "shooting irons," and I'll warrant they will have lots of fun, and the woodchuck family will be *non est* in a very short time. I presume that the English ferret is to be got in New York.

J. MATTHEW JONES.

Fern Ledge, Waterville, Kings Co., N. S.

In answer to "Lepus," asking for a woodchuck dog, I will say I have a black and tan terrier, weight 14 lbs., which can whip any woodchuck except the very largest. He does not go into the hole after them, but watches his chance when they are out of the hole, and then cuts off their retreat; and if too large to handle he snaps and barks at them, to keep them from the hole till help comes. He has caught as many as thirty-eight, and sixteen is the least he has caught any one season in the last six years. We have lots of chucks here in Orange County, and they are a perfect nuisance. SNEAK.

VAULABLE DOGS POISONED.—Some evil disposed persons administered poison last Saturday to two valuable dogs, owned by Major John W. Mahan, in the Dorchester district. One was probably the finest St. Bernard dog in the country. He weighed 182 pounds, measured six feet three inches from his nose to the tip of his tail, and was but two years and three months old. He was greatly admired by everybody, and was especially effectionate to children. Major Mahan was offered some months since $500 for him, but would not part with him. The other victim of malice was a dog of the pure Shepherd species, eight months old, and was a gift to the owner from inmates of the Soldiers' Home, at Togus, Me., the father and mother being owned by Gen. Tilton, Deputy Governor at that institution. Major Mahan has offered a reward for the conviction of the perpetrator of the act.—*Boston Journal.*

NEW YORK DOG SHOW.—The Westminster Kennel Club offers the following prizes for dogs that have run and been placed in any of the field trials that have been held in America:

A. For the best pointer dog; silver medal, suitably engraved. B. For the best pointer bitch; silver medal, suitably engraved. C. For the best English setter dog; silver medal, suitably engraved. D. For the best English setter bitch; silver medal, suitably engraved. E. For the best Irish setter dog; silver medal, suitably engraved. F. For the best Irish setter bitch; silver medal, suitably engraved. G. For the best black and tan setter; silver medal, suitably engraved.

The Westminster Kennel Club also offer the following additional prizes: H. For the best kennel of large-sized pointers, to consist of not less than five, owned by exhibitor; silver medal, suitably engraved. I. For the best kennel of small-sized pointers, to consist of not less than five, owned by exhibitor; silver medal, suitably engraved. J. For the best kennel of English setters, to consist of not less than five, owned by exhibitor; silver medal, suitably engraved. K. For the best kennel of Irish setters, to consist of not less than five, owned by exhibitor; silber medal, suitably engraved. L. For the best kennel of black and tan setters, to consist of not less than five, owned by exhibitor; silver medal, suitably engraved.

The following prizes are offered by a gentleman of New York City: M. For the best English setter dog, for stud purposes, to be competed for only by winners of not less than three first prizes; winnings of dog's previous get to be taken into consideration; cash, $25. N. For the best pure Laverack setter dog; cash, $25. O. For the best English setter dog, native or imported, to be competed for by the V. H. C. winners; cash, $25. P. For the best Irish setter dog, for stud purposes, to be competed for only by winners of not less than three first prizes; winnings of dog's previous get to be taken into consideration; cash, $25.

The following prizes are offered by A. H. Moore, Esq., of Philadelphia: Q. For the best mastiff, dog or bitch, a splendid plaque, painted by Mrs. A. B. Moore, of Philadelphia; value, $100. R. For the best brace of English setters (regardless of sex), to be competed for by dogs entered in the open classes only; donor does not compete; a handsome silver cup, value, $50. S. For the best brace of Irish setters (regaadless of sex), to be competed for by dogs entered in the open classes only; donor does not compete; a handsome silver cup, value, $50. T. For the best field spaniel, dog or bitch (donor does not compete); a handsome silver cup, value, $25. U. For the best Cocker spaniel, dog or bitch (donor does not compete); a handsome silver cup, value, $25. V. A fancier of greyhounds offers a solid silver cup, to be known as "The Chicago Field Greyhound Cup," to be awarded to the best greyhound dog or bitch that has taken a first prize at Springfield, New York, St. Louis, Philadelphia, Baltimore, Boston, Detroit, St. Paul or Pittsburgh, the owner of the winning dog to receive the cup and offer for competition at subsequent bench shows, on the same conditions. W. THE FOREST AND STREAM and ROD AND GUN offers a handsome silver mounted hunting horn for the best straight-legged beagle. X. THE FOREST AND STREAM and ROD AND GUN offers a handsome silver mounted hunting horn for the best bench-legged beagle. Y. A silver medal, suitably engraved, will be given for the best berghund dog or bitch. Also the following:

Special Prize.—For the best English setter dog or bitch, native or imported, to be competed for by the winners in their respective classes. One rich cut and engraved lemonade set, thirteen pieces, with winner's name engraved on same, value $25; presented by Geo. C. Sterling, Esq.

Mr. Paul DANA will judge mastiffs, St. Bernards, New Foundlands and Scotch Deerhounds. The entry list thus far compares favorably with that of last year.

Entries in special classes are free to all dogs entered in the regular classes. Entries close April 11th.

THOSE NERVOUS DOGS.—It is, perhaps, unfortunate for me that in my article on gun-shy dogs I used the expression, "Few breeders will deny that all blue-blooded dogs, the Laverack setter in particular, are, as a rule, excessively nervous," as it has brought forth an attack from Mr. Arnold Burges; and I confess I do not wish to enter into any newspaper controversy with him. I should have written *expressly on bird dogs*, for certainly this was my meaning, and did not intend to include the Irish and Gordon setter, or the pointer, unless they were much inbred. I followed my remark by mentioning the Laverack setter, which it is known is greatly inbred, and will not bear correction, as other breeds do, *and this I state on the authority of a letter to that effect on this subject, from Mr. Laverack to myself.*

Mr. Burges is not to be blamed for defending his blue bloods, but his attack on me is uncalled for. I will confess, if it will calm him, that I have not bred as many blue bloods as he has. I have shot over as many, and am content to allow my reputation as a judge of the work of a dog and capacity as a sportsman, to rest with those who have been in the field with me.

I do not aspire to be authority, and never intend to write a book on the dog, but do always compile from and comment upon any good work I come across. Mr. Burges certainly cannot charge me with copying a line from his many articles, which I ever strive to make practical and of interest to the lover of out-door sports.

In all kindness I would say to friend Borges, whom, by the bye, I have never seen but twice in my life, to attend to those attacks of nervous instability to which he seems to be a martyr, and accept the following prescription from the writer. Be content with my correction, and be calm. HOMO.

NATIONAL AMERICAN KENNEL CLUB DERBY.—The following entries have been made since March 31, for the second annual Derby:

Clarence K. Drane enters Dashing Novice, white, black and tan setter bitch by Dash II out of Novel, whelped July, 1880.

E. F. Stoddard enters Doctor Bob, red Irish setter dog by Bob out of Friend, whelped May 7, 1880.

E. F. Stoddard enters Lady Friend, red Irish setter bitch by Bob out of Feiend, whelped May 7, 1880.

Col. A. G. Sloo enters Glady's blue Belton setter bitch by Gladstone out of Nellie, whelped June 3, 1880.

W. E. Hughes enters Cliffe, blue Belton setter bitch by Gladstone out of Nellie, whelped June, 1880.

St. Louis Kennel Club enters Accident, liver and white pointer bitch by Faust out of Lassie, whelped Oct. 17, 1880.

St. Louis Kennel Club enters Mistake, liver and ticked pointer bitch by Bow out of June, whelped May 20, 1880.

Thirty entries have been received; will send full list for next issue.

JOS. H. DEW, Sec. N. A. K. C.

EASTERN FIELD TRIALS CLUB.—A meeting of the Executive Committee of this club was held on Thursday last, and the following programme was adopted for the coming meeting of 1881:

ROBIN'S ISLAND STAKES—Open to all puppies whelped on or after April 1, 1880.—Prizes—First, $150; second, $100; third, $50. Nominations to close positively on October 1. Forfeit, $5, with $10 additional to fill.

PICKING ON ALL AGED STAKES.—Open to all setters and pointers. Prizes—First, $250; second, $150; third, $50; Forfeit, $5, with $20 additional to fill. To this stake will be added by the club a special prize of $100, or a silver cup of equal value, at option of the winner, for the best pointer competing in the stakes. Stakes to close same as in the Robin's Island Stake.

MEMBERS STAKE.—Open only to members of the club, and each entry to be owned and handled by member making the entry. Prize to be a piece of silver plate of the value of $100, and the prize to be known as the Eastern Fields Trials Cup of 1881; entrance $10, payable at the time of nomination, and to close as in other stakes.

IMPORTED DOGS.—Mr. Robert Hume, of Orange Co., Va., has just returned from a visit to the other side, and has brought with him seven excellent dogs; four Dandie Dinmont terriers, a brace of fox terriers (dog and bitch) and a cocker spaniel dog. The dandies are of the best breed in England and cost Mr. Hume a long price. The fox terriers are of a well-known champion strain, the bitch being a hard one to beat and the cocker a remarkably well made animal, liver and white in color and perfectly trained. This remarkably fine lot will be entered in the forthcoming show.

AN ILLINOIS BIG ONE—Highland Park, Ill., March 14.—For several months past a number of notices of big dogs have appeared in the FOREST AND STREAM, and I contribute another. The dog to which I refer is owned by Mr. W. S. Crosby and is said to be a cross between a St. Bernard and Newfoundland. His color is black; length from tip to tip, 5 ft. 10 in.; measures round chest 3 ft. 9 in.; height at shoulder, 2 ft. 7 in.; weight, 193 lbs. I may be mistaken, but I think Highland Park is ahead.—EDWARD B. WESTON.

THE BENCH-LEGGED BEAGLE QUESTION—Rockville, Md., March 27.—*Editor Forest and Stream:* I notice an article from Mr. Pottinger Dorsey in your valuable paper of March 17.

In reference to the bench-legged beagle. We have them in our county (Montgomery), and I can say that they were first raised by Mr. Elsha Gaithe, New Unity, Md. They cannot be surpassed for rabbits. As Mr. Dorsey says, they are slow but sure for the game. They are sought after all over the State and also in Pennsylvania. They usually bring from $15 to $20 per pair. W. H B.

PURE LAVERACKS IN AMERICA.—At the time when we published "Leatherhead's" article from *Bell's Life* on the Pure Laverack setters in England, we determined, if possible, to prepare a similar list of those owned in this country. We have consulted on this subject a number of prominent breeders who most kindly responded, and we hope before long to be in a position to furnish our readers with a fairly correct list. We should be glad to hear on this subject from any gentlemen who own pure Laverack setters in this country.

MASTIFFS.—We understand that Mr. Charles E. Wallack is building on his place at Long Branch, N. J., some very extensive kennels after an approved English model. He is also importing some very fine young dogs from one of the first mastiff breeders and judges in England. This is a step in the right direction, and we shall be glad to see this noble breed improved in this country. Mr. Wallack is in constant correspondence with several of the highest authorities on this breed in England, and has for years made it a special study.

SAN FRANCISCO BENCH SHOW.—This dog show will be held at the Mechanics' Pavilion, San Francisco, Cal., under the auspices of the Pacific Coast Kennel Club, on April 7 to 12. Valuable prizes will be awarded to the best specimens in dogs in each class, also certificates of highly commended to dogs possessing superior qualities who fail to win first or second prize. And a very valuable special prize will be given to the most perfect specimen of dog or bitch in any class. Col. Stuart M. Taylor, Secretary, office 313 Montgomery st., San Francisco, Cal.

IMPORTED HARRIERS.—There has been lately imported from England, by Mr. S. Reed, of Louisville, Ky., two large-sized harriers, dog and bitch, Bluebill and Plandit, from the kennel of Dr. Gordon Stables, R. N. We are pleased to hear that they have given satisfaction and are greatly admired. It is supposed that dogs of this kind from good strains will improve the breed of foxhounds in the West.

GERMANTOWN HARE AND HOUNDS CLUB.—The Germantown Hare and Hounds Club will meet twice a month, beginning in April with a hunt in which a number of visitors from other clubs will participate.—"HOMO."

NOTICE.—In another column we insert the notice of a gentleman who wishes to secure a partner for the purpose of establishing a first-class kennel. References—Capt. M. C. Campbell and Capt. Jos. H. Dew.

AN ENGLISH ADVERTISER.—We call special attention to the advertisement of Mr. A.W. Langdale, and would advise our readers that are interested in the breeds of spaniels, to consult this gentleman, who is considered by Mr. Vero Shaw to be an eminent authority ity on the subject. Read what he says of the Sussex spaniel.

THE COCKER CLUB.—The advertised meeting of the Cocker Club did not take place at Buffalo.

KENNEL MANAGEMENT.

116 J. A., Barrytown, N. Y.—1. For beagle bitch use same treatment as recommended W. B. C. in issue of March 10; the cases are identical. 2. The injury sustained by your cocker bitch can only be relieved by rest and the bathing of the sprained leg with some strong stimulating liniment; this is all that can be done.

117 G. S., Buffalo, N. Y.—The dog should be carefully examined by some competent physician. It is impossible to arrive at a proper diagnosis of the case from the account given.

118 F. W. N., Poughkeepsie, N. Y.—My setter dog for three or four months has been troubled with his head, discharging from both ears, becoming excited will shake his head continually; when lying still does not trouble him. Don't seem to show any signs of pain. He scratches his ears occasionally; has no appetite I have been treating him internally and using a wash of Golden Seal, syringing his ears when diluted with water. As far as as I can see in his ears they appear to be all right. The difficulty is beyond sight A white spot came in his ear which has been removed for some time, but his ears still run and smell quite badly. He is very lively and apparently in good condition. He is a very fine young dog and I am quite anxious about him. What can I do for him? Ans. The dog has probably been overfed and not sufficiently exercised. Give him low diet for a while and plenty of exercise, also a little sulphur in his food once a day for a week and a purge or two of castor oil. Continue to use the lead lotion.

119 H. C., Mount Vernon, O.—My beagle hound dog two years old has a cold in his head. Keeps snuffling and sneezing Nose appears to be stopped up. When I hunted him last he would follow a trail O K, now he is no good. Will leave the track in five minutes. What shall I do for him? Ans. Try to promote his general health as much as possible by careful feeding and plenty of exercise, and give him two grains of quinine three times a day.

120 L. E. B., Westfield, Mass.—I have got a beagle puppy ten months old. About six weeks ago he had the distemper. The first two or three days he did not eat anything, but since then his appetite has been good and he has gotten along nicely and now, to all appearances, he is entirely well, with the exception that within about a week he has twice passed a thick clear substance, which was partly bloody. Ans. It is the natural result of distemper. If it continues give him a small teaspoonful of castor oil and ten drops of laudanum each night until it stops.

121 J. B. C., New York City.—I have a small cocker bitch which is now in heat. Several of my friends have advised me to cross her with a Blenheim spaniel. Would the cross be advisable? Ans. The cross is not a bad one made where direct breeding cannot be effected, but never cross when you can avoid it is the best motto.

KENNEL NOTES.

**** *Breeders and owners of dogs are invited to send memoranda of names claimed, bred, whelps, sales, etc., for insertion in this column. We make no charge for the publication of such notes; but request in each case the notice be made up in accordance with our form, that the name of both owner and dog be written legibly, or printed, and that the strain to which the animal belongs be distinctly stated.*

NAMES CLAIMED.

Shoo Fly—Messrs. Dan Stores & Son, Lebanon, N. H., claim the name of Shoo Fly for beagle bitch puppy out of Bess by Victor, purchased of Mr. N. Elmore.

Willie—Mr. J. B. Ladd, Martin, Tenn., claims the name of Willie for black and white ticked dog puppy, whelped June, 1880, out of Sanborn's Nellie by Gladstone.

Chip—Mr. John W. King, St. John, N. B., claims the name of Chip for his cocker spaniel puppy, presented to him by Mr. Ed. Boyce.

Domino—Mr. E. W. Jester, St. George's, Del., claims the name of Domino for solid white Italian greyhound dog puppy, whelped Feb. 2, 1881, out of his fawn bitch Italie by Rex.

Turk—Mr. Addison Child, Childwold, N. Y., claims the name of Turk for black, white and tan dog puppy, whelped Nov. 8, 1880, out of Lady by Don, Gordon setters imported by Mr. Ellerton L. Dorr, Boston, Mass.

Dick—Mr. W. H. Hobbs and Mr. Chas. Smyth, Lake City, Minn., claim the name of Dick for pointer puppy out of Fleet by Ranger, purchased of Mr. F. S. B. Dilley.

Douglas—Mr. F. B. Du Bois, Morristown, N. J., claims the name of Douglas for his seven-months-old foxhound puppy (white with tan spots) sired by imported Duke out of owner's Belle.

Kildare—Mr. F. B. Du Bois, of Morristown, N. J., claims the name of Kildare for his seven-months-old foxhound puppy by imported Duke out of owner's Belle.

Mag—Mr. C. L. Wrigley, Revere, Mass., claims the name of Mag for his red Irish setter bitch out of imported Ellien by champion Elcho.

Flirt—Mr. C. L. Wrigley, Revere, Mass., claims the name of Flirt for his lemon and white fox terrier bitch, whelped November 23, 1880, out of Trexsey by Ike.

NAMES CHANGED.

Lora to Lora Laverack—Mr. J. H. Henricks, Pittsburg, Pa., changes the name of his pure Laverack bitch from Lora to Lora Laverack, she by young Laverack out of Petrel II, recently purchased of Mr. F. G. Simpson, Ingersoll, Canada. Lora Laverack is entered for the Derby of 1881, and will be broken for that event by Mr. H. M. Short.

BRED.

Beauty-Coin—Mr. F. B. Fay's (Boston Mass.) Coin (Leicester-Rose) to Dr. Greenough's black and tan Beauty by Copeland's Shot out of Dr. Mason's Dora (Dorr's imported Dan and Greenough's Molly, she by Chance out of Mr. G. G. Hammond's Fan).

Curlew-Brag—Hornell Cocker Kennel's (Hornellsville, N. Y.,) liver cocker bitch Curlew to black Cocker Brag, March 10.

WHELPS.

Nagle's Cocker Bitch—Mr. Richard Nagles' (St. Johns, N. B.) cocker spaniel bitch whelped, March 18, sixteen puppies, all living and doing well, by Mr. M. J. McGill's dog.

Ruby—Mr. Richard Harper's (St. John, N. B.) Irish setter bitch Ruby whelped, March 17, eight puppies, four dogs and four bitches, by Clark's Dick.

Zita—Mr. Charles Klocke's (Pittsburgh, Pa.) setter bitch Zita, whelped, March 26, nine puppies, by King Dash.

Jano—Mr. Wm. Sargent, Jr.'s setter bitch Jano (Druid-Cubas) whelped, March 27, seven puppies, four dogs and three bitches, to Kentucky Kennel Club's Lotty. The whelps are black, white and tan.

Topsey—Mr. Jas. Lindsay's (Jersey City, N. J.,) Scotch collie bitch Topsey (imported Laddie-W. Lindsay's Moosey) whelped March 28, nine puppies, four dogs and five bitches by Rex, 1st, New York, 1880.

Princess—Hornell Cocker Kennel's (Mr. J. Otis Fellows, Hornellsville, N. Y.,) Princess whelped March 27, five puppies, two dogs and three bitches by same owner's black dog Brag.

Pansy—Hornell Cocker Kennel's (Mr. J. Otis Fellows, Hornellsville, N. Y.,) Pansy whelped March 27, seven puppies, four dogs and three bitches, four liver and three black by Lachlne Kennel's imported black spaniel Benedict.

SALES.

Snapshot II—Mr. C. H. Goodman, of Springfield, Mass., has sold to Dr. Lake cocker spaniel dog lemon and white pointer pup Snapshot II., by his Rattler (Ranger-Bess) out of his Zip (Snapshot-Fanny).

Peggie—Mr. M. L. Norton, of Greenbush, N. Y., has purchased of Mr. M. P. Bray, New Haven, Conn., the Irish red setter bitch Peggie, out of his pure Irish red setter Kate (imported from Ireland 1876), by Lincoln Holker's Dash. Peggie is all pure red, and very dark.

Regalia—Mr Horace Smith, of New York, has sold the lemon and white Sensation-Whisky bitch Regalia, formerly owned by Rev. R. G. Hamilton, of Troy, to Mr. George M. Tiffany, of Hartford, Conn. Regalia is four years old, very handsome and well broken. She is just from hard work in the South, and will be bred to Mr. Tiffany's Pete II., a fine large black poluter by Strong's Pete. Regalia will be among the cracks at the coming show.

Lora—Mr. J. H. Henricks, Pittsburgh, Pa., has purchased from Mr. F. G. Simpson, Ingersoll, Canada, the pure Laverack bitch Lora out of Petrel II. by Young Laverack.

Charley-Bessie Whelp—Mr. J. F. Kirk, of Toronto, Canada, has sold to Mr. W. B. Miles, Jr., New York, a black, white and ticked cocker puppy, whelped 14th of January, '81, by imported Charley out of imported Bessie.

Ray, Jr.—Mr. J. V. P. Hax, Baltimore, Md., has sold his Laverack setter Ray, Jr., to Mr. J. L. Thomas, Baltimore, Md. Ray, Jr., is out of Cartrue (Carlowitz-True) by King Edmund (Livingston's Ray-Nellie).

PRESENTATION.

Max-Gyp Whelp—Mr. Dave Gibson presented a cocker dog puppy to Mr. Wm. McDonough, St. Johns, N. B., out of his Gyp by Mr. O. T. Stone's Max.

IMPORTATIONS.

Greyhounds—Mr. J. R. Pierson, Buckingham, Bucks Co., Pa., has imported a brace of superior greyhounds, dog and bitch. Ben, spotted dog, 62 lbs., out of Cromorne. She by Peeping Tom out of Mausoleum. Fan, black bitch, 48 lbs., by Hero—Dancer out of Fenly. Fan is closely related to Master McFadden (brother of Master McGrath), Joan of Arc, Flora McDonald, Judge (winner of Waterloo Cup), Lady Dalton and Field Marshal. Fan is now in whelp to Ben.

DEATHS.

Lady Winsome—Mr. Isaac Yearsley, Jr., Coatesville, Pa., has lost his setter dog puppy Lady Winsome out of Countess by Count Noble.

Maida—Mr. C. T. Pierce, Brooklyn, N. Y., has lost his pointer bitch Maida.

Noisy—Mr. J. J. Donovan, Boston, Mass., has lost his Irish setter bitch puppy Noisy from inflammation of the bowels. Noisy out of Mag by Elcho, whelped December 9, 1880.

Thunderbolt—Some miscreant caused the death of a valuable setter dog belonging to Mr. J.F. Kirk, of Toronto, by throwing a piece of poisoned meat over the fence of the kennel. Thunderbolt was whelped on the 4th of May, 1878, and was bred by Mr. A. A. Finnis, of Rochester, out of Whirlwind by Arnold Burges' Druid. Whirlwind was by Burgundthal's Rake out of Smith's (of Strathroy) Fanny.

A GREAT BLUE HERON.—Newport, R. I., April 4.—Robert Allan, a lad thirteen years old, while gunning at Price's Neck on Saturday last, shot a large heron which measured six feet from tip to tip. I have never heard of one being shot before at this place. The right heron has three long dark feathers on its head, but this bird only had two and a very long bill and legs. Color of back, slate color; wings black; neck a shade lighter. He was shot in the daytime. What is it?

J. S. B.

The bird was no doubt a great blue heron (*Ardea herodias*), a species quite common in New England, and the largest of our herons.

OUR READERS should not confound our frequent contributor Major W. W. Merrill, of New Rochelle, N. Y., with the Major Merrill, who is sitting as a member of the Whittaker Court Martial.

Indigestion, weak stomach, irregularities of the bowels, cannot exist when Hop Bitters are used.

Rifle and Trap Shooting.

RANGE AND GALLERY.

ALBANY, N. Y., March 31.—Last year the Directors of the Rensselaer Wyck Range offered a life membership as a prize at 200 yards. A fair allowance was made to men using a military rifle, in order to induce them to enter the competitions on an equal footing with the smooth-bore men. Three competitions were shot last season, and the cold weather prevented a record of scores, and they were looking for second or third place, as the men winning them are paid a percentage of the entrance money. J. L. Miles was shooting his military, and on his sixth round had made twenty-seven. Another centre would give him thirty-one, which, with the allowance, would give him thirty-five, and make him a winner. He wanted second place, and made an inner, which he considered would make him safe for second place. Mr. R. L. Green, however, went after him and succeeded in wresting second place from him. The scores in detail were as follows:

Leonard Gery, R S	5 4 4 5 4 4 5 5—32
Royal L Green, S M, *.....	4 4 5 5 4 5 5 5—32
James I Miles, S M, 2.....	4 5 5 5 4 5 5 4—32
William E Frith, Bal S.....	5 4 4 5 4 4 5 5—31
A Carpenter, S M, *2.....	5 4 4 5 4 4 4 4—31
Theodore Mosher, Bal S.....	4 5 4 5 5 4 5 4—31
G H Charles, Bal S.....	4 4 4 4 4 5 5 5—29

*Allowance to military rifles.

BOSTON GALLERIES.—At the galleries the March matches have closed, and new ones for April have been started. At the Mammoth gallery Messrs. Pratt and Norcross have been recorded with their highest scores as perfect ties for the past week, the latter gaining the slightest advantage until last night, when Mr. Norcross succeeded in putting in a good 47, displacing a 46, and putting him at the front. The winning scores of March in all matches stand as follows:

Amateur Badge Match.

W M Norcross..37	37 37 38	A C Maynard..	36 36 36 37 37—182
M L Pratt.....37	37 37 37	Steve Williams	37 35 35 35 36—176

Experts' Match.

N W Arnold.....38	38 39 39	J H Williams	37 37 37 37—187
J Merrill.....37	38 38 38	C R Bartlett	36 36 37 37 37—183
W H Harrison..37	38 38 38		

Pistol Match.

J H Williams.....75	78 73	Elihu Wilder	67 68 71—205
F J Rabbeth.....67	70 71		

April 1 began a new set of rifle matches. The limited badge match, no one allowed to enter who has scored more than 186, or who has ever won a prize in any gallery; the amateur badge match, no one allowed to enter who has ever made more than 176; an amateur pistol match, no one who has ever won a prize in any gallery allowed to enter. The experts' pistol match, with three cash prizes, and the FOREST AND STREAM match for the elegant meerschaum pipe, will also continue through the month of April. Conditions in all rifle matches: Rounds 8, five scores to win, or a possible 200, off-hand, range 150 feet. Pistol matches: Rounds 8, three scores to win, or a possible 238, position off-hand, range 50 feet.

At the Magnolia gallery the shooting has been very sharp in all the matches. The prizes and totals in last month's contest are as follows:

J Merrill.....50	48 48 49 50—245	M Drew	234
O A Gross.....49	50 46 48 50—243	E Walters	233
E Harris.....48	49 49 48 49—243	J J Ross	233
J Ames.....48	48 48 49 48—241	J B Fellows	232
S Peng.....48	48 48 48 48—240	W A Noyes	232
C A Maynard..48	48 48 48 48—240	F I Twiss	232
C Albert.....48	48 48 48 48—240	A Law	231
E L Dodge	238	W M Merrill	229
H Mayo	237	H Sinclair	221
C Jones	230		

Badge Match.

C A Maynard	49 49 50 49 49 49 49 49 50 49—190		
M Drew	48 48 48 49 49 48 48 49 49 48—485		

Pistol Match.

C Dunn.....101	103 103 104—411	J Mayo	99 98 101 92—390
J H Williams..102	103 104	J Ames	97 89 100	1—290

April 1 began a new badge match, with the following conditions: Ten shots, five scores to win, or possible 250 to count as one continuous score. The new pistol match which opens with 50 shot on the ready measurement target, with any 22 calibre pistol not to exceed ten inches in the barrel. The conditions of the Three scores to win, 10 shots, 75 feet, each competitor to stand free from rest or brace and to use but one arm. The FOREST AND STREAM match will close April 30. The leading contestant up to date is Mr. Arthur, who is recorded with the nine score at total 245.

BOSTON, Mass., April 2.—To-day was a cold day for riflemen, and the few that sought Walnut Hill range found the wind blew a gale from the northwest, making it almost impossible to hold on the target. The best scores are appended:

Record Match (Massachusetts Target).

A C Gould	10 11 10 10 12 9 12—74
G Warren	7 12 10 12 12 10 11—74
C A Gay	11 12 10 1 11 8 9—70
A B Pratt	10 10 10 12 9 8 10—69
G F Perkins	11 11 8 9 10 10 8—69
J J Rabbeth	9 9 11 10 10 8—67
R J Fish	10 9 7 10 9 11 9—71

Record Match (Creedmoor).

J B Fellows	5 5 5 4 5 4 5 4 4 4—45
F Johnson	5 4 4 4 5 4 4 4 5 4—44
R B Drew	4 4 4 5 4 4 4 4 5 4—42

Badge Match No. 2.

J S Bennet	5 4 4 4 4 4 5 5 5 4—44
B James	4 4 4 5 4 5 4 4 5 4—43

The following rifle clubs will hold extra shoots on Fast Day, April 8: Massachusetts Association, Walnut Hill, four matches, at 200 yards; Medford Amateur Association, Belleville range, matches at 200 yards; Auburn Rifle Club (Auburn, Mass.), match at 200 yards; also Canton match at 500 yards. Schutzen corps, Beachmont, matches on Massachusetts target (off-hand and rest).

ZETTLER RIFLE CLUB.—New York, April 2.—At the Zettler gallery the plank target match closed this evening, and the following competitors received prizes: 1st prize, Wm. Klein, pair sealskin gloves; 2d, M. B. Engel, half dozen silver spoons; 3d, George Lauer, $5 cash; 4th, J. Binnenberg, toilet set; 5th, Chas. Judson, pedometer; 6th, D. Miller, fishing rod; 7th, Jake Levy, revolver; 8th, H. Holges, revolver; 9th, John Dutil, gold pen and pencil; 10th, L. H. Grohman, horseshoe tie stand.

The bullseye target.—The most bullseyes: H. Hoyles; 2d, A. Siebeneichen; 3d, Hugo Siebeneichen.

The next match will be shot on the Everybody's target, open to all comers; entry 25 cents; match to commence on April 4; 350 chances to close.

NEW YORK STATE ASSOCIATION.—Orders for a large number of prizes have been received, and in addition to those which we have published we hear of the following: Joseph S. Finck & Co., Golden Wedding Distillery, have presented $50 cash; John Gibson's Son & Co., $100 cash; Clement Hall & Co., diamond, through Mr. Charles E. Fitch; one of the firm, $100 cash; Edwin S. Harris, New York, gives one English corduroy hunting suit; James F. Marston presents one split bamboo rod with reel, also one trunk rod, reel and line, silver mounted and in appropriate cases; W. W. Greener donates, through Henry C. Squires, his American agent, a hammerless gun made especially for this occasion; Schoverling, Daly & Gales present one of their diamond grade guns. Some of the regiments of the State National Guard have expressed a wish to join the State Association and compete for prizes in shooting. The committee have the matter under consideration.

THE PARKER GUN.—Mr. J. C. Haskell, of Lynn, Mass., who on the 22d ult. broke 500 balls in an actual shooting time of 22 min. 35 sec., and, with rest, consuming 24 min. 15 sec., is desirous of hearing whether any club can show a better record for quick work, and if this record has been beaten he thinks he can do a little better even. He accomplished this feat without a single miss're or baulk of any kind, and this speaks strongly for the merits of American guns and especially of the Parker gun used on this occasion.

MEDFORD, Mass., April 2.—In the shooting of the Medford Amateur Rifle Association, at Bellevue range, some capital work has been recorded in the Silverware matchr. The conditions of the match were that members of the associations should be handicapped on their scores, all non-members to state their highest recorded score, and be handicapped by the directors. Up to date Mr. J. K. Teel heads the list, a first winner, his handicap being added. Mr. Charles is second with an almost unprecedented score of five 48s, and Mr. Frank Hollis third with four 48s and one 48. Mr. A. G. Gould has also an elegant score, a total of 210. The following summary gives the winners in their respective positions. There was also a general prize of ten silver dollars to the marksman making the largest score each day the most number of times, the same handicap list to be used. So far J. K. Teel stands; W. Charles, 3; Grillin, 1; R. Abbott, 1; Pollard, 1; Ames, 1, and Jacobs, 1.

J K Teel	46 47 47 47 48—246	N P Ames	45 46 44 45 46—227
W Charles	49 49 49 49 49—245	A B Archer	46 46 47 45 45—226
F Hollis	49 48 48 49 49—244	E F Richardson	46 43 47 48 46—225
A G Gould	46 46 46 47 47—240	R Abbott	44 45 49 45 43—223
W Jacobs	45 45 46 46 48—230	D I Russell	43 45 45 45 45—223
H Withington	46 46 45 45 47—229	E Whittier	44 44 44 45 44—221
A Whitney	46 45 46 45 46—228	F L Claflin	47 41 42 41 42—228
A W Webb	46 45 45 45 46—227	A J Green	43 44 44 43 43—228

HOPKINTON, Mass., March 31.—The Sportsman's Club have had another practice at the house on the Wardville road. A rotary was used. The principal scores made out of a possible 29 were as follows:

W G Stone	17
C Rose	16
D Dorchester, Jr	15
S A Smith	12

Out of a possible 35 the following is the record:

W G Stone	28
D Dorchester, Jr	25

C H Rose.....28

THE NEXT practice and trial of the club occurs on Thursday, April 7, at the same place.

GARDNER, Mass., March 31.—The Gardner sportsmen have had a large attendance at their last practice at Hackmatack range. Two score of 10 shots each was allotted to each man. Distance 200 yards, off-hand, inch ring and Creedmoor target. The score tells the story:

	R	C	R	C	Totals
G F Ellsworth	91	46	91	45	182—91
J N Dodge	86	46	85	45	171—91
H Fredd	75	44	87	46	162—90

Jee Norwood	53	40	57	43	113—83

A NEW RIFLE.—Mr. F. J. Rabbeth, the executive officer of the Massachusetts Rifle Association, has invented a new long-range gun, which is said to be an entirely new departure from the rifles now in use. The main idea is to place as much weight and length as possible into the barrel, reducing all other parts to a minimum. The weight of the barrel is 8¾ pounds, the all other parts, breach and mechanism, 1¼ pounds. The heaviest barrels in other rifles are from six to seven pounds, the old Remington barrel weighing six pounds. Another feature of this new invention is that the barrel is in line with the shoulder, so that the support is in direct line with the bore, having no tendency to throw up the muzzle by the recoil. Another special advantage is, that should a cartridge-head burst the breach mechanism is gas-tight; therefore there can be no danger and no loss of power or force by such an accident. Another improved idea is that the wind gauge is placed on the rear sight, and the front sight is so arranged that no covering is required and the marksman is not obliged to move from his prone position to adjust them for sudden changes. The new rifle was shot on the 19th., by Mr. Rabbeth with good results for the first time, at all ranges, and he was congratulated by his brother riflemen upon his new departure.

STOCKTON RIFLE RANGE, N. J.—The programme for April, opening April 9, is as follows; April 9, No. 1—Short-range match, 200 yards: open to all; ten prizes. No. 2—Short-range team match; open to teams of five; 200 yards; prize, silver trophy. No. 3—Ballard match; open to all; 500 and 600 yards; prize, Ballard rifle. No. 4—Long-range match; open to all; 1,000 yards; prize, gold watch. April 13—Champion short-range match; open to all; 200 yards; prize, gold badge. April 16, No. 1—Sharps match for military; open to all; 200 yards. No. 2—Champion Marksmen's Badge match for 1881; open to First Brigade, N. G. N. J., 200 and 500 yards. April 20—Remington match; open to all; 200 yards. April 23—Mid-range team match; open to teams of five; 500 yards; prize, silver trophy. April 27—E. Burd Grubb military team match; open to teams of ten in Second Brigade, N. J. S. N. J.; 200 and 500 yards; prize, French mantel clock. April 30—Champion Marksmen's Badge 1881; open to members of Second Brigade; 200 and 500 yards.

The season at Creedmoor will open between the middle and end of April.

NEWARK, N. J.—*March* 25.—The army of gallery shots in this city are just now very busy and all sorts of club and individual contests are being run this way. The Harrards and Washingtons contested the first of a series of five matches, at the range of the first named club, with the following score: Washington—B. Pettigrove, 43; Charles Beckley, 35; Henry Wolff, 44; Frank Roberts, 46; J. Carmichael, 45; P. L. Sommer, 43; C. H. Townsend, 44; John Copperswith, 47; John Beyer, 48; H. Marsh, 45—total, 410. Barnard—C. Meissel, 42; W. Burtchell, 44; H. Van Buren, 43; Willet, 42; A. A. Baldwin, 46; J. Rowe, 46; S. T. Simmons, 43; T. Achison, 43—total, 425. The next match will be shot at Bayer's range.

A. H. Bogardus challenges Mr. John C. Haskell of the Lynn Central Club to shot a match near Boston at 500 glass balls, and bets from $100 to $500 that he (Haskell) cannot, under the same conditions as he shot, perform the feat. Conditions: To start the match together at the crack of the first gun shot.

THE TRAP.

BALTIMORE, Md., March 23.—The following pigeon matches were shot to-day at McKnight's Upper Canton House, near this city. Miles Johnson of New Jersey, Frank Heintz of Philadelphia, Hon. A. H. Ackley of Louisiana, and E. L. Mills of the Treasury Department, Washington, D. C., were among the visiting sportsmen in attendance, while Messrs. Ritter and Kell represented Baltimore. The birds provided for the occasion were a fine lot, and the wind being strong and gusty, away from the traps. Mr. Mills, of Washington, carried off the honors, winning a majority of the prizes, and making the highest average during the day's shooting, the relative score being as follows:

Mr. Mills killed 92 out of 104; missed 12. Mr. Ackley killed 87 out of 89; missed 13. Mr. Heintz killed 81 out of 76; missed 15; Mr. Johnson killed 53 out of 71; missed 18.

Following are the scores:

First Match—$5 entrance, 5 birds, 25 yards, one money.

Ackley, 5; Johnson, 4; Mills, 5; Heintz, 4. Purse $20. Divided by Johnson and Heintz.

Second Match—Same conditions.

Ackley, 5; Johnson withdrew; Mills, 4; Heintz, 5. Purse $20. Won by Heintz on tie.

Third Match—Same conditions.

Ackley, 5; Johnson, 5; Mills, 5; Heintz, 3. Purse $20. Won by Johnson on tie.

Fourth Match—Same conditions.

Ackley, 5; Johnson, 3; Mills, 5; Heintz withdrew. Purse $20. Divided by Mills and Ackley.

Fifth Match—Same conditions.

Ackley withdrew; Johnson withdrew; Mills, 5; Heintz withdrew; Ritter, 5. Purse $25. Divided by Mills and Ritter.

Sixth Match—Same conditions.

Ackley, 5; Johnson withdrew; Mills, 5; Heintz, 5; Ritter withdrew. Purse $25. Divided by Mills and Heintz killing three birds each on tie.

Seventh Match—Same conditions.

Ackley, 5; Johnson withdrew; Mills, 5; Ritter withdrew; Heintz withdrew. Purse $25. Divided by Mills and Ackley.

Eighth Match—Same conditions.

Ackley, 5; Johnson withdrew; Mills, 5; Ritter, 5; Heintz withdrew. Purse $25. Divided by Mills and Ackley after tie shooting.

Ninth Match—Same conditions.

Ackley, 5; Johnson, 5; Mills, 5; Ritter, 5; Heintz withdrew; Kell, 5. Purse $30. Won by Kell killing 4 on tie.

Tenth Match—$10 entrance, 10 birds.

Ackley, 7; Mills, 9; Ritter, 9; Kell, 2; Heintz, 5; Johnson, 2. Purse, $60. Divided even by Mills and Ritter.

Eleventh Match—$5 entrance, 5 birds, 25 yards; purse to be divided as in match No. 10.

Ackley, 5; Mills, 5; Ritter withdrew; Johnson, 5; Heintz, 3; Kell withdrew. Purse $30. Divided by Mills and Johnson.

Twelfth Match—Same conditions.

Ackley, 4; Mills, 4; Ritter, 4; Johnson, 4; Heintz, 3; Kell, 5. Kell first prize, $18; Johnson second prize, $12, killing 6 on tie.

Thirteenth Match—$2 freeze-out, 31 yards.

Mills	1 1 1 1 1 1 1 1 1 0	Wertsner	1 1 1 0
Ritter	1 1 1 1 1 1 1 1 1 0	Bancroft	1 1 1 1 1 0
Kell	1 1 1 1 1 0	H. Sell	1 0
Johnson	1 1 1 1 1 1 1 1 1 1	Engle	1 1 0
Heintz	1 1 1 1 1 1 1 1 1 1		

Purse $18. Divided by Johnson and Kleintz.

Fourteenth Match—$2 freeze-out, 31 yards.

Mills, 0; Johnson, 1; Kell, 0; Kleintz, 1; Bancroft, 0. Purse $10. Divided by Johnson and Kleintz.

Fifteenth Match—Same conditions.

Mills, 4; Johnson, 7; Kell, 1; Kleintz, 5; Bancroft, 6. Purse $10. Won by Bancroft.

This ended a very pleasant day's sport. B.

N. Y. GUN CLUB, April 2.—The attraction of the regular shoot of the New York Gun Club to-day was the contest for the Club Fund Cup, which, under the conditions of presentation, is to be awarded to the competitor winning it twice consecutively. It has already been shot for five times, the winners being W. M. Edmunds, G. C. Howard, E. White, L. Van Buren and E. M. Hammond. Mr. Hammond, the last winner, was recognized as a strong shooter, and eleven entered for last contest against him. The birds provided were good, and a strong wind blowing diagonally across the field greatly aided them in their flight, but some good scores were made, and Mr. Benjamin carried off the cup by killing nine out of ten. Mr. Hammond was only one behind, and lost dead out of seventeen with breaking a tie. The following are the scores made during the afternoon:

New York Gun Club, Bergen Point, N. J., April 2.—Sweepstakes at seven birds: ties shot off at miss and go out.

Dexter.....26 yards	0 1 1 1 1 0 1—1 1 0 1 —8
Hallman.....24	1 1 1 1 1 1 1—1 1 ● 0 —7
Howard.....26	1 0 1 1 1 e—1 0 —6
White.....28	1 0 1 1 1 0 1—0 —5
Benjamin.....24	0 1 1 1 0 : —4
Arthur.....25	1 0 0 1 1 0 1 : —4
Hammond.....26	0 1 0 1 1 0 0 —3

Same Day.—The Club Fund Cup, value $100; entry $1; 10 birds; to be awarded to that competitor who shall first win it twice consecutively; ties shot off at 1 bird; all who are handicapped at 25 yards or under shall shoot at 25 yards; all who are handicapped at 27 or 28 yards shall shoot at 28 yards; all who are handicapped beyond 28 yards shall shoot at 29 yards. The distance at which a competitor stands in the first competition shall be his distance in this match until finally decided. No penalties for previous winnings on same day. No allowance for bore of gun.

Benjamin.....29 yards	1 1 1 1 1 1 1 0 1 —9
Arthur.....25	1 1 1 1 1 1 0 0—1 1 —10 —9
Dunleavy.....25	1 1 0 1 1 1 0 1 1 —10 —9
Hammond.....25	1 0 1 1 1 1 0 1 1—0 —8
Hallman.....25	1 0 1 1 1 1 0 1 0 —7
Howard.....25	0 0 1 1 1 0 1 0 1 —6
White.....27	1 0 1 0 1 1 0 0 w. —5
Wood.....22	1 0 1 1 0 1 0 0 0 —5
Dunlap.....24	1 0 0 1 0 1 0 0 0 —4
Hoffman.....27	0 0 1 1 0 w. —3
Dexter.....29	0 0 1 0 w. —2

Same Day.—Sweepstakes, miss and go out.

Dunleavy.....27 yards	1 1 1 1 1 1 1 —8
Howard.....29	1 1 1 1 1 1 0 —7
Hoffman.....27	1 1 1 1 1 1 0 —6
Dexter.....26	1 1 1 0 —3
White.....25	1 1 0 —2
Arthur.....27	0 —0
Benjamin.....25	0 —0

L. I. SPORTSMEN'S ASSOCIATION.—A special meeting of Long Island Sportsmen's Association was held at the Royal Arcanum Room, Mosshall, Brooklyn, Friday evening, April 1. The meeting was called to order at 9 o'clock, with President Chappell in the chair. The prize committee reported that they had succeeded beyond their largest expectations, they having tendered the use of the association and requested to proceed with the "good work." Mr. Cook, of the bird committee, reported that he had received several proposals in regard to furnishing birds, but had made no contract, as he wished to get the lowest. The association moved that the following prize committee were then given power to make any contract which seemed proper to them. The committee on game laws reported that they had taken the bill to Albany, and now could only wait for further developments. Mr. Chas. Cook, of the Long Island Fish and Game Club, was duly elected by acclamation Assistant Secretary in place of Theo. Obrig, resigned. It is suggested by several gentlemen that the Long Island Sportsmen's Association send a team for the Dean Richmond trophy of the coming tournaments, and the several clubs are requested to confer among themselves and report at the next meeting of the association. Mr. Chappell said that as he was going to the Hot Springs, Ark., for his health, and would be gone about six weeks, he wished to be relieved from any responsibility while absent, on a motion by Mr. E. Elmendorf, a vote of thanks was tendered Mr. Chappell for the zealous manner in which he had transacted the business pertaining to his office. The good wishes of the association go with him, and it is sincerely hoped that he will return in health and vigor. During the time he is absent the first Vice-President will assume all responsibility. Mr. Chappell then thanked the gentlemen for their good wishes and the meeting soon adjourned.

THE RAYMOND SPORTSMAN'S CLUB.—The regular meet of this organization took place on their grounds at Wellington, Mass., March 18. The day proved a good one for the sport and the attendance fair. The first event upon the programme was shooting from a rotary trap, twenty balls, eighteen yards' rise. The scores were really elegant, Jarvis, Smith and Fox breaking every ball thrown at them, while Witherell and Kirkwood only missed one each. At the second event of the day, a team match, ten balls from a rotary trap, in which good work was done, of the most interesting contest, the winning team being victorious by only one point, as the summary shows. Following are scores in both matches: D Jarvis, 20; J. C. Smith, 20; G. H. Fox, 20; W. B. Witherell, 19; D. Kirkwood, 19; A. E. Robinson, 17; G. H. Leach, 15; J. H. Paine, 15. In the team match, Jarvis, Fox, Paine and Kirkwood composed the winning team; Smith, Witherell, Leach and Robinson the second team. The first team's total was 33; second team's total, 32.

LONG ISLAND SHOOTING CLUB, March 25.—The members enjoyed an exciting day's sport before the traps at Dexter's to-day. The occasion of the meeting was the regular monthly contest for the cup and membership of the club, for which seventeen competitors entered. The birds were quicker and stronger than the average, and a blustering strong northwest wind carried most of them half way to the boundary line before the shooter could fairly get his gun on them. The following are the details; 7 birds each from H and T ground traps, handicapped rise, 80 yards boundary, single barrel; club rules; ties shot off at three birds each:

ALEXANDRIA ROD AND GUN CLUB.—The Alexandria Rod and Gun Club of Louisiana has recently had two glass balls for the club championship badge, which was first won by Judge H. L. Dalgre, with the creditable score of 9 out of 10 balls. At our last match, Feb. 5, the winner was Dr. Watson, only the sum of 5 cents, but the club had as a substitute for the Bogardus trap, which was used in the first match, Card's double rotary, and the way it slung the balls around puzzled the cracks of the club, and those who had made the best scores at the Bogardus trap came out at the tail end of the score with the Card's double rotary. Nothing like a change for amusement.

POWOW SHOOTING CLUB.—Amesbury, Mass., April 2.—At the monthly meeting of the Powow Shooting Club, held Wednesday evening, March 30, the semi-annual election of officers resulted as follows: President, J. G. Grieves; Vice-President and Captain, Walter Hatch; Secretary and Treasurer, F. F. Morrill. At present the club has a membership of thirty-four.

The first monthly contest for a gold medal donated by the citizens of Salisbury and Amesbury, and a valuable prize donated by W. R. Schaeffer, Esq., of Boston, will be held on Fast Day. M.

N. Y. STATE SPORTSMEN'S MEET.—At a meeting of the Long Island Sportsmen's Association, on Friday last, the Committee on Prizes for the State Association tournament, to be held on Coney Island early in June, reported a long list of prizes promised, many guaranteed. They have been presented by the most prominent gunmakers and

business men in sporting circles, and consist of guns, fishing rods and tackle, a gold watch, several suits of clothes, a set of furniture, books on sporting, a handsome bronze trophy, a rifle and other useful articles, together with upward of $2,000 in cash. Many other prizes will be added, during the forthcoming meeting, in the number and value of prizes offered, the most important ever held by the State Association.

TOPEKA, KANSAS.—A three days' tournament will open on the grounds of the Topeka Gun Club on April 26, with $5,000 in cash premiums, with many prizes in kind. The matches are open to all comers. During the tournament Eugene Bogardus and Charles Ramsey, both 21 year old rivals, will shoot a match. There are eighteen purses in all, three of them being for teams.

ALABAMA STATE SHOOT.—The Alabama State Sportsmen's Association' Shooting Tournament will be held at Montgomery, Ala., from May 9 to 14 inclusive. Purses of $4,000 are offered. Particulars may be had of Henry C. Davidson, Sec., Montgomery, Ala.

NEW PARK, R. I., March 26.—The seventh contest for the Ballard rifle presented by W. Milton Farrow to the Newport Rifle Association was shot to day. This shoot ended the contest, as Chas. S. Plummer won this same for the third time. Score 44 out of a possible 50.

In the Carver-Scott match in London the last evening's shoot was at 250 balls each, the supply having become exhausted at that point. The purse was £600.

At the change of life nothing equals Hop Bitters to allay all troubles incident thereto.

Yachting and Canoeing.

LENGTH MEASUREMENT PRACTICALLY ABANDONED.

THE Eastern Y. C. has determined to measure for racing by adding the beam to two-thirds the length. What the reasoning may be by which this particular decision has been arrived at we do not know, but as no rule can well be less logical or more mischievous in its tendency than "simple length," the club may be congratulated upon having got rid of a hampering incubus, and as being at least under salt for something better. Measurement by length may now fairly be considered as abandoned among the clubs whose rules are framed for cabin yachts, and not simply for open boats in which everything may be sacrificed for prize-winning. Much less, hardly anything is being expected from sailing machines outside spuriously-imputed speed on some faulty rule of matching, for which they have been especially modelled to cheat their neighbors, within the law to be sure, but none the less to acquire a reputation for speed not warranted under a rational method of comparison.

Length has now been discarded by the Eastern Y. C., Portland Y. C., Salem Bay Y. C. and Beverly Y. C., leaving in the East only the Dorchester Association adhering to the old order of things. But the Dorchester has for some time had a change in its rule under advisement and we may see it racing even this season under some modification which will be more nearly a measure of size than a single dimension. This virtually leaves only two clubs on the seaboard, the Boston and Atlantic still conspicuously adhering over a question so all-important, and willing, apparently, to put up with an obvious evil because no one cares to start the work of a much-needed reform. However, with the example of others before them, it cannot be long before they, too, come out of the last ditch, when the last vestiges of the stunting, wash-bowl and machine-fostering rule will rapidly disappear from sight, and our yacht clubs will no longer be open to the charge of unmanliness with the multiplication table, or the difference between distance and sail area, of more importance than it can prevail, but out of chaos order will come in the due course of events, and therefore we welcome the proofs of the revolution now seething. Under any circumstances we are on the safe side of the fence, as nothing further than both could be devised, and any result is sure to be the outcome of the present agitation will be better than that. Yachtsmen on the Delaware are not behind in this respect, and we quote with pleasure the letter of a correspondent to *Field and Afloat*, showing that others think as we do anent the imperative necessity of checking the leaning tendency quite as much as the planing tendency on edge of foreign waters, and of rating boats in a rational and equitable way, if racing is to remain a test of model, and not simply a vulgar matter of *outbragging* your competitors by building larger and more powerful without regarding to the others "time" in proportion to excess of size. The letter runs as follows:

"I have been repeatedly asked what manner of boat can be built to beat the Minerva, Norcross, and other beamy boats, and I unhesitatingly answer, a boat of moderate beam, with great displacement, less bilge, more beam, and a few more thousand feet of 'dimity,' and all this leads to abortions, manual labor, athletes to sling sand bags and ballast boxes pulled to windward on railways.

"Let us begin at once and get things down to a respectable standard. I see the Delaware yachtsmen have at last fixed upon a rule that will do away with the long, lank, deep nondescripts, and it is high time we follow their example and figure down to a living breadth of beam, so that the unsightly "pancake" shall be known no more."

TO SUPERSEDE STEAM.

ANOTHER "revolution" is upon us. Steam engines and boilers are to be things of the past, sailing yachts will go out of date, and all we need for motive power is the latent heat of an occasional bucket of water drawn from over the side. Prof. Gamgee, known to the public at large as the inventor of the "Gamgee refrigerating ship" for mitigating the spread of yellow fever, and known to professional men as a chemist and student of research, can now sleep serenely without any misgivings as to where his next meal is to come from. His fame and his fortune are made. There are only a few mechanical details to be settled, he says the engines and boilers go, and the world takes a fresh start, its work to be accomplished without cost other than a slight shave on Dame Nature. A "revolution" surely, and one that leads the mind to wander off afar in daring speculation, of the changes in this world's economy now about to open on us. But time is precious and space is limited, so we will confine ourselves to the yachts of the future—just as soon as the "zero motor" has been shown to be a success. And what a pity our dear old friend at home is not an engineer and mechanic, instead of love to do with gassy stocks. Such fun and such fortunes on the slimmest of margins! Here is what such an excellent authority as Chief Engineer Isherwood, U. S. N., says in his report to the Navy Department:

"From observations made by Profes-or Gamgee in the experimental working of this machine he deduced the possibility or what he terms a zero motor, in which, by means of properly adapted apparatus invented by himself, the heat in water or other objects at ordinary atmospheric temperatures may be utilized to vaporize liquid ammonia under very considerable pressures, but within the control of known means of retention. The high pressure gas thus obtained being used with the greatest practicable measure of expansion on a working piston, generates power, becoming by that very economizing use greatly refrigerated and diminished in bulk, and partially liquefied at the end of the stroke of the piston, when it is exhausted and then returned by a method invented by Professor Gamgee to the ammonia boiler whence it came. The cycle is thus a closed one; no material is lost, and no heat is rejected in matter leaving the engine. The work done by the engine is due to the difference in bulk of the material when it enters and when it leaves the boiler, that difference being caused by the heat derived from water or other natural objects in the ammonia boiler and from the refrigeration resulting from the transmutation of a portion of this heat by the engine into the mechanical work performed by the latter. That this difference of bulk exists is indisputable, and if the proper mechanism can be contrived to utilize it, then the zero motor becomes realized. It will be observed that this power has not been obtained from artificial heat produced by the combustion of fuels, but from the heat of natural objects at ordinary atmospheric temperatures, and therefore costing nothing in money. It is made possible by the fact that liquid ammonia gasifies under considerable pressure at ordinary atmospheric temperatures, the sole difficulty in constructing the zero-motor being to find the means of economically condensing the gas after it has been used as a motive power. Were it not for refrigeration due to the expansive working of the gas, the condensation would have to be obtained by the application, externally to the condenser, of artificially produced cold, and the zero-motor could not be made a commercial success. It is only by obtaining the lower limit of temperature from the action of the engine itself, while the high limit is furnished without money cost by natural objects of atmospheric temperatures, that commercial success becomes possible

"Professor Gamgee has perfected the calculations and drawings for the mechanism required to realize the effects of his invention, and there remains only to execute the mechanical work. He proposes to use the steam cylinder of his ice-making machine as the ammonia cylinder of the new motor, the present ammonia condenser, and the present ammonia boiler as a low pressure boiler, adding another ammonia boiler as a high pressure boiler. These together with the ejector between the condenser and the low pressure boiler, a small pump for pumping liquid ammonia from the low pressure to the high pressure boiler, etc., will constitute the zero-motor—a machine, as will be apparent from this brief description, of the simplest, cheapest and most manageable.

"In the high pressure boiler the liquid ammonia will be gasified by the heat in water of atmospheric temperature to the pressure due to that temperature. In the low pressure boiler ammonia is kept at a considerably less tension than in the high pressure boiler, and with this lower pressure ammonia gas the engine is operated, the gas being used as expansively as practicable and made to do work during its expansion, thereby becoming refrigerated, greatly reduced in bulk and partially liquefied. Immediately on being exhausted the cooled and shrunken gas and whatever liquid of its condensation may be mingled with it are discharged by the ejector from the condenser into the low pressure boiler, the ejector being worked by the higher pressure in the high pressure boiler, as a result the low pressure boiler is continually receiving ammonia and heat from the high pressure boiler. This excess of ammonia in the liquid form is pumped by an ordinary pump from the low pressure back to the high pressure boiler, while the excess of heat is continuously being converted into the mechanical work done by the engine. There is also the extinction of such part of the heat in the high pressure ammonia gas working the ejector as is due to the work done by it in forcing the contents of the condenser into the low pressure boiler. Of course the ejector, the condenser, the low pressure boiler and their connections are protected from receiving heat from the atmosphere and surrounding objects by a non-conducting substance.

"The plan proposed is far from chimerical. It is based on well demonstrated mechanical principles, the whole of which, with the precise, both in theory and mechanical detail, nor can it be shown, *a priori*, that there is not a fair prospect for success. There can be no doubt that the product of the pressure and volume of the contents of the ejector tube, which are to be forced into the low pressure boiler, is less than the product of the pressure and volume of the ammonia gas which leaves that boiler to operate the engine, and that this difference which has not been produced by the external application of artificial cold, but by the working of the machine itself, is available for the production of power for useful purposes. All that remains is to give the system a practical test in order to ascertain whether the mechanism proposed will act efficiently enough to realize the expected result. Should this prove to be the case, the steam engine will, within the near future, be certainly superseded by the zero-motor."

SLOOPS OF THE NEW YORK YACHT CLUB AND THE AMERICA CUP.

Editor Forest and Stream:

From what the papers say it is pretty clear that there is going to be a contest for the celebrated America cup, and unless this much-coveted trophy is to be quietly resigned to the adventurous challenger, it behooves the gentlemen of the New York Yacht Club to bestir themselves and to look about for some suitable representative, at and willing to do battle for them on the momentous occasion.

Dame Rumor says that the challenger is going to be a single-sticker of American model and heavily sparred. Hence it is from among the sloops of the N. Y. Y. C. that a champion will have to be selected. The same may-be-regarded remarks as to details respecting the size of the boat now building in Canada as to enable us to tell by analogy that she will be rather larger than any sloop in the N. Y. Y. C. except the famous Gracie.

There seems to be a feeling in favor of naming a boat to represent the club somewhere about the same size as the challenger, and this restricts the number of available boats very much. It is much to be regretted that this should be the case as the strength of the N. Y. Y. C. is in the sloops of the 30 ft. class and 25 sloops, with the present exaggerated time allowance of the club that possible chance, I should like to know, would the coming stranger have if pitted against such craft as the Wizard, or such a flyer as Mr. Willard's new boat is likely to prove, or even the Regina or the well-known Vixen? I confess to being utterly unable to calculate the complicated time allowances of the N. Y. Y. C., but I got a friend who is a member of the club to figure it out for me, and he assures me that the stranger would have to allow those little beauties from 10 to 12 minutes over the club course. The boat that can do this is probably not yet designed.

There are but four boats in the club approaching the Canadian in size—Gracie, Hildegarde, Mischief and Vision. For some reason the Arrow does not appear in the list, or perhaps it would not take kindly for the members of the club to decide on their representative. Having once been the owner of a little sloop, I have watched with much interest the careers of boats of that rig, and I say unhesitatingly that any one of the four named, if not all of them, would have, as a rule, if he can free his mind from prejudice, agree with me that in placing these boats alphabetically I have also placed them in the order of their merits. I am aware that I here approach a delicate point. Do I not single out for honor Ann Sprague, and do I not know the way the over-sparred and over-estimated Mischief has been held up by you during the past season as a model of everything that is good, virtuous and beautiful? This is, I know, a tender spot with you, but is it not better that it should be touched lightly with a friendly hand than that the falling be left to others, who, in that case should, six months hence, become painfully aware that owing to an amiable weakness for a friend you have so pulled the wool over the eyes of the yachting fraternity as to induce them to name as their representative one not internationally worthy to be put on that, and that you have thus been the means of losing to this country a trophy held by them at all hazards against all comers for 30 years!

But to return to the way I have classified the boats: "It will, I think, appear to me that the day of the 30 ft. sloops is over, and that despite the beautiful condition in which she is known to be, and the admirable way in which she is handled, she can no longer hold her own against more recent productions. But you will say, what of Hildegarde? What can she do? This is the boat, my friend, which I have seen under her old name of Annie Lowndes beat the fleet of Atlantic Yacht Club clippers—aye, and do it easily, blow high, blow low. She always was a tough customer, and, sailed as she will be this season by her enterprising owner, a great deal more will be got out of her than was ever imperial observation. But I will not risk much in predicting that she will make her numbers ahead of the much-vaunted iron sloop in all weathers during the coming season. A young yachtsman! I think I hear you say of her captain. None the less, however, has he been unanimously chosen captain of the N. Y. Y. C., an institution which knows a thing or two about yachts, yacht sailors *et id genus omne*, or thinks it does.

We now come to the respective merits of the two remaining boats, the Gracie and the Mischief. The Gracie is well known for years as a steadily successful craft, seldom if ever beaten—never, I may say, without some good excuse—always ready when called on, never making a great parade of her doings, but invariably at the end of a season standing higher in the estimation of yacht-racing circles than she did at the beginning. Of the other boat I know little, but she shows a fair record for a new boat, and I admit that an unobservant man would call her a success, but when it comes to an international contest we must go behind the record and get at the bottom facts before we select a representative. How often does it happen did these boats meet? Four times. With what result? The unobservant man would say the Mischief won three races out of four, and would have won the fourth had it been sailed with the customary allowance of sail carried in her size. And I am not prepared to risk much in predicting that she will make her numbers ahead of the much-vaunted iron sloop in all weathers during the coming season. A young yachtsman! I think I hear you say of her captain. None the less, however, has he been unanimously chosen captain of the N. Y. Y. C., an institution which knows a thing or two about yachts, yacht sailors *et id genus omne*, or thinks it does.

discount in the East. Experience has at last brought builders to the same conclusions we have been advocating for years. An endless amount of small tonnage is being put together in Boston and neighborhood, where they are building half a dozen yachts to every one on the stocks in New York. We cannot explain this upon any other ground than that a taste for the sea comes more natural to our Eastern population.

WEITHER ARE WE DRIFTING?—Are our Boston exchanges right this time? Lawlor is reported as having finished a cat-boat for a well-known yachtsman of more than remarkable dimensions. She is 25 ft. over all, 22 ft. water line, will draw 5½ ft., and has 1,900 lbs. on her keel. Evidently Eastern yachtsmen do not split hairs about draft, and they have acres of mud flats right in Boston harbor, too. The spars for this boat are: mast, 33 ft.; boom, 29 ft., and gaff 17 ft. 6 in. Nearer home, "Phi" Ellsworth has got to work on a tidy ship which promises to be a peer on length measurement, though when gauged by size, as a logical rule should do, our faith would not be very great in her or any of her type. She is 30 ft. over all, about 22 ft. on load line, has 13 ft. beam and 5 ft. depth. From these figures our esteemed contemporary, the *Boston Herald*, will see that we were not so very far wrong recently in predicting washbowls with as much beam as length before long, if we persist in adhering to measurement by length. Fortunately this rule seems to have had its day, but it will be some time before the damage done and the false standards set up can be banished from the badly warped commonplaces now so generally accepted as sound principles of modelling.

VINDEX.—This iron cutter has been bought by Mr. Arthur Slade, of Boston, and thus New York loses another honest boat and nothing to take her place. The Vindex may not be all that is claimed for her, but she will always be remembered as the first of a class now becoming so popular. Experience may have dictated modifications of the original, but the Vindex was the first of the family of the "medium type," an attempt, and a fairly successful one, too, to blend the best qualities of sloop and cutter. To Com. Robert Center and Mr. A. Cary Smith the credit of her design belongs, we believe, and that is something worth noting, for when the iron was rolled for Vindex's garboards she was the first yacht to be built of that material in America, and in many respects a bold innovation upon existing practice. She was built in 1870 at the yard of Reany & Archbold, Chester, Pa., and is 63 ft. over all, 56 ft. on water line, 17 ft. beam, 8 ft. deep, and draws 8 ft. 10 in. Her ballast, besides a 36x1 in. keel and 1 in. garboards, consists of 15 tons of lead. As a racer she proved fairly successful, and as a cruiser she has boxed about our coast in all sorts of weather more than any yacht of her size.

THE SEASON IN BOSTON WATERS.—The South Boston *Inquirer* says: "The close advent of the yachting season is foreshadowed by the increasing interest which is manifested by yachtsmen in the welfare of their favorite craft, and the orders which are being freely given for alterations, improvements and general overhauling. Our principal boatbuilders are overcrowded with work, and the indications are favorable for a more general and widespread interest in boats than has ever occurred before. Lawley & Son are employing twenty-five men, more than they ever employed before, and report having to decline work offered them to a greater extent than that they now have in hand."

BUILDING AT EAST GLOUCESTER.—J. E. Margeson & Co. are building for Capt. G. L. Marsh a sloop yacht (keel, of course), 28 ft. long, 9 ft. beam, planked with cypress. Geo. and Andrew Wheeler are at work on a handsome sloop, 22 ft. long and 8 ft. beam. At Annisquam Point the Friend Bros. and H. P. Elwell are having a craft built by Davis, 26½ ft. long and 9 ft. beam. She is to have a centre-board, and for that reason is quite a remarkable boat in the latitude where the board has been discarded. Cat boats and small fry generally are building by the score.

EARLY CRUISING.—Sloop Virginia, Mr. Wood, has been cruising down the Delaware and reports ducks plenty, but a little wild. The fleet of the Quaker City Y. C. is receiving a spring overhaul and many of their ships will be at their moorings early this season, as considerable activity is promised among yachtsmen on the Delaware. The club will likely build headquarters in the immediate vicinity of Philadelphia.

FOR SALE AND WANTED.—In another column will be found offered for sale the well-known compromise cutter Comfort. She is built in the best manner and under special inspection, and is one of the most desirable craft of her tonnage in America. Eastern dealers are referred to another advertisement for a small keel yacht, sloop or yawl rigged.

NEW YORK YACHT CLUB will after all sail its annual races, the 16th of June having been selected. Cups are offered for keel schooners and sloops, and Rear Com. Oelrichs has donated a cup, value $500, to be sailed for during the annual cruise. The new committee on the American cup consists of Messrs. Krebs, Center and Tams.

THE EASTERN BOOM.—Says the *Boston Herald*: "The yachting 'boom' has reached City Point. Every workshop has all it can do, and orders are pouring in from all quarters, indicating that the season of 1881 will be the liveliest ever seen at the famous yachting resorts."

VISION.—Mr. Tenney's fine little sloop of Boston is having her post carried aft, and, to be up with the day, has added 800 lbs. to the 700 on her keel, making 1,500 in all on the keel of a boat only 22 ft. water line. Woods Bros., of Jeffries Point, have the work in hand.

NEW CUTTER.—Mr. A. Cary Smith has finished the design for a cutter of the medium type for New Haven owners. She is about 50 ft. long.

SEAWANHAKA YACHT CLUB.—Work is in progress on the new club house, Staten Island. Opening cruise, May 30.

MADGE.—Mr. P. G. Sanford, of Westport, Conn., has sold his 30 ft. sloop Madge to Mr. J. J. Phelps, of New Haven.

YOSEMITE.—Mr. Belden's big steamer has gone on a cruise to Bermuda.

Answers to Correspondents.

☞ No Notice taken of Anonymous Communications.

G. L. S., Halifax.—See adv. of Dudley, Poughkeepsie, N. Y., in this number.

F. B. G., Boston, Mass.—The address you ask for is 153 Dearborn av., Chicago, Illinois.

J. M. S., West Middlesex, Pa.—Will you change my paper to another post office, as I intend to go West some time in April? Ans. Yes.

A number of correspondents will understand why their questions are not answered by referring to the notice at the head of this column.

H. C. T., Deep River, Conn.—Eighty-two and a half pounds is an unusually large weight for your setter dog; it indicates that he has not had sufficient exercise during the past winter. You had better work him down this spring.

G. B., Princeton.—Will you be kind enough to give me your opinion of the ———— guns, and if they are preferred by hunters and others? Ans. We have heard them well spoken of, but have no personal knowledge of the arm.

J. U. G., Quebec.—Will you please inform me whether wild rice will grow in brackish water—about half salt water? Ans. Probably not. It will grow in water that is somewhat brackish, however, but the proportion of salt must be slight.

J. H. W., Coal Valley.—Could you give me any information as to the island of Newfoundland, whether there is anything published in regard to the fur-bearing animals of that country? Ans. We know of no special work that will give you the desired information. Hallock's Gazetteer contains more or less about Newfoundland and its fauna. We can send it; price $3.00.

R. S. M., New York City.—The pedigree of Hamilton Thompson's Irish setter Duke is as follows: Duke, whelped 1872 out of Thompson's Belle by Bang. Bang out of Belle by Paul Mead's Dash. Belle out of Palmer's Belle by Paul Mead's Dash. Thompson's Belle out of Jane by Robinson's Jack, he out of Gubner's Liska by Putnam's Dan. Jane out of Fanny by Rodman's Dash.

—Any subscriber or reader of FOREST AND STREAM in want of any kind of carpetings, oil cloths, rugs, etc., etc., can be sure of fair treatment at the hands of John H. Pray, Sons & Co., Boston. Call or correspond with them, and get their prices before buying. It will pay you to try them.—[*Adv.*

PUBLISHERS' DEPARTMENT.

TROUT FISHERMAN.

Can learn of a rare opportunity for purchasing a small farm in a charmingly healthy and respectable locality within an hour of New York city, by rail, on which are several powerful, overflowing and never-failing or diminishing springs of delightful clear, cool water suitable for making a large pond, at very small expense, for propagating and angling of trout and other fish of like nature, by addressing "Angler," Box 23, Newark, N. J., Post Office. Excellent orchard, grazing and fine farm house on premises.

An excellent opportunity to buy a good Trout Rod cheap is offered in one of our "For Sale" advs. this week

H. C. Leonard, the veteran manufacturer of split bamboo rods, has removed his works from Bangor, Maine, to Central Valley, N. Y., and William Mills & Son, of this city, are still his sole agents.

We would call attention to the "Improved Dudley Pocket Cartridge Loader" advertised in this week's F. and S.

Holabird Shooting Suits. Upthegrove & McLellan, Valparaiso, Ind.

STONEHENGE ON THE DOG.

Price $3 50.

For sale by Forest and Stream Publishing Co.

The Kennel.

FOR SALE.—THE BLUE STAR COCKER SPANIEL BREEDING KENNEL.—I will sell reasonably, owing to poor health and increase of private business cares, which will call for all the spare time I care to give in the future, and also enable me to complete my unfinished work on breeding, breaking and management of Spaniels for American Sportsmen. Therefore I offer as above my Kennel stock, all accessories, together with Kennel name and good-will, to any one having the taste and competent to carry on the good work well. The demand for this breed is immense. Over five hundred pups would have been sold last year (1880) from this Kennel had we had them. My price, $1000, is extremely low, considering its well established reputation and lucrative facilities. I will give all time and advice required, gratis, to the successor. One having breeding experience is preferred, and would like to hand over before June next. Only parties meaning business need apply. M. P. McKOON, Proprietor, The Blue Star Kennel, Franklin, Del. Co., N. Y. Mar10,tf

FOR SALE—Red Irish Setter Dog, Imp. Grinsa, by Moore's Rufus ex Twigg's Kate, 2nd prize, Dublin, 1877: Rufus, by Palmerston ex The Queen; Kate, by Patsy, (a Palmerston) ex Moore's Flora, dam of Mina, and several other champion and prize bitches. Grinsa won 2nd open class and V.H.C. champion class, Baltimore, 1878, when but 12 mos. old. Only time ever shown.

Red Irish Setter Bitch Rosina by Imp. Grinsa ex Imp. Bella; Bella, by Dr. Boyd's Patsy ex C. Moore's Bell: Bell, by C. Moore's Old Shot (father of Palmerston) ex Old Kate. Both the above dogs were thoroughly broken by Mr. Gladson, now with Mr. Orgill. Also the Chesapeake Bay dog Greek, by Mr. Jno. Stewart's Turk ex Mr. Martinet's bitch. Address GEORGE BROWN, No 4 Exchange Place, Baltimore, Md. mar17,4t

ST. BERNARDS FOR SALE.—The undersigned, wishing to reduce his kennel, offers for sale several magnificent imported Mount St. Bernard dogs and bitches, carefully selected from the best European strains. To be sold for no fault. For prices, pedigrees, etc., address. LE ROY Z. COLLINS, Sept 18-tf Lancaster, Mass., U. S. A.

NEMASKETT KENNEL, Richmond & Vaughn Proprietors, Middleboro, Mass. Sporting dogs boarded, broken and handled by men of experience. Setters, Pointers, Fox Hounds and Beagles trained for their respective work. Satisfaction guaranteed. Also, a number of well-trained Setters and Pointers for sale. Address BOX 335, Middleboro, Mass. H. B. RICHMOND, N. H. VAUGHAN. Feb17,3mo

Hotels and Routes for Sportsmen

"THE FISHING LINE."

TAKE THE

Grand Rapids & Indiana R.R.

Mackinaw, Grand Rapids and Cincinnati Short Line

FOR THE

Trout, Grayling, and Black Bass Fisheries, AND THE

FAMOUS SUMMER RESORTS AND LAKES OF

NORTHERN MICHIGAN.

The waters of the

Grand Traverse Region

and the Michigan North Woods are unsurpassed, if equaled, in the abundance and great variety of fish contained.

BROOK TROUT abound in the streams, and the famous AMERICAN GRAYLING is found only in those waters.

The TROUT season begins May 1 and ends Sept. 1.

The GRAYLING Season opens June 1 and ends Nov. 1.

BLACK BASS, PIKE, PICKEREL and MUSCALONGE, also abound in large numbers in the many lakes and lakelets of this territory.

The sportsman can readily send trophies of his skill to his friends or "club" at home, ice for packing fish can be had at many points.

TAKE YOUR FAMILY WITH YOU. The scenery of the North Woods and Lakes is very beautiful; the air is pure, dry and bracing. The climate is peculiarly beneficial to those suffering with

Hay Fever and Asthma Affections.

The hotel accommodations are good, far surpassing the average in countries new enough to afford the finest of fishing.

During the season Round Trip Excursion Tickets will be sold at low rates, and attractive train facilities offered to Tourists and Sportsmen.

Dogs, Guns and Fishing Tackle Carried Free at owner's risk.

It is our aim to make sportsmen feel "at home" at this route. For Tourist's Guide (an attractive illustrated book of 80 pages), containing full information and accurate maps of the Fishing Grounds and Time Cards, address A. B. LEET, Gen. Pass. Agent, Grand Rapids, Mich.

Bromfield House, Boston.

EUROPEAN PL.

MESSENGER, Proprietor.

Wild Fowl Shooting.

SPRINGVILLE HOUSE OR SPORTSMEN'S RETREAT, SHINNECOCK BAY, L. I.

BY A PRACTICAL GUNNER AND AN OLD Bayman. Has always on hand the best of boats, batteries, etc., with the largest rig of trained wild-geese decoys on the coast. The best ground in the vicinity of New York for bay snipe shooting of all varieties. Special attention given by himself to his guests, and satisfaction guaranteed. Address Wm. N. LANE, Good Ground, L.I. Refers by permission to J. B. Shepherd, 391 Broadway and Wm. Dutcher, 320 Broadway, N. Y.

Virginia Midland R. R.

The Safest, the Shortest, the Best Route to Florida and South.

Pullman Palace cars direct without change. Guns and dogs carried free. Leaves New York at 10 P. M. and 3:40 P. M.; Washington, 7:10 A. M. and 10 P. M. MERCER SLAUGHTER, General Ticket Agent, Alexandria, Va.

Hotels and Routes for Sportsmen.

TO SPORTSMEN.

The Pennsylvania R. R. Co.,

Respectfully invite attention to the

SUPERIOR FACILITIES

afforded by their lines for reaching most of the TROUTING PARKS and RACE COURSES in the Middle States. These lines being CONTINUOUS FROM ALL IMPORTANT POINTS, avoid the difficulties and dangers of reshipment, while the excellent cars which run over the smooth steel tracks enable STOCK TO BE TRANSPORTED without failure or injury.

THE LINES OF

Pennsylvania Railroad Company

also reach the best localities for

GUNNING AND FISHING

in Pennsylvania and New Jersey. EXCURSION TICKETS are sold at the offices of the Company in all the principle cities to KANE, RENOVA, BEDFORD, CRESSON, RALSTON, MINNEQUA, and other well-known centers for

Trout Fishing, Wing Shooting, and Still Hunting.

Also,

TUCKERTON, BEACH HAVEN, CAPE MAY, SQUAN, and points on the NEW JERSEY COAST renowned for SALT WATER SPORT AFTER FIN AND FEATHER.

L. P. FARMER, Gen'l Pass. Agent.

FRANK THOMSON, Gen'l Manager. feb17-13

Chesapeake & Ohio R.

The Route of the Sportsman and Angler to the Best Hunting and Fishing Grounds of Virginia and West Virginia,

Comprising those of Central and Piedmont Virginia Blue Ridge Mountains, Valley of Virginia, Alleghany Mountains, Greenbrier and New Rivers, and Kanawha Valley, and including in their varieties of game and fish, deer, bear, wild turkeys, wild duck, grouse, quail, snipe, woodcock, mountain trout, bass, pike, pickerel, etc.

Guns, fishing tackle, and one dog for each sportsman carried free.

The Route of the Tourist,

through the most beautiful and picturesque scenery of the Virginia Mountains to their most famous watering places and summer resorts,

The Only Route via White Sulphur Springs.

Railroad connections at Cincinnati, with the West, Northwest and Southwest; at Gordonsville with the North and Northeast; and at Richmond and Charlottesville with the South. All modern improvements in equipment.

CONWAY R. HOWARD,

Hornbeam Rods

A SPECIALTY.

W. HUNTINGTON,

WILTON, CONN.

Makes a specialty of the manufacture of FINE HAND-MADE RODS of Hornbeam for fly-fishing. Every fly-fisher should have one of these rods, for whatever preference he may have these are the only thoroughly reliable rods, secure against breakage and capable of real hard usage. With one of these rods a sportsman may venture into the woods for a season and take no other rod, and be fairly sure of returning with it in serviceable condition. As made from wood of my own cutting and seasoning, they are powerful, easy in action and full of endurance. For circular send to WALLACE HUNTINGTON, as above.

GUNPOWDER!

Dupont's Rifle, Sporting and Blasting Powder.

THE MOST POPULAR POWDER IN USE!

DUPONT'S GUNPOWDER MILLS, established in 1802, have maintained their great reputation for seventy-eight years. Manufacture the following celebrated brands of powder:

Dupont's Diamond Grain.—Nos. 1 (coarse) to 4 (fine) unequalled in strength, quickness and cleanliness; adapted for glass ball and pigeon shooting. Packed in 1lb canisters.

Dupont's Eagle Ducking.—Nos. 1 (coarse) to 3 (fine); burns slowly, strong and very clean; great penetration, with a close pattern; adapted for glass ball, pigeon, duck and other shooting, with either muzzle or breech-loaders. Packed in 1lb and 5lb canisters and 6¼ and 12½lb kegs.

Dupont's Choke Bore.—Specially adapted for "Choke Bore" Guns, and particularly for prairie and upland shooting. Burns slowly, strong and moist; does not cake or burn on the barrels, gives both a good penetration and a close pattern. Will be found well adapted for glass ball and pigeon shooting. Made of two sizes, only No. 7 and No. 6. No. 7 being the coarsest. Packed in 6¼lb kegs and 1lb canisters.

Dupont's Eagle Rifle.—A quick, strong and clean powder, of very fine grain for pistol shooting. Packed in 1lb canisters and 6¼ lb kegs.

Dupont's Rifle Fg. "Sea Shooting."—FFg. and FFFg. The Fg. for long-range rifle shooting, the FFg. and FFFg. for general use, burning strong and moist. Packed in ¼lb, 1lb and 5lb canisters, 6¼, 12½ and 25lb kegs. Fg coarse, FFFg. fine.

Dupont's Sporting, Mining, SPECIFICO and Blasting Powders of all sizes and descriptions. **Special Grades for Export.** Also Rifle, Cartridge, Musket, Cannon, Mortar, Mammoth, Hexagonal, Cubical and Pellet Powder, U. S. Government Standard. Powder manufactured to order of any required grain or proof.

Agencies in all the cities—and principal towns throughout the United States. Represented by **F. L. KNEELAND, 70 Wall Street, N. Y.**

N. B.—Use none but DUPONT'S Fg. or FFg. for long-range rifle shooting.

The Hazard Powder Co.,

MANUFACTURERS OF

GUNPOWDER.

Hazard's "Electric Powder."

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of one pound *only*.

Hazard's "American Sporting."

Nos. 1 (fine) to 6 (coarse). In 1 lb. canisters and 12½ lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to shot guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6¼ and 12½ lb. kegs. Burns *slowly* and very clean, shooting remarkably close and with *great penetration*. For field, forest, or water shooting, it ranks any other brand, and it is equally serviceable for muzzle or breech-loaders.

Hazard's "Kentucky Rifle."

FFFG, and "Sea Shooting" FG in kegs of 6¼, 12½, and 6¼ lbs. and cans of 5 lbs. FFFG is also packed in 1 and ½ lb. canisters. Burns strong and moist. The FFFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard *Rifle* Powder of the country.

Superior Mining And Blasting Powder.

GOVERNMENT CANNON and MUSKET POWDER; also, SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF, MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's Agents, in every prominent city, or wholesale at our office.

ANSWERS TO CORRESPONDENTS 217

TO CORRESPONDENTS.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen.

Communications upon the subjects to which its pages are devoted are invited from every part of the country.

Anonymous communications will not be regarded. No correspondent's name will be published except with his consent.

The Editors cannot be held responsible for the views of correspondents.

All communications of whatever nature should be addressed to the Forest and Stream Publishing Company, Nos. 39 and 40 Park Row, New York.

FOREST AND STREAM.

Thursday, April 14.

AVIAN RIDERS.

DR. MERRILL'S interesting account of the belief of the Crow Indians that a small bird, probably a grebe, performs its migration on the back of the sand hill crane, was no doubt new to our readers. It appears, however, that a similar belief is widely spread among various tribes of North American Indians. Dr. Merrill's account referred to the Crows, but he mentioned also that the Crees entertained the same belief in reference to the white, or whooping, crane. Recently in the London *Nature*, Mr. John Rae gives an account of the supposed passage of certain small birds on the backs of the Canada geese as related by the Northern Indians which he apparently believes in. It is generally asserted by the Maskegon Cree Indians who dwell about the southwestern part of the Hudsons Bay, that a small bird, one of the *Fringillidæ*, performs its northward migration in spring on the back of the Canada goose (*Bernicla canadensis*).

This species reaches Hudson's Bay about the last of April, and the Indians state that often when the geese are fired at the little birds are seen to fly away from them. The Indians of this region devote considerable time each spring—a month or more—wholly to goose shooting, and their method of doing this is to set out decoys near a blind and to call down the geese which are passing over. It is said that the small birds are only found to accompany those flocks which are called down from a considerable height, the low flying flocks never appearing to have the small birds with them. It is inferred from this that such geese having rested on the ground or having passed near it have been deserted by their little passengers. Mr. Rae says of this belief of the Indians:

"An intelligent, truthful and educated Indian named George Rivers, who was very frequently my shooting companion for some years, assured me that he had witnessed this, and I believe I once saw it occur."

It is said that these little birds only make use of the Canada goose as their conveyance, and it is certain that both arrive at the same time—about a week earlier than the white fronted and snow geese (*Anser albifrons gambelli* and *A. hyperboreus*). A similar story is told by the Indians on the shores of the Athabasca and Great Slave lakes, both of which are great resorts of wild geese, and if the story is purely a fabrication it is difficult to see why it should be told only about the Canada geese and not about any other species.

Unfortunately the bird which is said to employ this labor-saving method of performing its migrations has not been identified, although the writer, an abstract of whose views we have given, stated that he knew it well, and had preserved specimens of it, but it is so long ago that he has forgotten the name.

We trust that further information on this most interesting point will be forthcoming before long.

CARE OF QUAIL IN CONFINEMENT.

PERHAPS there have never been at any time in the history of American shooting so many live quail in confinement as there are at the present time. This fact is the result, on the one hand, of the growth of a healthy sentiment in favor of game protection throughout the length and breadth of the land, and on the other, to the severe weather of the past winter which has led the sportsmen generally to believe that quail have suffered severely throughout the East and South, and in many sections have been so nearly exterminated that without a restocking of the covers little or no shooting can be looked for for several years. It is exceedingly satisfactory to see the interest in this matter so general and widespread, and it may be regarded as one of the signs of the times most encouraging to those interested in the protection and propagation of our game and fish.

Those earnest workers who have for years been laboring for the cause against almost constant discouragement and defeat may now take heart of grace and renew their efforts with fresh vigor. The people are really becoming interested and are taking hold of the matter on all sides. And if the sportsmen as a body and individually shall lead the movement it will unquestionably be a success.

The example of the Springfield sportsmen, already alluded to in FOREST AND STREAM, will, we trust, find many imitators. An enterprise of this kind, when it is once started and has gathered a little way, acquires constantly more momentum. It is cumulative. In winter we have all seen the children when the damp snow lies thick upon the ground make a little ball at the top of a hill and after it has attained respectable proportions roll it to the brow, and start it on its way to the bottom. At first it moves slowly, and sometimes stops two or three times before finally moving off, but when it does at last get started it increases constantly in size and power until at last it is a force that nothing living could withstand. So we trust to see it with game protection in this country, and we believe that the day is not very distant when almost every one will be deeply interested in this most important subject.

FROG CULTURE.—We have had some inquiries regarding frog culture of late. The subject attracted some attention some years ago, when the success of the culture of certain fishes caused people to look at certain other animals which are of value to see what could be done with them. Frogs and mink were among these, and Mr. Henry Ressigue started a minkery in Central New York and raised a few, but his profits came in from supplying other beginners with live stock at $25 per pair, and not from the regular sales of skins at three to seven dollars each, the average prices in those days. The fact that mink fur went out of fashion as sealskin came in put an end to all trials in this line, and it is a question whether a mink will eat what his skin is worth or not; or if not, whether there is anything left after feeding the parents all the year and building stockades for them.

Frog culture never got as far as this. The few experimenters found that birds, by day and night, ate the tadpoles, fish and larger frogs ate them, and that there was no way of feeding frogs, which was satisfactory and profitable. Large frogs will eat small ones, and unless each individual had a wire covering to protect him and an attendant to feed him, he either ate up his smaller kindred or was engulfed in the capacious maw of his grandfather. From time to time marvelous stories appear in the rural press of some enthusiastic lover of the tailless batracian who has accomplished wonders in rearing frogs. Tadpoles rejoice at his coming, the pipers cry "knee deep" and the bassos greet him with a "bollunk" from the lowest register as he approaches. We have investigated these frog farms, at the cost of much postage, and have invariably found that they were located in the brain-pan of the "funny man" of some rural journal.

The stories might be varied and an increased interest taken in them if the alleged funny man would add that the froggery was under the superintendence of a patriotic frog who nursed the sick tadpoles and administered justice to young scapegraces who took surreptitious rides on the backs of their aged grandparents; also, that he selected mates for maiden frogs in the spring and skinned the hind legs of all confirmed bachelors for market. But, alas! the idea of singing a change does not occur to him, and so the old paragraphs do duty occasionally.

Frogs for the New York market now mainly come from Canada. The neighboring States have been skinned; and as frogs seem to be of slow growth—perhaps three or four years—they do not get a chance to multiply in great numbers. We do not advise large investments in frog culture.

GOING A-FISHING.

EVERYTHING betokened an early start and very young was the day when we started, for punctual as the old-fashioned clock over the fire-place we are off, buoyant with anticipations of pleasure and delight.

We had talked over the trip during the winter weeks, when Jack Frost held possession of the trout streams, and this commenced to look like the realization of a—you might call it an Utopian dream, and more, for the wildest and most extravagant fancy could not picture half the charms of the reality. This is true of angling. It is a solid pleasure to put the rod and reel in order, to inspect line and leader, to take an inventory of the fly-book, to build airy castles, but this is not being among the green hills, nor on the rippling streams, nor in the woods, where sunlight and shadow play at hide and seek. Hoping and wishing is not feeling the electric thrill that tingles through one when some lord of the pool makes his rush for the allurement you have placed before him; but we are getting there fast as our Bucephalus and Rozinante can drag us.

Snap! crack! goes the whip, and the graceful horses, moving easily along, whirl us across the hump-backed bridge to the music of their hoofs, and we are well under way. Not the least important ingredient of going a-fishing is the day's ride when it leads through a pleasant country, and more especially so if one has with him two or three anglers after his own heart; and the experienced angler can rarely be imposed upon in the choice of his companions. It is a very essential part of his piscatorial education to measure men as they are in camp, for he knows that is the place of all places where a man shows more decidedly than anywhere else the good or the bad that is in him. Attempt at disguising his qualities and disposition will not succeed. He will show his colors unconsciously perhaps, but show them he will.

Away we go nodding good-morning to every one we meet, except the pretty girls, speeding along the old road that winds

> "..... Where old roads will
> Here to a ferry and there to a mill;"

past meadows glowing with tender and dainty green; past orchards where the "wind that shakes the barley" has strewn the ground rosy white with the apple blossoms; past daisy-decked meadows by the brook that goes laughing and brawling over the stones, dreaming in the shade and playing in the sunlight Cloud shadows glide over forest and clearing, and everything is one picture of delightful, blushing spring, the time to go a-fishing.

The nooning at the wayside tavern, where we bait our nags and gossip with the landlord, while his good wife, flitting about like a swallow on the wing, is superintending the

preparations for dinner, is quite a noteworthy event of the day. It is a substantial brace, and lets the high liver down by easy stages to the plainer and healthier diet of his lodge in the wilderness.

On again, the horses, brisker than ever after their hour's halt, until at early evening we reach our resting-place for the night, as pleasant a lodging as ever described by Izaak Walton. If a mechanic or master builder would not admire its proportions it would certainly meet with the approval of an artist. Everything about the exterior of the building presented an air of dilapidation and extreme old age. The moss grew thick among the shingles that covered it. The old-fashioned chimney, with its smoke blackened top, had a dangerous slope from the perpendicular. The old logs had commenced to settle, and gave the entire structure a disjointed and irregular appearance. Within doors, however, everything is perfect, from the great fire-place, with its immense capacity for consuming back logs, to its well polished floor and grotesque corners and closets.

We are expected and welcomed with the frank hospitality of a backwoodsman, who knows his friends and displays none of the magnificent indifference that strangers sometimes encounter from men of his calling.

A chatty evening follows, during which we pack our camp kit, for here we leave our horses and swell clothes, and early in the morning, with our guides leading "for'ard to the nor'ard," we foot it away into the woods beyond the last settlement and clearing, beyond the sound and sight of everything that reminds one of business and enterprise to where the primitive sanctity of nature still remains, where she works her fairest marvels and, untrammelled and uncultivated asserts her sovereignty.

Off the beaten track to some choice spot known only to a few hardy trampers, where quiet is the deity that presides over its solemn fastnesses, is the place where we unsling our loads, rig our tackle and in earnest go a-fishing.

MILLARD.

NEW HAMPSHIRE FISH AND GAME LEAGUE.—The annual meeting of the League was held at Manchester, April 5, the President, Jno B. Clark, in the chair. The Fish Comissioners reported favorably as to the progress of the work, which now includes also the care of the game. The League itself is giving its attention principally to the restocking of the Merrimack with shad and salmon. Addresses were made by Rev. Henry Powers on "The Future of New Hampshire;" Mr. Geo. P. Whitman, on the "North American Grouse," and by Col. Waterman Coleman on the introduction of the migratory quail. The following officers were elected for the ensuing year: President, John B. Clarke; Secretary, Charles L. Richardson; Vice-Presidents, Marcellus Eldridge, of Portsmouth; Luther Hayes, of South Milton; E. B. Hodge, of Plymouth; W. W. Fletcher, of Concord; Edward Spaulding, of Nashua; W. S. Shurtliffe, of Colebrook; John Clement, of Troy; W. M. Weed, of Sandwich; M. A. Haynes, of Lake Village; George P. Whitman, of Manchester.

The New Hampshire League is composed of the solid, substantial portion of the commonwealth, and its meetings are always characterized by a spirit of earnest and intelligent discussion of game and fish protection viewed from its highest economic standpoint. We shall refer later to some of the points of Mr. Power's address.

THE RIGHT WORD.—An esteemed Montreal correspondent, Mr. R. H. Kilby, writes: "I sometimes regret the term "sportsman" is so often made use of in connection with fish and game protection, the word has a tendecny to cause the non sporting classes to feel that the effort to protect fish and game arises only from a desire to preserve that which contributes to the sportsman's amusement. Let us endeavor to impress on the minds of those who love neither Rod nor Gun what a bountiful harvest of food our Forests and Streams will yield if short-sighted avarice and greed can be so far restrained as to permit nature to work out her wonderful laws of reproduction."

While endorsing fully the economic view taken by our correspondent we cannot share his regret that the term "sportsman" is so frequently employed in this way. The non-sporting public will find out in due time what an important work has been accomplished by the "sportsmen" of the country, and as the value and importance of the "sportsmen's" fish and game protective efforts are appreciated, it will be fitting that the "sportsmen" should receive the credit. The connection between "sportsmen" and game protection is also doing much to eradicate some of the popular misconception which still clings to the title.

AMERICA HAS SENT TO AUSTRALIA her salmon and her pinnated grouse, and in the first instance at least the gift has proved a valuable one to the recipient. We learn that the favor is now being returned, and that on the Pacific coast the experiment of importing game birds from Australia is being tried. A Mr. Coates, of San Francisco, has recently imported several pairs of Australian pheasants, and has distributed them among a number of gentlemen interested in the acclimatization of game.

An interesting experiment has been tried by one gentleman, Lieutenant Richman, of Mare Island, who is said to have successfully crossed those presented to him with his game fowls, and now has a number of the half breeds alive and well.

It is proposed if the Australian pheasants can be successfully propagated in California to turn a number of them out to shift for themselves in the hope that a new bird may be added to the game fauna of that State.

THE MASSACHUSETTS FISH AND GAME PROTECTIVE ASSOCIATION has elected the following officers for the ensuing year, a selection which gives ample assurance of the continued good work which has given the Massachusetts Association so high a standing: President, John Fottler, Jr.; Vice-Presidents, Hon Thomas Talbot, Hon. Daniel Needham, Walter M. Brackett, Esq; Col. Henry Smith, Theodore Lyman, Esq., Edward P. Brown, Esq, H. T. Rockwell, Esq.; Treasurer, James R. Reed; Recording and Corresponding Secretary, E. S. Tobey, Jr.; Librarian, E. M. Messinger; Executive Committee, Ivers W. Adams, W. S. Hills, Arthur K. Roberts, F. R. Shattuck, C. T. Jenkins; Committee on Membership, L. Prouty, F. Tuckerman, E. Delano.

The society is doing a good work in the face of much opposition, and the determined manner in which its members are striving for the perfection of the game laws indicates that in time the laws of Massachusetts may be as efficient as those of any other State.

FISHERY EXHIBITION PROPOSED.—The Berlin International Exhibition last year and the national one held at Norfolk, England, this month have aroused the interest of the Scotch Fisheries Improvement Association, and they talk of holding an exhibition in Edinburgh next year.

INTERNATIONAL HUNTING AND SPORTING EXHIBITION.—We learn from the English *Fishing Gazette* that an exhibition as above will be held at Cleves, Rhenish Prussia, an 18-hour journey from London. The classification includes fire-arms and ammunition from the earliest to the present time. Dresses and accoutrements for hunters and anglers, fishing tackle, hunting carriages, stabling, horns, hides, skins and articles made therefrom, stuffed animals, birds, etc.

The Sportsman Tourist.

GETTING LOST.

WORCESTER, Mass., Quinsigamond Eyrie, March 18.

AN article in FOREST AND STREAM of Feb. 24, "What to Do When Lost," has called up in me some reminiscenses which, for what they are worth, go to show that the white man is not only liable, but indeed has a natural tendency to get hopelessly lost when once he has passed beyond the limit of recognized landmarks and is without compass or such guides as he may be familiar with in the realms of space.

A pig and an Indian rarely get lost. An Indian may look for moss on the tree trunks, may cast his eyes to the tree-tops, knowing that the higher branches will always bend and take a set from the prevailing winds; but whether he observes these signs or not is immaterial, for ages of necessity have developed in the race an instinct, whatever that may be, by which he instantly and unerringly fixes relative localities.

I have been accustomed from boyhood—which season passed long years ago—to stroll, rod or gun in hand, in the depths of forests or upon plains where at times the vision would sweep a sea of grass for miles upon either hand unobstructed by tree or bush, rock, or swell of land to break the dead monotony. Rivers and mountains, lakes and stream, forest and prairie, desert and wilderness have been my bed-fellows and messmates. From Mexico to the interior of Canada, from Eastport far to the westward I have hunted and fished, but not so much for the hunting and fishing as for the love of the company, the fellowship, of birds and beasts, rocks and rivers, mountains, and seas of wild grass. If I shoot I'd rather my game would be sitting, and I catch trout with an angle worm; but I am a great tramp and would bet on extricating myself from a tangle against anything living except a fox-hound or a cat, a pig or an Indian.

And yet I have been lost many a time, and often under circumstances attended with great danger—in the night during snowstorms, on mountains and prairies, in flooded pine lands that skirt the Altamaha and in the forest.

I will relate one or two instances, but only such as are accompanied by that peculiar, unaccountable tendency to go astray, a tendency attaching itself to both horse and man, as I will try to show.

Men and horses, when recognizable points are out of sight and distant enough, invariably fall to traveling in circles. Twenty-five years ago I bought a prairie farm in the township of Chelanse, fifty-eight miles south of Chicago. I located four miles west of the R. R. station, and nothing intervened but prairie, not a hut nor a tree, not even a trail. To the south nothing—fifteen miles of nothing—saving perhaps the village of Ashkum, and that under a swell and visible only in mirage. To the west, three miles away, was Milk's Grove of fifty acres, and beyond that prairies again for miles, and then Vermillion River.

To the north was a range of hills thirty feet high, and between were two pre-emptions—Bard's—deserted, and one other; and beyond the hills was Kankakee City, then a village of a few hundred souls, ten miles away.

Three of us had been deer-hunting with greyhounds. Had run a herd of six, a brace, and a lone buck, which last we finished with our knives to aid the dogs who had found their match and were hardly equal to their undertaking. It was now nightfall, the sky was overcast and rapidly thickening, and before we had the hindquarters wrapped in the skin and were mounted a fine snow was falling. We put spurs to our horses and with a swift gallop went for the hills, now no longer visible. Ten minutes of hard riding and we were lost—horses and men. Before dismounting we could see Kankakee and knew we were exactly in line for home. But where were we now? We should have crossed the hills at the pace we made, but we had missed them. We could have discerned the inclination, slight as it is, up to this time, but with a little more obscurity all would be level way to us. We halted simultaneously and without word or token. Each felt—somewhere in the region of the stomach—a disagreeable but unspoken sensation. I say stomach, for brains have nothing to do with a lost condition until they are called to the rescue. Attached to this condition is a sort of sickening sensation half-way above the belt—a feeling that with the hardy usually vents itself in a mocking smile, to be dissipated as reason goes about her task. "Where are we?" "I don't know," was answered by two voices, and, in default of others, all agreed to give the horses their heads and trust to them.

On we went, walking our horses and never drawing rein. One—two hours must have elapsed, and we had dismounted to aid circulation, keeping by our horses withers that they might not be influenced indirectly by us, when—Presto! "Hold up!" says one. "Here's that —— buck's carcass."

It was now our turn. No more horse guides for us. We wheeled half about to the right, mounted and set off. The wise one—there is always a wise one in a party of three—acted as guide while neither of the others for a moment disagreed with his direction. Somewhere about midnight, the snow still falling, but very fine and making on the ground very slowly, we came abruptly against the side of a board shanty, but it was too dark to examine it by sight, and the guide dismounted and, running his hands along the eaves and counting the openings, pronounced it Bard's pre-emption.

Now we certainly were right. It had taken us hours to straighten out, but the trouble was all over, and we were less than three miles from home, and knew the points of the compass precisely. Bard's shanty lay east and west from end to end, and I had often at my front door seen the needle lie across Bard's roof at right angles with the ridge. But how had we used up five hours' time at a brisk walk, to say nothing of a ten minutes' lope at a thoroughbred's pace, and gained not more than three miles? It was a puzzle, and as we jogged along we talked it over and theorized upon the inclination of a stray to travel in a circle. We were now moving due south—true as pigeons. There was no wind to aid us, but had we not squared our backs to the pre-emption and never veered to right or left? The way was long and the night was cold. My uncle—the oracle of the party—took out his watch, lifted the crystal side of the case, and after a delicate manipulation of the pointers with his finger-tips and accurately locating the stem, ejaculated: "Four o'clock, by jimeny! Four hours and not three miles yet. I don't understand it, but—" The horses all stopped short, like horses that know their stables. Something had crossed our track. The animals wouldn't budge an inch. It was darker than ever and we could see nothing unless, forsooth, it was extra darkness. The oracle dismounted, walked bump against some object, and we could hear his hands rattling and sliding away from us. And now the sound was lost, but now again it emerged from an opposite direction and my uncle said: "By jimeny! It's Bard's pre-emption." The door fell down and we sheltered there till morning.

I had been with a pair of horses and prairie wagon to Frink's Grove—seven miles away. Frink was the name, and the grove there was none. Two or three thrift-forsaken, lightning-riven, ghostly oaks that, being surrounded by wet pans and dry sloughs, had for a few ages escaped the annual fire, not to mention some lately planted locusts, made up the sum of the grove. I had been for limestone slabs. Limestone crops out at Frink's. I was nearing home with my load—was just one section away and one mile as the hen flies. In front of me was a slough of perhaps two acres. It was not far round the pan, but not so far across it, and I understood sloughs pretty well. Some of them are bottomless pits, but those almost invariably send up near their centres a few scattering black rushes. I could see none here. To be sure it was past sunset, and what was worse, a drizzling rain had set in. But I could see across; I could even barely discern my house, like a shadow in the gray of evening. I drove in. The horses mired, and one that always played me false lay flat down in the mud. Five minutes sufficed to unhitch and lead out one and to whip out the other, carry cross and whiffletree to rear, lock with a chain the horses to the hind axle, go to the end of the pole in four feet of mud to steer—as with a rudder—and so ordered, to shout "Git!" But the horses couldn't start it, and the next thing to do was to carry the stones, one by one, to land and arranging for a start. This time I landed high and dry, but it was too late to reload and so I went on empty.

It had ceased raining but was getting quite dark, and as the way—all the prairie, I mean—was smooth, I sang out in Sucker parlance an emphatic "Git!" and admonished the beasts with braided neat's hide. It got dark and grew darker, and I drove on and drove ever, seemingly, but no landmark that I knew manifested itself to my only remaining sense of discernment—the sense of feeling—for all I could hope for now was to jolt over somebody's breaking. I stopped to take reckonings, for I was lost. A light suddenly flashed out over my larboard bow. There was no mistaking that signal—Mrs. R. had set a beacon light in the window. I knew she would, and I drove on; but it seemed as if the d——l carried the lamp, for I never reached it, and now it went out altogether. A little further on and I halted, took out my seven-dollar Waltham and dexterously fingered out eleven o'clock. But Mrs. R. hadn't forgotten me for, turning round, I was confronted by the glim again—right astern. I must have turned half round since I lost the light. I followed on to disappointment, for again my beacon disappeared but soon re-appeared, though not just where I should have located it. Again I pursued it. I seemed now to travel miles and at last struck upon broken ground, very rough—in Ashkum, probably—and I was full of anything but patience, for I guessed I was seven miles from home and all the lights I had seen were jack-o'-lanterns. I had often watched the *ignis-fatuus* upon that prairie. Striking the breaking I was determined. I stepped down and out, slid off one harness and mounted after loosing the other horse. I had as lief follow that one as any other phosphorescent treachery—but not with wheels over plowed ground.

The light still glared—a fickle, lying, hollow promise—luring me to some new evil; may be to the black swamps of Vermillion—may be into the mire of Langham Creek, most likely—for now on this side, now on that, sometimes in rear, but never in front, it seemed as if a thousand voices had opened from throats that already scented the effluvium that was to arise a week hence from the decaying carcasses of your correspondent and his horses. But I didn't really much care for the wolves. They and I were old acquaintances. I had more than once scattered a pack of them with mud balls. I jogged on, may be a minute, perhaps not half of it. That light stood for me. It was in my house, and I had unhitched just thirteen rods from my own door, at two o'clock by the Waltham.

I started on horseback with a companion from Savannah, with the mixed design of hunting and tramping, making Jacksonville the objective point. We crossed the

Ogeechee at the twelve-mile bridge and ferried the Altamaha. It was now the third day out. We spied turkey tracks in the sand and separated, having previously arranged in case of complete separation to meet at Jacksonville unless chance should bring us together. There were many turkeys. The pine woods seemed full of them. I tied my horse by the road side and for an hour or more heard occasional discharges of fire-arms, distant and more distant, until the crack softened to a tick, and the tick was no more audible. Late that night I took lodgings alone at Trader's Hill, a village of two houses, a store and a blacksmith-shop, on the banks of the St. Mary's. At seven o'clock A. M. I mounted and made for the ferry. The ferryman said my way to Jacksonville was to "take this trail"—a blind sort of cart road that never a cart went over—and a mile below I was to cross a creek and take a bright blaze, which I might follow to a branch (brook), there to take a new blaze which I might follow a mile or so to an old blaze, that would lead to the King's road, an old Spanish road near the coast, thirty-three miles from Jacksonville. Trader's Hill was forty miles from the Floridian city. I struck the trail, crossed the creek, hit the bright blaze, and was soon lost. This country is one vast forest of pines, standing far apart, but with branches interlacing, and with no underbrush whatever. So wide apart are the tree trunks that one may look for half a mile in any direction, or ride at a swift lope with perfect safety, and the things you might meet with were a sand-hill crane, a rattler, a deer, a black bear or a flock of turkeys, and perchance, but quite unlikely, one of those short-tailed grizzly things with unpromising claws and teeth, the thing usually seen curled up in the fork of a tree glancing unamiably right at you. At 3 o'clock that afternoon I struck the edge of a cotton field, and being on the west side of it the cheerful white faces, turned by millions toward me, seemed to invite me down the line which, following, soon brought me to a planter's house. The planter received me respectfully, but not cordially. He knew me for a Yank. He received me dignifiedly, and set his table and stables at my disposal. I partook and thanked him, having learned long before better than to offer a planter compensation.

The gentleman gradually throwing off his reserve, inquired my destination, and informed me I was eleven miles from Trader's Hill, seven miles from the King's Road, and forty miles from Jacksonville, and having set me on another blaze for the aforesaid road I started and was lost in twenty minutes.

Do you think you could have done better? I wish your supper hung for once upon following an old blaze with time short and road long. Inexpert as I was I could have made it out, but I was in a hurry, and that was as good as three pairs against me. That night at 10 o'clock, by a digitallic calculation on the bullseye, I was following the edge of an immense swamp, no slough or bog, but a wooded swamp that something that's astray has an abiding horror of.

Both myself and horse felt absolutely certain that we ought to bear to the right, and sharply, too. Domestic animals and man mutely, but not less intelligibly, mutually communicate thoughts. We both kept bearing to the right, but no, that interminable swamp kept moving up in front of us every time we vered. Again and again we essayed it, sometimes the horse, unguided, and sometimes myself. I felt sure we were moving in a circle by the swamp forcing us to the left.

At midnight we saw a torch-light, and going for it brought up at a cracker's log-house and halted for the night. The cracker said I was seven miles from Trader's Hill, seven miles from the King's Road and forty miles from Jacksonville. The edge of the swamp we had followed lay due east and west, and our wish to turn to the right was the natural tendency to move in a circle. T. C. RICH.

I think it was the year 1864, in the month of March, I went in to Mollychunkemunk Lake to prepare my camps at Angler's Retreat for the spring fishing parties. The camps are situated at the foot of the lake, near the outlet, and are sixteen miles from the Upton settlements and twenty miles from Andover, in an unbroken forest and on the lake north of Umbagog, being a difficult place to reach in the winter season.

I used to store all the provisions I had left from the summer supplies, as also the bedding and crockery, &c., in a room in the centre camp, and lock the doors and nail up everything in the strongest possible manner, not only to keep them from wild beasts, but also from any vagrant biped who might stray so far away from human society. It was not only expensive, but difficult to freight in supplies over Umbagog Lake up Rapid River and over the roughest carry for four or five miles on a sled in the summer time, therefore we were the more careful to take care of every pound weight possible.

On approaching the camps I found they were open and everything in disorder—the wood burned up and the provision room broken into, and considerable of it gone. The bedding was all disarranged and overhauled, showing plainly that some one had camped there quite a while.

Presently I discovered a piece of paper tacked up on a post in the camp, and in a fair handwriting the following words:

"CAMP RICH, AT HEAD OF RICHARDSON'S LAKE, NOV. 6.

To who may read this, sir or sirs:

Should I not be able to get away from here be kind enough to notify my friends or at least my father, the Hon. Peter Edsall, No. 16 Morton street, New York city—that is, should you find me dead. By examining papers in my pockets you will find out how I came here and my business. Yours truly,

WM. H. EDSALL.

After reading the above I immediately made a thorough search for the body, both indoors and out, fearing the poor fellow had perished in this lonely, faraway place. But I did not then, and neither have I since, in all these seventeen years, been able to learn the least tidings of any such a person. J. C.-RICH.

Bethel, Maine, Feb. 28, 1881.

MINNESOTA DEER BUTCHERY.—The Long Prairie, Minn., *Argus*, says that, "In Ward and beyond parties are butchering deer in a disgraceful manner. Some of the deer are so poor that they can scarcely stand, and yet these bones are relentlessly pursued on snow shoes and slain." Commenting on this abomination, one of our correspondents writes: "The inclosed slip I ask you to insert in your influential journal for the sake of humanity and civilization, as I feel certain that no right-minded man or woman can regard the abominable butchers with any other sentiments than those of loathing and execration. The snow here is yet a foot deep on the level, while many huge drifts are from five to eight feet high."—M. J. E.

OUR LAST MATCH.

HAVING read many hunting and fishing adventures in the FOREST AND STREAM, I contribute one of my own which occurred to a party of three, including myself, while on a hunting expedition in Colorado last October. We left our wagon in Estes Park and packed our outfit on a couple of mules and a pony up to the head of Black canyon and camped at the foot of the big lake at the head of Fall River, a well-known stream which runs through the park. Our camp was made nearly at timber line, and above were bold, bare peaks and huge snow banks which must have been there as long as the mountains themselves. The mountains in that section are very rugged and cut up by deep canyons, so that one has to keep a sharp lookout when going any distance to avoid difficulty in returning to his camp. A man may be familiar with one side of a huge peak and think he would know it if he were miles away, but let him change his location a few miles and it will look strange and entirely different. It is the same way with snow landmarks. One may pass down a small valley and see half a dozen large snow banks on either side, and then a day or two later enter the valley from a different direction and proceed up and nothing will look familiar. Then several canons will head close together and lead in different directions so that you can hunt up one to its head, turn around a few times and start back down another and think you are in the same one you went up when in reality you are going in another direction. This will show how easy it is for any one not familiar with the country to get lost, especially in the night.

On the third day after arriving we all started together in a northerly direction to look for bears. And let me say right here that we do not hunt, range grizzlies with shot-guns and squirrel shot, and when one is met on a bare mountain and a gun goes off the hunter always gets the bear, or the bear gets the hunter. So we always kept together, for three men with breech loaders and magazine guns can keep a streak of lead in the air hard for any animal to face. We got off about 9 A. M. in a northerly direction and as the sun was shining brightly and the day promised to be warm I left my coat in camp against the advice of the boys, who said it might get cold before our return. We tramped around until about 3 P. M. killing nothing but some snow quail, which at that season were spotted—about half white and half brown. Later they get to be snow white. At this time we could look down upon our camp from the mountain where we were, but the sides was so steep and rugged that it was impossible to get down without going to the upper end of the valley, the way we went out, or else going down and coming at the lower end. We decided on the latter route and started that way. After going a short distance we came to a deep canyon and had to make a long detour, and before we got around a cloud settled down over us enveloping the mountain in a heavy fog-like mist, so dense that we could not see objects over twenty feet. As this caused the sun's rays to disappear, it began to get cold and before we realized our danger night came on, and we were out in the cold on a dark night, tired and hungry. I was sure I knew the direction of the camp, but my companions were equally certain it was in an entirely different direction. So we went wandering on

It was getting very cold, the wind which came up after dark blowing keenly and penetrating to our very bones. Then Tommy, the biggest and stoutest one of the party, gave out and we had to carry his gun. It was so cold we could not stop and not a particle of wood of any kind. Finally we came to a sort of valley and concluded to follow it down and find wood and camp. At last we came to a patch of scrub-oak about two feet high, and prepared to make a fire. A search of all our clothes revealed six matches. Some twigs were gathered, a match struck, which went out, and no fire. Four times more was the same thing repeated with like result. We knew the other would go the same way, and so decided to keep it until our return to camp the next day, so as to be able to make a fire there. Then the fact began to strike us forcibly that we were in for a night on the mountains, too tired to travel, and too cold to be still. Once we all crawled into a thick bunch of bushes, myself in the middle, and tried to snuggle up close and keep warm. But it was no go, the ground was hard and stony, and lie any way I would the top side would soon get so cold that I would have to change my position.

Finally this became unendurable and we crawled out and went on a little farther. Then we stopped at another bunch of brush and sat down out of the wind and shivered. I took the match out of my pocket, and after considering the chances, said: "Boys, this match will not do us any good to-morrow, for we will all freeze to death before morning." Tommy produced quite a large piece of flour sack which he had in one of his pockets and proposed trying to start a fire with that. Lucky thought! The match was struck, the cloth blazed up and we laid it on the ground and put a few twigs on it, but the blaze went out and with it our hopes, almost. But as the cloth smoked and smouldered we commenced to blow and fan it, and the way we did work! One would blow until he could find no more breath, then another would try it, and then we would blow all together, until at last the twigs began to get red, they blazed, faint at first, but by careful nursing a fire was started. This we moved to a bunch of brush and soon had a fire blazing five or six feet high. The night kept getting colder, until toward morning we could hardly keep warm around the fire, except by changing our positions so that first one side would be warmed and then the other. When the sun came out in the morning I was about played, but the others felt better. Tommy went up on a high peak to take a look and came back and said he did not know where we were, as everything looked strange. So we decided to follow our back trail, knowing we could reach camp that day. This we did, arriving about 2 30 P. M. Everything was all right, and the fire we had left burning the day before had spread to a bunch of brush and was smouldering when we got there. We soon had a fire going, coffee put on and also the camp kettle, which contained some grouse and potatoes and plenty of broth. We broke our thirty hours' fast with soup and coffee, and wound up with bread and meat. The next day a big bull elk came pretty near into camp before he knew it and we all commenced shooting at once. He got off quite a distance, but finally went down after being hit six times. The day following we butchered a 300 pound grizzly in pretty much the same way. All commenced shooting at once. He felt at the first fire, then got up and made the mountains echo for a minute and tried to get to us, but it was no use. We shot as long as he kicked, and gave him one or two after he quit to make sure of his not playing possum.

I have been out in pretty cold weather, but think our night above timber line was a little the coldest I ever knew. There is little doubt but for our "last match" we would all be up there yet, frozen solid, perhaps serving as curiosities in a side-show conducted by some enterprising old grizzly Barnum. We afterwards found that the place where we spent the night was within a mile of our camp, with only a low divide between. C.

ANOTHER TOUR IN THE PROVINCES.

IF any one of your million readers has ever chanced to see a book published a long time ago, entitled "Stewart's History of Prince Edward's Island," and thinks he will frame a sporting tour on that excellent and really—for its time—most reliable work, he will find himself frightfully mistaken.

Stewart states to the effect that the Province of Prince Edward's Island in the "Gulph" of St. Lawrence abounds in game, large and small; and as to fish, you or any other man have only to drop a line in the shape of a crooked pin on the end of a string to catch any unpiven quantity of fish such as sea cows, seals, sturgeon and bass, with salmon (Richardson's and the other kinds), sea trout, river trout of colossal proportions, smelt and every other phase of the *Salmonidæ*. In fact, Stewart, and later people who have cribbed from his book, say that Prince Edward's Island offers a paradise to the sportsman and angler.

It don't

In the pilgrimage that it is my lot to make frequently throughout the length and narrow width of the island now miscalled by the name of the otherwise forgotten Prince Edward—(please to understand that I am not a book agent and I repudiate chromos with scorn), I have been really sorry to see several American gentlemen who looked like sportsmen excepting that their fit-out seemed too awfully expensive, trying in vain to find where the paradise of gaming and fishing came in in this Province of ours. That is the main reason I now write you.

Game there is none to speak of now in Prince Edward's Island. Antlers of deer have been plowed up, showing that good sport was once upon a time. Flint arrowheads, both of war and the chase, have been given to me from several localities, indicating a stone era long ago down into the abyss of ages. An archæologist might take some interest in a locality that I could show him where the flint arrowheads that have been dug up within the range of an arrow's flight show a perceptible difference of construction. The defendants were evidently the occupiers of the soil, the now effete, but then not unpowerful nomadic sept of the Mic Macs; the plaintiffs were the Mohawks—those Indian Normans who beached their long galleys on the hards of Mimmigash Creek here on our *Prospero's* isle. And, strange to say, in the inner consciousness of the remnant of the Mic Mac tribe now living on Lenox Island, here lives an unwholesome dread of the bogy "the Mohawk!" Once your present correspondent was privileged to hear a Mic Mac mother say to a papoose strapped Italian fashion to a shingle: "*Ukicis ecumiuty mijrpgaier Abogee Moaunkeove-hoo!*" or words to that effect, which being freely rendered may read: "You little brute, if you don't shut up I'll give you to the Mohawks to eat!" The remark was followed by a sort of rhythmical cadence that sounded not unlike the white-gloved applause at a successful opera. But I must confess that my unwritten legends of the Hiawatha type are mostly derived from an Indian of my own, now in the happy hunting-ground—where, in the present scarcity of game, I rather confess I have half a wish to be with him—and whom once upon a time in camp I reverently christened out of *Blackwood's Magazine* by the Christian and surname of Tony Butler.

To resume: The Province of Prince Edward Island is a long, narrow, stoneless bank of earth, one hundred and thirty miles, more or less, in length, by a width of eight to thirty-five miles, and completely fringed with tidal estuaries, in which, at the right season, is always not bad sea trout fishing. "The Island," as we islanders love to call it, has been unnecessarily called "the garden of the Gulf." No greater height on any part than thirty to eighty feet prevents the whole thing from being washed away. The soil is the loam of fruit-bearing Devonshire, England, and from what is told to the undersigned not unlike the earthy part of that New Jersey, where early frosts always kill, by telegraph, all the expected peach crop.

In such a strip of land, barely showing above the surrounding sea its crown of green fields, dotted here and there with the *coniferæ*, that are now almost the only suggestion to remind that before Cabot came drifting along this was an isle

That on its summer shade of trees
Lay all afloat,

it cannot be expected that there should be any rivers. There are none. The temperature of the running waters over shallow depths is too tropical for salmon. Trout, however, are to be had—in holes.

It is now two years and perhaps more since the present Canadian Minister of Fisheries came into office and at once took decisive steps to redeem from utter fish-exhaustion all the waters of that smallest of the maritime provinces that made the largest show in ciphering up that most reluctant $5,500,000—meaning, of course, Prince Edward Island.

The fishery officers now state that the number of trout in the small but innumerable angling streams has certainly doubled during the past two seasons of close protection. I know whereof I speak in saying that there is reasonably good sport for a reasonable number of legitimate trout rods.

The only thing further to be remarked is that it would not be best to land upon the Island shore from the Gulf steamer and go wandering around with one's rod on one's shoulder, looking at all the horse ponds, without having previously arranged one's route. Perhaps your present correspondent might suggest that if any really enthusiastic angler would like to try the little purling trout-brooks of Prince Edward Island (trout only) at a total expense for rough accommodation—ex-transport—of scarcely over $2 per diem, including small boys as missionary guides, he had better consult beforehand with the fishery officer for the Province whose name recently appeared with the other fishery officers of the continent in FOREST AND STREAM. As probably that designation of the party referred to does not live in the minds of his contemporaries, his address is: Col.-Duvar, Alberton, P. O., Inspector of Fisheries for the Province of Prince Edward Island, Canada. D.

DEATH OF MR. COBB.—Warrenton, Va., April 6.—Please notice death of the elder Cobb, discoverer and proprietor of Cobb's Island, Va., who died March 26, 1881, aged 81 years. Many sportsmen of the United States will remember him as a splendid hunter, a man wise in sporting lore, and withal a good recounter. He was buried on the Island that he found, and in the blasts that sweep over his grave—which come from the ocean—mingled with the cry of the gull and sea mew, he will sleep sweetly, An honest, true-hearted man.—CHASSEUR]

BRANT ROCK.

THIS pleasant summer resort is situated on the eastern coast of Massachusetts, in the town of Marshfield, Plymouth County, and during the hot months is visited by many of the inhabitants of our inland towns and villages, who find rest and enjoyment in boating, bathing and other sports to be found at our seaside watering places.

Brant Rock, from which the village takes its name, is a rocky headland projecting several hundred yards into the ocean, and connected with the mainland by a narrow strip of beach, which at high water is completely covered, making the rock an island. I am not sure as to how it received the name, but have been told that in olden times great numbers of brant were shot at this point, and on that account it was so named. In the fall when the coots, geese and other wild fowl commence their southward flight, Brant Rock becomes to me a place of the greatest interest, and about the first of November generally finds your correspondent upon the spot. At this point are three good hotels, with their billiards and bowling to pass away the dull days that will always be encountered at gunning stations. Then, again, you can always be sure of good accommodations, good boats, and men that understand the business to handle them, if desired, at reasonable prices.

After an easterly wind there is generally quite a surf on the beach, which makes it lively for the gunners and affords much fun for the lookers on, who watch the boats land after a day's shooting. It is exciting to see them come on in their light dories, over and through the breakers; some of them coming to grief and wading ashore with their boats bottom up.

The shooting is mostly from boats, although in rough weather there is sometimes good shooting from the point of the Rock. In boat shooting the boats are anchored in line about two gun shots apart, the line extending a mile or more to sea. Sometimes there are so many boats that they make another line in the rear, or to the southward of the first line. I have counted fifty-one boats anchored in this way, and have been told that it is not uncommon to see many more. The boats start about daylight, and after considerable manœuvering get placed in line, and if a good day the shooting begins about "sun up." Flock after flock of old white-wings come down through the line, followed by sheldrakes, quandies, and, in fact, all kinds of fowls that frequent our shores. Occasionally an old loon comes bearing down, and after receiving volley after volley, looks us calmly in the eye and keeps on his way.

An old gunner, if not used to this shooting, will look blue after trying a few times. The motion of the boat in a sea, together with the swift flight of the birds, make this kind of shooting the most difficult I have ever attempted.

You have made two or three poor shots and are getting discouraged when down comes a bunch of coots. You make up your mind you will redeem yourself, and lie low until they are in easy gun shot. You raise the gun when a sea cants the boat, and you wildly wave the muzzle of the gun at them, and in the jumble both barrels are discharged and the chances are the charge comes nearer the next boat than the birds. Such is coot shooting as experienced by a green hand in a heavy sea. Even the most expert will miss the most provoking shots, and it takes a good shot and a tremendous sight of luck to make a decent show. Loon shooting is the handsomest shooting if one can only get the hang of it. They are not wild, and give good shots, but are extremely hard to kill and will carry off a lead mine.

Last fall I was at this place gunning and we had one day that Andrew, Nat and Rube will not soon forget. We went out at daylight, and at sunrise loons commenced to fly. We had them for two or three hours as fast as we could put the shells into our guns, Andrew using a heavy ten bore, while I used a twelve bore eight-pound Fox gun, altogether too light for such shooting. Andrew killed three pair straight, but I was nowhere. I emptied about fifty shells and got about six loons, which was about one-fourth of what fell in the water, but could not get. Andrew was more used to it. But bringing them down and getting them are two different things, and out of all he hit he probably got one-fourth. When coots did not fly we took Andrew's old fox hound and in a few hours' tramp generally managed to start a fox, which would elude the dog during the day, leaving us to tramp home empty handed. But such was not always the case as two skins hanging in Andrew's cabin will testify. At other times we would tramp the pastures and stubbles for quail, of which there was an abundance last fall.

I know of no place in this part of the country where a man can enjoy himself better. It is distant from Boston about thirty miles on the Duxbury branch of the Old Colony Railroad. Get off at Marshfield depot and a coach carries you to the Rock, about four miles. On arriving there Captain Churchill or Mr. Brown, of the Brant Rock House will take good care of you, and Bill Tallman or Rube Bates will carry you out and give you as good shooting as the weather and birds will permit. To a visitor this part of the country is full of interest. The home of Daniel Webster is in sight, and although the old house is gone, the very trees and stone walls seem to speak of his presence. It is only a few days ago we drove a fox directly through the little burying-ground down the large orchard that was once Webster's pride. From the high cedar hills near by we can gain a view not often seen. To the southward in the distance we see the monument on Captain's Hill, erected in memory of Miles Standish, while beyond is the city of Plymouth. To the left is Clark's Island, and beyond loom up the dark hills of Manomet. Looking seaward on certain pleasant days Cape Cod may be seen, eighteen or twenty miles distant, while to the north a landscape of forest, stream and sea meets the eye.

If all prospers, I hope in another year to meet my friends at Brant Rock, and try the white wings again, and give that sly old fox a run. RAMROD.

Holabird Shooting Suits. Upthegrove & McLellan, Valparaiso, Ind.

Hop Bitters gives good digestion, active liver, good circulation and buoyant spirits.

MR. E. DUNCAN SNIFFEN, the well-known advertising agent of this city, has removed to No. 3 Park Row, where all evidences go to show that his business is prospering. Mr. Sniffen is energetic, capable, trustworthy and, as a matter of course, popular and successful.

WISDEN'S CRICKETER'S ALMANAC FOR 1881. This record of the full scores and bowling summaries of the principal matches played in 1880 has been sent us by the publishers. The book contains 228 pages replete with most useful information and should be in the hands of all lovers of the game of cricket. John Wisden & Co., London, England. Price one shilling.

HOW WE FED THE BABY, to make her healthy and happy; with health hints. By C. E. Page, M. D. 144 pages. Paper, 50 cents; cloth, 75 cents. New York: Fowler & Wells, 753 Broadway.

Natural History.

DOMESTICATION OF A SIBERIAN DEER.—The young horns of a certain Siberian deer (*Cervus maral*) while they are yet filled with blood and before they have become ossified are highly prized by the Chinese, who purchase all that they can obtain of them on the Siberian frontier, paying the high price of from six to twenty pounds sterling per pair for them. In consequence of this demand for these horns the Maral has been very eagerly hunted, so that it is now rather rare. The Cossacks near Kiakhta, some time since, attempted the domestication of this deer, and it is said that the domesticated animals have of late greatly increased in Western Siberia, and that some of the herds now number seventy individuals.

SENSE OF SMELL IN INSECTS.—An interesting paper on this subject has recently been published by Hon. Gustav Hauser, of Erlangen, in which he gives an account of a number of experiments made by him. A number of different species of insects which had been induced to approach vessels containing turpentine and acetic acid showed, by their evident desire to retreat and by moving their antennæ, a decided perception of the odor but after the extremities of the antennæ had been cut off the same insects, placed close to the vessels, manifested no uneasiness. A number of flies which had approached a piece of putrid meat showed no desire to return to it after the third segment of the antennæ had been cut off.

CATALOGUE OF THE BIRDS IN THE BRITISH MUSEUM.—It is said that the fifth volume of the Catalogue of Birds in the British Museum will soon be published. The families described in it will be the Thrushes and Warblers, and the work will be done by Mr. Henry Seebohm, who has devoted several years of close study to these groups, and who is one of the highest living authorities on them.

SPRING SNIPE.—A correspondent who writes from Wading River, Suffolk county, N. Y., under date of April 4, says:—

Thisday I found a brace of English snipe on the meadows and killed them. The female contained the inclosed specimen which I believe to be the eggs. I would like to know how many eggs they lay and when they nest.

The Wilson's snipe builds its nests on the ground in meadow land, usually not very far from a damp or wet spot; the eggs are four in number, clay colored, spotted with black. By far the greater part of the snipe which stop with us in spring pass on beyond the borders of the United States to breed but a few remain with us, nests of this species having been found in Connecticut, New York, New Jersey and Pennsylvania. The specimen sent us was a mass of the undeveloped eggs of the bird. We have seen snipe killed late in the spring which contained eggs as large as the end of a man's thumb, and have heard of others in which have been found eggs ready for deposition.

A HAWK NEW TO THE UNITED STATES.

SMITHSONIAN INSTITUTION,
Washington, D. C., April 6, 1881.

Editor Forest and Stream:

It affords me great pleasure to be able to announce through your columns the addition to the United States fauna of a species of hawk hitherto not recorded from any point north of Mirador, Mexico. The question of what name the species should bear is one involving considerable investigation, pending which I will call it, provisionally, *Buteo fuliginosus*, Sclater. It is a small species, about the size of *B. pennsylvanicus*, but with longer wings, and of a uniform black color, like *B. abbreviatus*. It has been considered by various writers to be a dark or melanistic phase of *B. brachyurus*, but in this view I cannot concur, no specimens among the many which I have examined, indicating that any light colorphase exists; both young and old, though otherwise quite different, being uniform black below as well as above.

While premising that this bird *may* be the *Buteo fuliginosus* of Sclater, it should be remarked that in "History of North American Birds" (vol. iii., p. 266,) I referred this name to *B. swainsoni*, on the presumption that it was probably based on a small example of the latter species in the dark phase of plumage; but I may have been wrong in this determination.

The specimen in question was shot at Oyster Bay, Florida, Jan. 28, 1881, by W. S Crawford, and was secured for the National Museum from W. H. Collins, of Detroit, Mich.

Very respectfully yours, ROBERT RIDGWAY.

MIGRATORY QUAIL AND HOUSE SPARROWS.

QUEBEC, Canada, April 7.

I HAVE again ordered 200 migratory quail for this neighborhood which, I have no doubt will arrive in good order. The point, however, as to the fact of this variety of quail returning with the other spring birds does not appear to be clearly established, so I shall be obliged to some of your numerous readers to record what they may observe this year on this very interesting subject.

The winter in Canada has been less injurious to house-sparrows than usual. Our inhabitants have noticed this bird is a good bird. "*It suit la religion, it visite les clochers, les convents et les Presbyteres,*" and is therefore in a fair way for salvation.

The imported quail again recommends itself to our farmers as a bird that lives in France, they do not know the word "Caille," but they understand it is a little partridge and a French bird, so on the principle of the Irish sparrow they are quite prepared to give quail every protection.

My idea is if we can once get quail established on the Laurentides to the north of Quebec the bird may become as numerous as robins or crows, but spring shooting must be discontinued all over this continent, otherwise all the migratory birds will disappear. As the common bird of America is now the house sparrow all the others appear to have vanished and as the house sparrow only lives in towns where there are horses and stables the country places are very bare of birds.

I have no birds on my farm, and the same complaint is general with my neighbors, and during a hunt I made last winter I only saw three partridges (ruffed grouse) in four weeks. W. RHODES.

THE PINE GROSBEAK.

THIS interesting bird is, if we may credit the reports, an abundant, although rather an irregular winter visitor to Massachusetts. It must be remembered that very few of the many persons who may have observed the bird are possessed of sufficient ornithological knowledge to tell to what species it belongs, and but very few of these who know it ever publish their notes. This, taken with the fact that, except observations are confined almost exclusively to the vicinity of dwellings, owing to the difficulty of getting about in the woods at the only time that it is present with us, leads to the conclusion that it cannot be other than quite an abundant species in our pine woods and other places where it is able to procure suitable food during the winter months. Dr. Coues gives its habitat as follows: "In this country it occupies the whole of British America, migrating regularly into the northern tier of States in winter, and occasionally to Maryland, Ohio, Illinois and Kansas. Apparently resident in the Sierra Nevada, of California, and certainly so in the Rocky Mountains within the United States, south to Colorado, where it breeds."

There are also well authenticated instances of its breeding in Maine. I have observed the species in this vicinity every winter for the last five years, while it is unusually abundant this winter throughout the State. West of this village there is a large tract of flowed land constituting part of the pond known as the "reservoir." This tract contains a superficial area of about two hundred acres, with an average depth of about four feet of water, which is so completely choked with aquatic vegetation of many species, some floating and others firmly rooted, as to be impenetrable for any distance for man, except in two paths made in the winter, when the water in the reservoir was "down," by lumbermen for getting out wood from the heavy growths beyond the "swamp," as this place is locally designated. This makes a natural retreat for large numbers of wood ducks, black ducks and many water and other birds that like the vicinity of water or find here the food most suited to them. And the food which seems to be the chief attraction is the seeds of the black alder (*Ilex verticillata*), this being the most abundant plant in the swamp. It is so abundant as to present the appearance to an observer on a neighboring hill of a level meadow covered with this shrub, showing occasional patches of water.

The seeds and berries of this plant form no inconsiderable part of the food of the wood ducks which resort here in flocks for food and to roost, coming in from the ponds in the vicinity after sunset, sometimes as many as fifty being counted in a single flock. Although most writers tell us that the wood duck is seen in flocks of from three to twelve only, yet I have frequently seen flocks of twenty to thirty fly in after sunset and leave again early in the morning.

Besides the wood ducks there are many other species of birds which feed on these berries, including the subject of this sketch. I have noticed them here every year when the berries were left in the bushes until winter. In the fall of 1879 the berries were very plenty, and the water in the reservoir and swamp having been kept "up," there were unusual numbers of ducks there feeding on them After the patch was covered with ice there were no berries and I saw but one small flock of grosbeaks all winter. Whether the ducks stripped the bushes so that there were none left for the Grosbeaks or not I do not know, but I firmly believe this to be the case, for last fall the berries were no more abundant than in the fall of 1879, but the water in the swamp having been down so that the place was dry or contained but very little in the reservoir all the latter part of summer and fall, there were no ducks, and the bushes have been loaded with berries all winter and have formed almost the entire food supply of an immense flock of grosbeaks

I first noticed these birds on the 12th of December, the weather having been quite cold and the ground covered with snow for twelve days previously. From this time my visits to this place were quite frequent, and I have never failed to find them here at whatever time of day I came before 4 P. M., at which time they usually retired to the woods to roost. All the winter they have been here, although the cold has been very severe, the thermometer registering below zero on fourteen days during the month of January. The mean of three observations each day—morning, noon and night—during this month was 16 degs. In spite of the cold they spent most of their time in this bleak, unsheltered spot, exposed to the full force of the wind, subsisting entirely, so far as I was enabled to know, on the seeds of the black alder.

At the time of my first visit to the birds in the "swamp" the flock consisted of twenty individuals and had no material increase of numbers for three weeks, when they began to receive additions until, about the 15th of January, the flock numbered as many as three hundred. About the 1st of February they began to disappear until, the 20 h of that month, a diligent search failed to reveal a single bird of any species in the swamps, but since then I have seen them in other situations. Saw a flock of seven feeding on the larch trees in front of a residence on the main street of the village on the 18th of March and, although there were teams and pedestrians constantly passing, they remained undisturbed for nearly two hours, quietly feeding and uttering their peculiar whistle, the only sound I have heard them make.

The grosbeak is in many respects a very peculiar bird. It seems to be totally unsuspicious of man. I have been able to walk up to within four feet of the flock when feeding on the bushes, when I could easily have touched them with my gun. I tried the noose on the end of a pole, as described by Mr. C. J. Maynard, and although I caught none, owing to the numerous twigs and small branches catching in the noose, I had no difficulty in touching them with the noose, they manifesting no concern, but continuing to feed, although the pole to which the noose was attached was only seven feet long.

They seemed to regard my dog, who sometimes accompanied me, with more distrust, often circling about him and uttering their plaintive whistle and seeming very uneasy so long as he remained in sight. They are very sensitive to noise. Although they manifested so little concern at my presence, the report of a gun would send them into the air in a body, to circle and manœuvre about for several minutes, when they would alight, sometimes in the very place from which they started, and at others in another part of the swamp; and although I shot among them several times to

obtain specimens for preservation, they seemed to learn nothing from experience, but would allow me to approach as closely as ever.

After the snow became so deep that I was compelled to wear snow-shoes to get to them, the "craunching" of the crust under the shoes was a source of great uneasiness to them and I was unable to approach as closely as before. They would feed as unconcernedly as ever until an unusually loud "craunch" would cause the whole flock to take wing, the flight being led by no one in particular. Indeed, during my observation of this species I have never noticed any trace of that tendency to follow a recognized leader, which is so prominent a trait with many birds. They show no sympathy for a dead or wounded comrade, often feeding within a few inches of such without manifesting any concern whatever. There was in constant attendance upon this flock, the first three times that I visited it, a small hawk, of which they manifested a wholesome dread, but I gave him a charge of number eights upon a favorable occasion, after which I saw no more of him.

The grosbeaks are quite indifferent climbers, showing no more agility on the small limbs than a crow. I have seen them on the ground feeding on the seeds which had fallen from the bushes above.

Some writers have accused this bird of eating the buds of fruit trees, and one at least has said that buds form their principal food I have dissected many of these birds and have yet to find the first sign of a bud of any kind. I have watched them closely while feeding on apple trees and have never seen them eat anything while there but the apples left on the trees the fall before, and have even seen them descend to the ground for these. I have never seen anything in the habits of this beautiful and interesting bird which should lead us to regard it as other than a very welcome winter visitor. CHAS. E. INGALLS.

East Templeton, Mass., April 4.

THE RATTLESNAKE AS A TREE-CLIMBER.

FORT WALLA WALLA, W. T., March 23.

Editor Forest and Stream:

As I have not had anything to say to you for some time, and now seeing a good chance for an item, please note what I know about rattlesnakes climbing trees. To put the matter concisely, let us say about the rattlesnake commonly found in the West—the *Crotalus lucifer*—of Baird & Girard. This species at any rate does climb, now and then; if not on large trees, at any rate on sage bushes and small willows. I don't mean to say either that it is a constant habit of the species—I do not believe it is, but rattlers are found now and then in such situations. Here is one instance at least, and I have a witness for it in First Lieutenant Chas. E. S. Wood, Twenty-first Infantry, now stationed at the Military Academy at West Point, New York, who undoubtedly remembers the occasion, as I showed him the snake in position on a small willow tree, probably about five feet from the ground, before shooting it. I told him at the time that I might want him to verify the occurrence, and here is your chance if you have any doubts about the facts. Lieutenant Wood and myself were returning from a hunt after dusky grouse in the vicinity of Camp Harney, Oregon, some time in the latter part of August, 1875, I think, following down a small mountain stream called Rattlesnake Creek, along the banks of which a number of willows and cottonwoods grew. The willow on which the snake was found was somewhat leaning toward the creek and was probably three or four inches thick. The snake had worked its way up into a fork about five feet from the ground and was coiled up there and rattled as I passed it. This attracted my attention, and before disturbing it I showed it to the lieutenant.

What the particular inducement was to cause the snake to climb in this instance I can't tell, as there were no birds' nests or anything of that sort on the willow in question or in the vicinity, as I examined the surroundings closely after shooting the snake. The snake was not over three feet in length, and had only five or six rattles.

On another occasion I saw a rattlesnake in a sage bush near Owens Lake, Sage County, Cal., but the bush was not over two and a half feet high. There are exceptions to every rule, and here you can have at least one well-authenticated instance where a rattlesnake climbed, if not a tree, at least a good sized willow. CHAS. BENDIRE.

EVENING GROSBEAK IN WISCONSIN—Fon du Lac, Wis., March 23.—I send you as close a description of a bird recently shot here as I am capable of giving, and regret that I am unable to send you a skin, but have already mounted mine: Male bird; length, eight and one-half inches; bill, greenish yellow, very large and heavy. Top of head black, front of head bright yellow extending in a narrow line over eyes. Neck, dark olive brown extending down until blended with the bright yellow of the belly and back. Rump, pure yellow; wings, four and one-half inches long, exterior coverts black, those near the body pure white; tail and upper tail coverts deep black.

Should I succeed in securing any more specimens I shall take great pleasure in forwarding skins to you. I am an enthusiastic sportsman, and very fond of observing habits, etc., of birds and animals. I shall in a few days send you a detailed description of a strange bird shot here some time since, and now in the cabinet of a local collector. It has so far puzzled all our collectors in this vicinity. Should any other interesting natural history notes occur I shall take great pleasure in sending them. AGILES.

We are inclined to think the bird was an evening grosbeak (*Hesperiphona vespertina*). Shall be glad to indentify your strange bird, and to hear from you when ever convenient.

LARGE MOOSE ANTLERS—Halifax, Nova Scotia, March 24.—I inclose the photograph of a moose head now in my possession, which I consider the largest yet killed in this province. I would like to hear if any of your readers have ever seen one of equal size. I can find no record of any as large ever before having been killed in Nova Scotia. The horns are well proportioned and nearly equal, one side having nineteen points the other seventeen. The pan or palmated part entends well on both sides and over the front. The head was killed last season in this country. The following are the dimensions of the horns spread from tip to tip: Five feet six inches (or sixty-six inches); from point of brow antler to top of horn, three feet four inches, or forty inches; width of pan from twenty to thirty-five inches.—THOMAS L. EGAN.

The antlers form a pair of the most suberb specimens ever coming to our notice. We should be pleased to hear of other records.

A SNAKE-CATCHING KING FISHER.—The interesting account which we print below of the capture of a snake by the "laughing jackass," a large Australian king fisher, is taken from the New South Wales *Albury Banner*. It is as follows:

It has long been a matter of popular belief that the great king fisher was an enemy of the snake, perpetually warring upon the tribe in general, and never happier than when dining on serpent *au naturel*. It is not often, however, that even persons habitually residing in the bush have so good an opportunity as that afforded a few days since to Mr. Christian Westendorff, of Jindera, for observing the laughing jackass when in the act of bagging the game referred to. Mr. Westendorff was engaged with another man in clearing some land, and in the course of the day's operations it became necessary to shift a large log. For this purpose levers were applied to each end, and after some straining the log was rolled from its resting-place. The very moment it commenced to move, a laughing jackass, which had hitherto been taking a deep but unobtrusive interest in the proceedings, made a swoop down from the limb of an adjacent tree and seized a large snake which had been lying under the log. The snake was gripped by the back of the neck (if snakes can be said to have necks) and borne away to the bird's previous perch, where the unfortunate reptile was banged against the bough until the body separated from the head and fell to the ground. The jackass then dropped the head, and seizing the body sailed away in triumph with his prize. Whether the bird had seen the snake go under the log and was watching for it to come forth again, or whether it knew by instinct that the reptile was there, is a question which may be left for naturalists to determine, but we are credibly informed that as soon as the log was shifted, and before Mr. Westendorff or his companion had any idea of a snake being in their neighborhood, the jackass was down and had made good his seizure.

A CAT'S LONG JOURNEY—Bangor, Me.—I am well aware that cats are not game, and are reckoned as "neither flesh nor fish, nor good red herring," and so have no legitimate standing in FOREST AND STREAM, yet the recording of a pedestrian feat recently performed by one in this vicinity may interest you to admit her into your columns as a poacher on your manor.

A gentleman in this city had presented to him a Maltese cat with four young nursing kittens by a former friend living fourteen miles out in the country. This cat and her kittens were placed in a close covered basket inside of which was a blanket in which they were wrapped, and the whole then covered with a thick rug. The basket and its contents were then brought in a waggon to this city the distance stated. The cat and her kittens were kept in a room in their new home, and carefully watched, fed and petted for seven days she appearing to be wonted and content. On the morning of the seventh day she and her kittens were seen at their new home for the last time and were missed very soon after. The following day at noon she appeared at her old home with all her kittens. She did not return by the road, the way she came, as she was seen by several persons going through the fields with a kitten in her mouth. Allowing thirty hours to have elapsed between the time she was last seen at her new home and the time she was first seen at her old home she must have traveled a distance of 112 miles, carrying a kitten one-half the same distance. J. C.

"TAILING" A SKUNK—Rockland, Me.—A young man earned a quarter and made himself a hero by removing a skunk from an entry at the head of the stairs in a building on Main street. The skunk was master of the situation, preventing ingress or egress to the offices and tenements on that floor. Our hero coming upon the scene, approached the passive end of the skunk, and moving his hand in front of the skunk's nose to take his attention, he reached over him, seized him by the tail, carried him an eighth of a mile and threw him into the dock where the boys finished him with stones When I came upon the scene he had just returned and was inviting the public to smell of him. I with a few hundred other citizens accepted of his kind invitation, and I can testify under oath that he was as sweet as a nut.—TRUTH.

[Take a bull by the horns and a skunk by the tail.]

Game Bag and Gun.

CATCHING RABBITS IN SIBERIA.

BY XIL YORRIS.

ROMANOFF is a Russian and a Nihilist. Banished to Siberia he was fortunate enough to escape after a time and became a diamond hunter in the south of Africa. He failed, however, to discover Koh-i-noors or great moguls, and went to the gold mines of Australia and from thence to the Black Hills. He drifted over the earth wherever he could hear of gold or gems. A perfect cosmopolitan, thoroughly educated and informed, a Hercules in strength and able to curse the Autocrat of all the Russias in half the languages in Europe, he was gentle as a child, and his voice was musical as running waters. I believe he would have made his fortune as a singer. He was, of course, a fanatic, and capable no doubt—if he thought it for the good of his cause—of committing any deed of blood. I met him for the first time in the San Juan mountains in 1880. We became friends, and after a time partners, and spent the summer prospecting near Ouray.

Weary one day from climbing over boulders 8,000 ft. above the sea, we spread down our blankets in the hollow of a rock for a mid-day rest.

"Do you know, Mr. Yorris, how they catch rabbits in Siberia?" asked Romanoff.

I was watching a mountain sheep standing on the summit of a crag a long way off, but boldly outlined against the sky, and answered, carelessly, "As elsewhere, I suppose."

"There you are wrong," said the Russian. "Let us light our pipes and I will tell you.

"Rabbits are very numerous in the wilds of Siberia, and as you know, the winters are long and terribly cold. We select a locality where we know they are abundant and; a night when the Frost giants are abroad on the Steppes. Along the frozen streams and sheltered valleys we place a number of lighted lamps. The rabbits, poor things, freezing out in the darkness see the welcome lights, and soon approach near enough to feel the genial warmth. They collect around the lamps in immense numbers, and tears come into their innocent, beautiful eyes, and fall down as frozen pearls on the snow. Higher and higher grow the crystal columns, and soon poor puss becomes a prisoner; bound by her own tears to the ice-fettered earth. I caught in this way in a single night 92,003 rabbits."

I glanced fiercely at Romanoff; there was a merry twinkle in his eyes, but not the shadow of a smile. "Now, by the iron rule of Peter the Great, and the beard of Ivan the Terrible!" I exclaimed in simulated passion reaching for my Winchester, "I'll"—

"No you won't," said the Russian, curtly, as he coolly placed the muzzle of his navy six against my temple, a strange glitter in his dark eyes that I had never seen before, "No man ever gets the drop on me."

A WOODCHUCK GUN.

AN inquiry for a woodchuck dog in your issue of March 24 leads me to write of a woodchuck gun or rather rifle. Last spring I had some tree planting to do in a large cemetery in a rough, hilly, but beautiful place. The President of the Cemetery Association told me that woodchucks were greatly injuring the beauty of their place by their numerous burrows, and asked me if I knew of any plan to rid the grounds of them. I told him that I could dispose of a good many of them by shooting them. He said that this would not do, as they did not allow guns in the inclosure, as their report would frighten visitors (it was quite a public resort), especially the ladies. I at once showed him that my rifle, a 30 inch, 22 calibre Ballard, made but very little report with a 22 short cartridge. He thought it might do to hunt grasshoppers with if I could hit them, but that an old woodchuck would laugh at such a gun. I showed him that it would shoot through three inches of pine, and then he told me to go ahead.

Well, I am not a very great "slouch" with the rifle, but I cannot shoot a grey squirrel's head off every time one hundred paces as I heard once a fellow say that his brother could do, but I shoot as well as any of the boys I have struck yet at short range. I went a woodchuck hunting in the cemetery. I first looked over the ground, and found numerous holes or borrows only a small portion of which were occupied at the time, and made careful observations so as to distinguish the used from the unused holes, and soon learned to tell an occupied from an unoccupied burrow, carefully watching, and soon as Mr. Woodchuck protruded his cranium from his burrow I flipped one of the little leaden pills into it, or missed it as the case might be. Yes; I missed sometimes, for a woodchuck's head is a pretty small mark for me 50 to 100 yards away against a bank of clay of almost exactly the same color. And right here is where the joke comes in: the rifle made so little noise and so unlike the ordinary gun that the woodchucks would pay no attention to it, but they would run into their holes from the stroke of the ball near them and would generally come right out again to see what the rumpus was and give me a fairer shot.

The result of my rifle practice was, that I killed fourteen "chucks" by this still hunting about three hours in each of two days, and four more, making nineteen during the week, while going to lunch at noon. I found the best time to get shots in the spring time, just as the buds were swelling, was between ten and three o'clock of bright warm days. When shot directly through the brain they bounded right out of their burrows, but if hit in the body they could work themselves back into their burrows and die, and this appears to be the most desirable way to get rid of them, for I have a theory that the woodchuck, being found dead in his hole in this way by his neighbors, strikes the survivors with mortal terror and they emigrate. At least the survivors all left this cemetery, for I am sure I did not kill the half or the third of them, and I could see no signs of any there a month after.

While "working" these woodchucks I made one of those wonderful shots we so often read about. Looking across a ravine one day I saw a very large woodchuck coming over the brow of the opposite bluff, full 200 yards away, run a little way down the bank, stop and sit down on his tail, bolt upright his full length, as they often do. I drew a fine bead on a leaf about four feet directly above his head, and let go. I heard the little bullet whack on his "noggin" plainly, and the "chuck" went tumbling heels over head to the foot of the bluff, fully 150 feet, and then gathered himself up and, running like a wild turkey directly up the bluff to within a few feet of where he was when I shot, bounced into his burrow. They can stand nearly as much killing as a cat. I shot one "old rooster" directly through the head, where the brain ought to be, half an inch behind the left eye, the ball coming out at the base of the right ear; he bounced out of his burrow, cavorted around awhile and quietly died. I picked him up, admired the beautiful shot I had made, threw him down, and went on with my lunch. Pretty soon he gave a sneeze, jumped up and started off quite comfortably. I then gave him a roping shot in the left flank, and out at the point of the right shoulder as he ran quartering from me. He lay down and died again. In about five minutes he began making rather too much of a racket—I was watching for another across a ravine—and I shot him again right down through the centre of his head, the ball coming out at his throat. In about ten minutes I got the fellow across the ravine. He was a bad one; he would just raise his head from the burrow far enough to see me with the corner of his eye, and I could not see his head against the clay, but I would see a movement every time I would stir; so I drew a bead and held it until I thought his head was there and pulled, and out he bounced. I then picked up the old fellow I had killed so often, put him in my basket to show how big he was, and twenty minutes at least after I had killed him last found him breathing as regularly as a healthy babe.

And now a few concluding words about the modern .22 cal. rifle. I have used and carried them of different makers, actions and lengths, almost continuously for the past five years, and have found them all to shoot first-rate and to be big enough for any game we find in our older settled States; grand for ruffed grouse, squirrels, rabbits, hawks, cats, etc. I have killed a great many ducks with them, and killed them out of large masses 300 to 400 yards away. I have found their trajectory for the first 200 yards to be about the same as that of a .38 cal. rifle with the ".38 long" rim fire cartridge. I have used all lengths of barrel from 12 inches up to 30 inches, but found I could not hold a short gun. I therefore got a 30 inch Ballard, weighing 9 lbs., same as my shotgun. This is the gun for comfort and pleasure. It makes but little report when fired, not near so much as the old-fashioned percussion cap. It cost but little to shoot it—twenty-five cents per 100 shots; is no trouble to load. One can car-

ry enough cartridges in his vest pocket for a day's shooting, and don't scare the game out of the country when he shoots it. I have several different times killed both of a pair of mallard ducks in the water up the wind at 100 to 150 yards away, missing them of course several times. I have killed single ducks often 200 to 300 yards away after shooting at them sometimes a great many times, the splash of the balls would startle them a little, the crack of the gun not at all. I have killed seven quails out of a flock when feeding on a sward. I have shot at a ruffed grouse, killing him with the fourth shot, when drumming. Several times I have had shots at large hawks at long range before hitting them. Therefore it is a good rifle for "meat" and amusement, a grand thing to shoot fish with. Its killing power is truly wonderful. I have killed at long range many large blue and white herons, large hawks, turkey-buzzards, raccoons, etc., and generally they quit and lay right down when hit. It is a lovely Sunday gun when you are out of meat and don't wish to disturb your neighbors. Byrne.

Lacon, Illinois.

NOTES FROM NEVERSINK.

Neversink Lodge, Orange County, N. Y., April 6.

A FOX TERRIER, a bull dog or any fighting dog will do very well to kill woodchucks, but before you do that you must bring them to bay; for this purpose only small dachshunds will do. I have drawn many a woodchuck with them. It requires, however, a good deal of hard labor to assist the dog to dig after "chucks." Here is the *modus operandi*, run your game in first, then put your dashchund in, and if he strikes the woodchuck he will give tongue at once. Then dig down to the spot where the dog barks and you will likely strike both dog and game, and can enjoy the "kill." A good strong woodchuck will make an excellent fight. If, however, your soil is sandy, the ground hog will dig away faster than you can dig after him, and to circumvent him, dig a circle all around where you hear the dachshund give tongue, and you are sure of heading the 'chuck off. This is what I call the sporting way to exterminate them; a surer way is by trapping, of course, or by poisoned corn. I shall try ferrets, but doubt if they will bolt from one. Have dug only one out this season and my "bull" "chawed" him at once.

I see you write about cockers being good ratters. I had quite an exciting sport here under a corn stack. A large colony of rats was discovered and two cockers were brought into the fight. They killed sixty-five rats with great rapidity and enjoyed the sport immensely. Do all cockers make ratters?

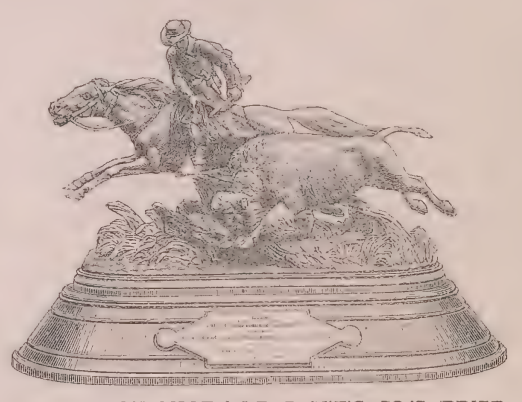
Your reports from Jersey about quail are terrible. My quail are all dead; on neighboring farms I hear none are left, and I had mine fed regularly. Rabbits stood the winter well, partridges also. Ducks are more plenty this spring than ever I saw them here; we have killed a good many black and wood duck, saying nothing of shelldrake. Woodcock have come in plenty. Snipe have disappeared again with the cold. I fear we have no quail left East to amount to anything. Jack went out trouting on the home farm and took seven beauties in ten minutes, all ¾ pounders—Palmer fly. Now, mind, although strictly preserved, they are wild and not fed or stocked trout, but real wild ones, and how they fight!

My decoy shooting for hawks and crows is a tremendous success. I advise all sportsmen to occupy their spare time to kill the "varmint." Here is my receipt: Build a well-covered blind, within thirty yards put out a live owl—a big one or a stuffed one—have it set up on a three-foot cross stick, and all passing hawks and crows will appear at once to fight the owl; then give them No. 4 shot, and the sport and success will amply pay you for the cold feet. It is difficult shooting, but rare fun. Anybody who wants full details can write me and I'll send all with pleasure.

Can't the sporting associations of the State get a law passed in the Legislature to exempt regular kennels from taxation. My taxes for dogs this year are put at $74.50—an enormous charge. I have the assessor and collectors tied up with an injunction at present, but fear they will beat me any how. I think some united action ought to be taken at Albany to get a new law exempting regular breeders. Cronyetis.

MASSACHUSETTS GAME.

BOTH partridge (ruffed grouse) and quail were quite plenty for this vicinity last fall, and I undertook to save what were left after January 1, by feeding all I could, and many a hard tramp did I have, with a large game bag filled with wheat screenings hanging from my shoulders and a paper bag of the same in one hand and a stout cane in the other, with the snow fully three feet deep on a level. But as the snow grew even deeper and cold weather had got into the superlative degree, I found that my feathered family was too large, or too wide spread for my strength, and one covey after another were very reluctantly dropped off to shorten my route and lighten my load, until Vernon's worst storm came and with its terrible drifts blockaded everything far and near. Yet I was determined to find the birds, and as soon as the snow had stopped blowing and drifting, notwithstanding the drifts, I started with some wheat, but was so completely used up upon reaching the nearest feeding-place that my courage to go further failed me, and after leaving a good supply of feed and resting a while, I returned home in my old tracks, feeling very sorry to leave the other birds to "perish," but fully determined that this one brood should not die for want of food. And they did not, for I fed them until the ground was quite bare, and then concluded to let them shift for themselves.



During the whole winter I improved almost every opportunity to inquire of our farmers if they had "seen any quail recently?" The answer was usually in the affirmative, and as the winter progressed and favorable reports continued to come in I commenced to doubt the possibility of freezing or starving *Masswchusetts* quail so easily as your numerous correspondents have conveyed the idea, and, with all due respect for their opinions, I must say that I believe there is a delusion about our quail and ruffed grouse perishing to such an extent as from 50 to 100 per cent. by cold or starvation during the past winter. In the first place I should like to know how your informants possessed themselves of such information as to enable them to state that "sixty per cent. of the birds had perished." They must have some rule in percentage not known to me at least. For if I go out once and see twenty birds, and the next time I go out do not see but eight birds I think it would be folly to infer that sixty per cent. had perished. I have watched the birds closely for the past few winters, and particularly so the last one. Have gathered all the information possible from wood choppers, farmers and old resident sportsmen, and I have not yet found among any of them a single one who ever knew either quail or partridge to perish from cold or hunger, or ever found their remains in the spring when they could not account for the death from some other cause than cold or hunger, the worst being a deep snow followed by rain and a sudden freeze, forming a stout crust shutting in the quail which roost on the ground and, huddled together, allow the snow to cover them. The partridges will dive into the snow presumably to keep themselves warm, and even when imprisoned under the snow by this icy sheet either of these birds will very often escape by the aid of a little warm sun to soften the crust over them. So much for the birds perishing from the cold. Now let's see about the starvation. Our partridge (ruffed grouse) live in winter in the thickest forests where the ground is usually completely covered with snow all through the winter and often far into spring, making it impossible for them to get anything to eat on the ground. Yet does he perish? No, indeed! as any one can easily find out by going into the woods late in the day where birches, maples or apple trees are near a thick pine growth, and there you'll see this poor (?) bird flitting about in the tops of the young trees making a meal off the tender birds at the ends of the small limbs as lordly as you ever have seen him strutting about on the green sward, and always "plump as a partridge;" and I believe they will live where the crow will starve to death—and who has known 100 per cent. of the crows to perished?

About the quail I cannot say so much. Have never seen them eating buds, in fact, have never seen one in a tree at all. Have heard of such a thing, but as I am trying to prove that hearsay is not always reliable I will pass that by and state what I know to be a fact, viz.: that several coveys of quail managed "by hook or by crook" to keep alive through all the cold weather and deep snows of the past winter, and keep in good running order until the coldest weather had passed and the ground was half bared, and then "O! where were they?" Not one sight or sign can I get, or even hear of them, not even the ones that were fed. Have 100 per cent. perished after outliving all the cold and snow?

I did almost fear that such was the case, and so made a very long tramp through places where they were last seen, and although I found the remains of several crows that had perished from No. 8 shot last fall, I could not find anything of the quails, dead or alive. Some of your correspondents speak of "missing their note," and so infer that 100 per cent. have perished. Do quail ever have any note at this season of the year? and do they not always disappear about the time the snow does, and do we hear the welcome Bob White until May, almost June in Massachusetts? As to partridge freezing, it should be enough to say, that if they can stand the cold of the winter just past—as I know they have about here—I think they will not freeze very soon; and I think if we are fortunate enough to live until October 15 we shall see some quail. If our city sportsmen will send us a few quail in the spring, now and then, from the South or West, I think we could furnish them with better shooting.

There are game clubs all about here, but the only signs of them we get here are dogs and guns, in season and out. Last season I had an abridgment of our game law printed and posted up where they would be seen in the pastures and fields, with the words, "All parties are warned not to violate this law on these grounds," printed in full-face type at the bottom, and it had a splendid effect, and I think it would be a good idea to have a large quantity of some such posters printed and sent out all over the country to be posted up in the game districts, as well as in post-offices and at railroad stations, etc. Who will join with me and help do it?

North Andover, Mass. G. W. Edwards.

THE LE ROY SHOT & LEAD M'F'G CO.'S PRIZE.

Presented to the New York State Sportsmen's Association, Meeting at Coney Island, June, 1881.

SUICIDES VS. ACCIDENTS.

THERE appeared a paragraph in a recent issue of the Chicago *Inter-Ocean* in which it was stated that an army officer in New York advanced the somewhat plausible theory that the late General Upton's sad death at San Francisco may not have been suicide, but accident. It was alleged that the General's habit was to sleep with a loaded revolver near at hand; hence the theory that, in a dream, he may have seized his revolver in self-defence and killed himself. His fellow-soldier, naturally seeking to put the most charitable construction possible upon the particular manner of his death, is made to say: "A sleepy grasping of the murderous weapon, and doing something as the phantasmagoria of his brain was doing, a crash and a silence, and the brave heart of a man who never spared himself in duty, who never failed at any hazard to live up to his creed, was stilled in death and the world, in its wisdom of making all deeds square with given rules, gives a verdict of 'suicide' when no idea of self-slaughter ever entered the mind of the victim. I write this in the sincere conviction of its truth. Upton was too brave, too conscientious, too noble to make a coward's path out of any difficulty, and no one who knew him will believe that any distress, any apprehension could have made him seek refuge in aught but work, duty and honor."

Now I applaud that sentiment with all my heart, as all must do who knew the brave and accomplished General, whom to know was to love. I have no personal motive in defending him against the dishonoring verdict of willful self-destruction. This is not my purpose in these lines. My object is to show by two or three out of a score of incidents, of which I have positive knowledge, and for the truth of which I am prepared to vouch, how easy it is for public opinion to err in adjudging a perfectly innocent man guilty of suicide, and consigning him to the grave beneath the shadow of a great crime. In supposed suicide, as in murder, judgment should be suspended till all the facts in the case shall have been obtained, then upon the facts construst your theories, form your judgment and found your verdict', giving to the accused every reasonable doubt.

I remember well what a pall fell upon our college at New Brunswick, N. J., when one of the students came to his death by a bullet crashing through his brains from a revolver that he was toying with one day after dinner as he sat upon his bed. He fell back upon his pillow and soon died. Had he been alone how plausible would have been the theory of suicide, and how the papers of that staid old city, ever on the alert for the next sensation, would have picked it up and published it abroad to the dishonor and disgrace of the poor, unfortunate lad. But as it happened, his chum was present and saw the accident, which circumstance put to rest the theory of suicide.

It was General Upton's habit to sleep with his revolver within reach. Is it not reasonable to suppose that he might have taken it up in a casual, careless sort of way, and perhaps cocked it, and while looking it over with the muzzle toward his face, it accidentally discharged. A case of personal reminiscence to the point. One morning last August I arose at half-past four o'clock, slipped my little "Smith & Wesson" into my pistol pocket, took my bass rod and spoon and struck out for a point in the river just below the village, for the purpose of taking a few bass before breakfast. I was alone, not another soul was astir. I was fishing near a stone quarry, the refuse from which was cast down the river bank. On the slope of this bank of earth and stone-chippings I saw a slender, slick little animal, very agile in his movements from place to place, which I concluded was a weasel, though I could not tell positively, for I was quite a distance away. Taking my revolver from my pocket I fired at him several times in quick succession without effect; then I cocked again for a final display of my poor marksmanship, when it suddenly occured to me that possibly I had emptied all the chambers, and as suddenly, and very carelessly, with my revolver cocked, and my finger upon the trigger, I twisted my wrist so as to bring the revolver up into a position where I might be able to look into the chambers, which of course would naturally increase the finger's pressure upon the trigger and also place the muzzle of the barrel near the eyes. To cap the climax of my folly, finding the exposed chambers to be empty, with the revolver in the position which I have described, my first impulse was to pull the trigger, when it flashed in my mind as quick as a wink that perhaps the chamber covered by the barrel contained a cartridge, and sure enough, aiming at the weasel, I pulled the trigger and off she went. All this happened in much less time than it has taken me to tell it. You can readily understand how it could not have consumed more than five seconds at the utmost. It was simply the mind and hand and eye acting instantaneously and almost simultaneously. A thought of the mind, a turn of the hand, a glance of the eye and it was done. It was that second evil thought to which my finger on the trigger was about to respond, which came very near ending my days there alone upon the river's brink. Upon reaching home I related the circumstance to my wife; and remarked that if I had been found there dead with a bullet through my head by my own pistol, it would have been reported near and far as a case of genuine suicide, and it would have required the judgment day to undeceive the world. Where the case is involved in mystery it is better to err in the formation of our judgments, on the side of mercy, and where there is room for the construction of a theory, of sufficient plausibility to exonorate a fellow man from the guilt of so heinous a crime as self-murder, to adopt it in charity. Hix.

Muskets, Darkies and Game.—Augusta, Ga., April 7.—I beg leave to intrude on your columns to the extent of a difference of opinion with your correspondent, "Pedagogue," who, no doubt, can do better work elsewhere. And really I don't think the game's in much danger from him personally. But what I particularly object to is his license proposition.

I do not know what locality he may be in from the article of March 23d. But I wish to say that we down here in Georgia want no license law, and we want a strict enforcement of the present game laws of our State. Game is getting scarce where it was once plenty, because every vagabond negro that can get a three-dollar gun and the pot-hunting crackers are killing everything that flies.

It is useless to put up your notice of "Trespass." No attention is paid to it, and coveys on your own grounds are often trapped or driven away by the constant raids by old army muskets altered into shot guns.

If the gentleman will come down to see us in the hunting season we will do our best to amuse him. Old Sport.

In your issue of November 25, 1880, in speaking of the Arnold House, "Nessmuk" says: "Here it was that Joseph Herreshoff, after losing a princely fortune in the vain attempt to make a fortune out of the plentiful iron ore hereabout, shot himself in despair." Now the gentleman's name was Charles Frederick Herreshoff, a son-in-law of John Brown. He was a Prussian by birth and was buried in Boonville.—W. S. L.

THE SILVER LAKE STANDS AGAIN.

ONE of the prettiest little sheets of water to be found in this section is Silver Lake, or, as it was originally called, Jones River Pond. It is situated in Plymouth Co., Mass., and has been the scene of several rowing matches. A large pine grove has been cleared up on the west side of the pond by the Old Colony Railroad Company, whose road runs in close proximity to the lake and, with its picnics and boating, has proved a popular resort. Its waters are extremely deep, in some places measuring over sixty feet, and is probably fed by springs, as the flow of water from the lake is more than can possibly run into it. Its length is about three miles, while its width varies from one-half to three-fourths of a mile. Owing to its size and depth it never freezes until late and forms a resting and watering place for geese, ducks and other small water fowl. At various places, generally points, individuals have erected small houses or shanties, which in the fall are dressed over and maked with pine boughs.

It requires some capital to run one of these stands. In the first place a set of wooden decoys for geese and one for ducks are procured, those for geese being three times as large as a common gonse. These are anchored near the centre of the pond and are for the purpose of attracting the notice of any passing flock.

It takes from one to two hundred of these to make any kind of a show, and then the stand has to be supplied with live geese decoys, of which it takes from ten to fifteen to do any business. These last, if well trained, command good prices. Then about the stand there must be twenty or thirty live decoy ducks and one or two boats. But let us see them light a flock and get them within gunshot.

It is a bright day in autumn, and as we sit listening to the musical honk of the old gander fastened on the beach, the lookout announces a flock in sight. Quickly, but silently, everything is put in readiness for their reception. The bush-covered shutters on the house are drawn up, while upon a little knoll a man sits concealed, ready to throw the fly geese, which are taught to fly out, circle around and finally alight in the water. If not trained decoys, young ones are used, as they will return. As fast as these are thrown the geese decoys on the beach and in the pens set up a loud honking and, if managed rightly, seldom fail to induce the flock to alight. The wild geese generally alight some distance from shore and when the birds are wild it takes an old hand to draw them near enough to shoot. To do this the geese decoys are pushed out on the beach in front of the stand, while an occasional fly goose is tossed over. Those in the pens are separated and all the display of decoys, together with honking, is made that can be invented.

Where there is only one stand this works all right, but when two or more stands are all trying to draw one flock the strongest team and most skillful handler takes the cake. The geese near enough, each man takes his place and fires at the word given by the one in command—first a volley; afterward as you can get it in on the wing or shooting over the cripples, for, be it known, a crippled goose in the water is a hard bird to capture.

It seems unsportsmanlike to murder these unsuspecting creatures while swimming boldly in your very face and eyes, but as it is the only way they can be captured here, and as there are plenty who like it, I don't know why it is not all right. As for me, the excitement of sitting around a stand day in and day out and not getting a shot is rather thin; and when you do get a flock it is all over in fifteen minutes; and it won't do to leave the stand, for if you do a chance may be missed. I call it, upon the whole, poor sport.

We were much entertained by a discussion in FOREST AND STREAM a while ago, referring to the "Silver Lake Horror," in which the writer was fearful the geese would all be slaughtered. They need not be alarmed, for I have lived about here all my life, and all the geese killed at Silver Lake, or any other pond in this vicinity, will not seriously diminish the family of honkers. R.

AN OTTER TRAPPED.

THE extreme wariness so characteristic of this animal is too well known to the practical trapper to admit of even a passive mention, but suffice it to say they are very sensitive of the appearance of man, and will not frequent a place where he has left his scent. It is also a well-established fact that they will not partake of any bait the trapper may prepare for them, but, like the generality of the animal kingdom, have a curiosity that leads them sometimes into a very unfortunate situation.

A few mornings since as I was going the "graud rounds" on Bailey Lake, my trapping ground, I was agreeably surprised to meet with rather an uncommon occurrence. My canoe I was carelessly paddling down the outlet of the lake, visiting the traps along the shore. Floating down near a huge cypress tree, behind which a trap was set, I heard a rattling of the chain and splashing of water that convinced me that a fur-bearer—a coon, I thought—was a victim to my devices. Landing just above the tree I stepped ashore, and to my wonder and astonishment what should I see wriggling and fretting at the end of a mink trap chain—nothing more than a fine otter. It took but a moment to take in the situation. Seeing that the hold was more insecure than I liked, and under the extra excitement I was fearful he would disengage himself from his tenacious companion, so my rifle was soon brought to bear upon him. A crack, and there lay a prized treasure struggling his life out, with three toes of the right foot within the fervent clasp of a No. 1 Newhouse trap. After he was thoroughly dispatched and placed in the boat I then began to trace up the cause of the lucky capture. The torn leaves near the scene showed that the whole herd had been there, and had emerged from the water at the foot of the great cypress. The trap was at the base of the tree at the entrance of a V shaped pen, baited with a white bird's wing, and slightly submerged preparatory to taking a coon or mink. The otter having indulged sufficiently in the leaf-scratching pastime, probably took a retrospective view, resulting in the discovery of the white trap bait that so much excited his curiosity as to induce him to give it a closer inspection, and in so doing experienced the genuiness of the faithful little servant, the trap, which I esteem as a crowning effort of Uncle Sewell Newhouse as an inventor and builder of his famous trap. The uncomfortable predicament the probable leader of the herd got into gave the others such a fright that they did not pay their nocturnal visit to the lake as usual the following night. The pelt, after being hunter-handled proved to be an extraordinary skin, showing prime in quality and No. 1 in size, and can be easily classed with the usual more northern catch, so hard has been the winter.

West Point, Ark., Feb 7. B. D. CHILDRESS.

NOTES FROM DETROIT.

IN the actual active game-killing world hereabout there is nothing to record beyond the fact that ducks are catching it. The ice in the lakes and bays has surrendered, and I find on making my accustomed rounds that the Hon. Andrew Jackson, of Sault Ste. Marie, and R. S. Fay, of Boston, led by some well-known sportsmen of Detroit, among them the irrepressible, ubiquitous, enthusiastic and enormous-appetited Ed. Gillman, are gone down to Point Mouillee for a few days' fun. Nothing has been heard from them as yet, but, as I am going down myself to-morrow, I shall be able in my next to give all the readers of FOREST AND STREAM a photographic, or at least a graphic, account of the party's adventures. It is the first sally of the season and we are all anxiously watching and waiting for results.

The Lake St. Clair Fishing and Shooting Club, a history of which you published a few weeks ago, held its annual meeting a day or two ago and elected Wm. C. Colburn, President; E. K. Norton and B. F. Farrington, Vice-Presidents; Fred W. Hayes, Sec., and Wm. A. McGraw, Treasurer. It was also decided at that meeting to enlarge and otherwise improve the club buildings for use during the approaching season, the idea being to make them the most attractive places of the kind in the United States. The club's finances are in excellent shape and there is no reason why its property should not be made and kept in A 1 condition.

The North Channel Shooting Club also has buildings on the St. Clair Flats. It has just elected a new set of officers as follows: President, R. D. Robinson; Vice-President, L. P. Knight; Sec., Dr. J. Lathrop; Treas., W. A. Butler, Jr. Directors—Congressman Henry W. Lord, J. P. Donaldson, Geo. M. Savage, Julius Hess and Geo. H. Lathrop. There is some quirk about this club's title to the land on which its buildings stand. It seems that the Dickinsons, who occupied it for many years, never got from the Government a patent for it, although their right to such a patent is now conceded. The present representative of the family has informed the club that if they will add him to procure the patent for the land he will let them have the use of it for club purposes at a merely nominal price. They have commissioned Congressman Lord to bull-doze the Interior Department to that end.

GIRARD.

"FLIGHT OF RIFLE BALLS."

GANSEVOORT, April 4, 1881.

IF we take the *Ipse dixit* of "C" and "D. W. Cross" as conclusive evidence upon this topic, why the whole matter is decided.

But is it decided? I think the fun is scarcely begun. The only argument employed by these gentlemen which bears upon the issue raised by Mr. Van Dyke is embodied in the following quotation: "An ounce ball or any ball fired from a rifle placed say ten feet above and exactly parallel to a horizontal plane, and the same size and weight of ball dropped from the same height at the same instant the ball fired left the muzzle of the gun, both balls will strike the plane below at the same instant of time, or if he blow a ball through the gun ten to fifty feet and drop another at the same time, both will strike the ground together. Taking this for an undisputed fact, there could be no time for the ball fired to be 'driven on a level line' and strike the ground at the same time the dropped ball does."

Now I fail to see how Mr. Cross reaches the conclusion expressed in the concluding sentence of the above quotation. That two bullets, one fired from a rifle and the other dropped from the hand, under the conditions named, will strike the ground at the same time is "an undisputed fact."

It is plain that in such case both bullets start toward the centre of gravity from a state of rest at the same time, and so long as they meet with no resistance other than the atmosphere, will continue to approach it at the same rate of speed.

It is also perfectly plain that as both start from a state of rest, if there is inertia to be overcome in one, there is the same amount of inertia to be overcome in the other. Admitting that there is inertia to be overcome by gravity before the bullets will commence to move toward the centre of gravity, it is perfectly plain that the bullet from the gun will move forward in a straight line until such inertia is overcome, when they will both begin to move toward the centre of gravity, one in a vertical line, the other in an eccentric curve. We now come to the "pint."

Does matter oppose inertia to the force of gravity at the instant the force that maintains such matter in a state of rest is removed?

Some may say that this is "splitting" very fine "hair." When it is remembered that the bullet may have an initial velocity of 3,000 feet per second, of course no means at right angles to the direction in which gravity acts, that it has no initial velocity toward the centre of gravity. I think it will be conceded that the philosophy that demonstrates the truth or fallacy of Mr. Van Dyke's assertion must necessarily be of a "hair splitting" sort.

I have been at considerable pains to decide the question for myself, and must say my experiments thus far tend to prove the fact that the bullet is "driven on a level line" for a short distance beyond the muzzle of the rifle.

What has become of Major Merrill? I for one would like to hear more from him upon this question. If he is now experimenting with the view of favoring the readers of the FOREST AND STREAM with another carefully prepared article on the subject we can afford to wait.

Mr. T. S. Van Dyke is evidently the possessor of a remarkably "level head" upon the science of gunnery. The issue upon which he now invites discussion is one which has never been clearly settled, either in theory or practice, that I am aware of. Let the "fun" go on. JOS. W. SHERTER.

AN OHIO DECISION.—The following case is reported in the Cincinnati, O., *Times-Star* of March 25:

On the 12th of last month H. J. Cain, the game dealer on Fifth street, near Vine, was cited to appear before the police court to answer a charge for exposing for sale birds, to wit: two quail which had been killed on a certain day between the 1st day of January, 1881, and the 17th day of February, 1881, contrary to the form of the statute in such case made and provided, and against the peace and dignity of the State of Ohio.

Mr. T. A. Logan appeared as attorney for Mr. Cain and made the point that the quail had been killed in the State of Illinois, and that the laws of Ohio did not apply to quail killed outside of the State. Judge Wilson heard the arguments *pro.* and *con.* about a week ago and this morning gave his decision in the case as follows:

State vs. H. J. Cain. The defendant is charged with exposing to sale on February 17, 1881, quail which had been killed during the time when the killing thereof is made penal. He does not deny the quail were exposed for sale, but sets up as a defense that they were killed in Illinois. Section 6,964, Revised Statutes, makes it unlawful to expose to sale quail killed during the time when the killing thereof is made penal. Are quail killed in Illinois quail "killed during the time when the killing thereof is made penal" within the meaning of the section?

Section 6,961, Revised Statutes, makes it unlawful for any person to kill any quail between January 1 and November 1. The section is limited in its operation to the State of Ohio; the prohibition as to time, which it contains, applies only to the State of Ohio, consequently quail killed outside of the State are not, in a legal sense, killed during the time when the killing thereof is made penal in Ohio. That such is the legal meaning of the words, "killed during the time when the killing thereof is made penal," is further evident from the fact that by Section 6,964 the exposure for sale during the prohibited season is made prima facie evidence that the quail were unlawfully killed within the State. The defendant will be acquitted.

A similar decision was rendered by Judge Force in case No. 30,967, Common Pleas. The cases cited (Whitehead vs. Smithers, 2. Common Pleas Division [British L. R.] 533, Phelps vs. Racey, 60, No. 3, 10, Magner vs. People, Supreme Court of Illinois, February, 1881,) are based on statutes which made the exposing for sale of quail during the prohibited season an offense irrespective of the time or place of killing.

THE NEW JERSEY LAW.—The following bill, entitled: "Senate, No. 193," introduced March 1, 1881, by Mr. Taylor, has been passed by the New Jersey Legislature. It explains itself, and we regret to see permits summer shooting the woodcock. We scarcely expected that New Jersey would fall back from the advanced position she had taken among the States that wished to protect game. The text of the bill is as follows:

An Act to amend and to partially consolidate the game laws of this State.

1—*Be it enacted* by the Senate and General Assembly of the State of New Jersey, That from and after the passage of this act no person shall kill, take, expose for sale or have unlawfully in his or her possession after the same has been killed, any woodcock, except only between the last day of June and the first day of August, and between the last day of September and the sixteenth day of December in any year, under a penalty of fifteen dollars for each bird killed, taken, exposed for sale or had in possession contrary to the provisions of this section.

2—*And be it enacted*, That no person shall kill, take, expose for sale or have unlawfully in his or her possession after the same has been killed, any hare (commonly called rabbit), ruffed grouse (commonly called pheasant), or quail (sometimes called Virginia partridge) except only between the last day of October and the last day of December in any year, under a penalty of fifteen dollars for each rabbit, grouse or quail killed, taken, exposed for sale or had in possession contrary to the provisions of this section.

3—*And be it enacted*, That the penalties imposed by this act may be sued for and recovered with costs of suit, in an action of debt, by any person before any judge of any city district court in or justice of the peace of the county wherein such offence shall have been committed, or in any county wherein such offender may reside or be apprehended; two-thirds of such penalty money shall be for the benefit of the person prosecuting the same, and the remaining one-third shall be paid to the collector of the township wherein the offence shall have been committed, for the township; and in case the defendant in any suit shall neglect or refuse to pay the amount recovered against him or her, it shall be lawful for the judge or justice before whom judgment has been obtained, to issue his process against the body of the defendant, and he shall cause him to be committed to the jail of the county in which the offence was committed until the judgment and costs are paid, the imprisonment, however, not to exceed sixty days from the date of such commitment.

4—*And be it enacted*, That all laws now existing relative to the preservation of game treated of in this act be, and the same are so far as the same are inconsistent with this act but no farther, hereby repealed.

5—*And be it enacted*, That this act shall be taken to be a public act and shall take effect immediately.

SNARED QUAIL IN NEW JERSEY.—Your correspondent recently had a long conversation with a prominent gentleman from Burlington County, N. J., relative to the preservation and protection of game in his county and learned from him that in each town along the coast—Tuckerton, Parkertown, Manahawkin, West Creek and Barnegat—there are parties who purchase from the farmer's boys all the quail snared or trapped by them, and that very many birds have been thus destroyed this season. He remarked to the writer that it would be a very simple matter for the West Jersey Game Protective Association to send to those parts coming under their jurisdiction one of their detectives who could in seas n always find snared quail in the possession of these dealers. There is a law against the snaring of quail in the five lower counties of New Jersey and these dealers know it. By making an example of one or two of the leading ones, my informant feels sure, will correct the evil. Let the West Jersey Game Protective Society begin at Tuckerton when the time comes.

The passage of the law two or three years since prohibiting fishing by seines in Tuckerton and Barnegat Bays in certain seasons of the year has had a marked effect. Almost any one can now enjoy line fishing and the summer watering season at Long Beach and Beach Haven have become famous to the angler.—HOMO.

QUAIL SHOOTING IN GEORGIA—Bainbridge, Ga., March 3.—Little do your sportsmen dream of the glorious fun to be had in this part of the country. Our county—Decatur—alone would furnish sport of this kind to hundreds of sportsmen yearly without diminishing the number of the birds. Last week myself and two companions left our law offices at eight o'clock, went five miles from town, commenced hunting at half-past nine, stopped an hour for dinner, ceased hunting at four and bagged seventy-five quail—killing every one of them on the wing. Pretty good for lawyers! During the same week, a few days subsequent to our hunt, three sportsmen bagged one hundred and eleven. The dogs used by both parties were untrained, and their conduct in the field unbecoming good hunters.

Ours is mostly an open, piny wood country. The birds range at large and do not confine themselves to fields, hence their great numbers. We have a pleasant town, a climate that is genial and healthy, and would be glad to welcome our Northern sporting friends, with their well-trained dogs and fine guns, to join us in our winter sports. Should they come we are confident they will repeat the visit. Besides quail, there are deer, turkeys, wild ducks and squirrels in abundance.—O. G. G.

HAY BAY GAME PROTECTION CLUB.—We are happy to be able to chronicle the formation of this club, as reported in the Belleville (Canada) *Daily Intelligencer:* "Some months ago we announced that steps were being taken to prevent the indiscriminate slaughter of ducks on Hay Bay, which from being the greatest resort of waterfowl in this region had of late years been almost deserted by the feathered tribes on account of the operations of pot hunters and so-called 'sportsmen' whose only object seemed to be to kill as many birds as possible. Some fifty persons, chiefly residents along the bay, together with a few sporting gentlemen of Napanee, petitioned the Ontario Government for a lease of the marshes

and flats from the eastern extremity to a road known as No. 1 road, which includes all the best shooting grounds. This lease has been granted, and the company will be organized within a short time The company intend to allow shooting on three days of the week only; they will enforce the necessary restricti ns to prevent poaching on their property, and will encourage game to resort thither by sowing a large quantity of wild rice, which though formerly abundant, had of late years become very scarce. Licenses will be granted to others than the members of the club. It is to be regretted that such action has become necessary, but the residents of the district have only resorted to this measure of self-protection as a last resort."

NEW YORK—West Sparta, March 26.—I wish to tell you of a queer marked squirrel I shot last fall. His back was red from his shoulders to his tail; his sides and tail were of the common gray color; his belly, legs, neck and head were black; its weight was thirty-three ounces.

The game of all kinds has wintered in good condition except quail, of which there are very few to be seen this spring. We hope the bill mentioned in your last issue in reference to giving a bounty on foxes, owls and hawks will become a law. They are very numerous in this section and not very wild. While away from home one day last December my wife heard a rumpus among the poultry, and upon going out to see what was the trouble she saw that a large hawk had caught one of the fowls and was doing his best to kill it. She tried to drive him off, going within a few feet of him, but he did not scare worth a cent. She then went to the house, took down my breech-loader, fitted a shell to it, went out and shot the "varmint," killing him instantly. The distance was a trifle over five rods, and it was the first time she ever fired a gun. With the revolver, however, she is quite an expert.—SPARTAN.

TAUNTON SPORTSMAN'S CLUB —The officers of the Taunton (Mass.) Sportsman's Club for the ensuing year are: President, James A. Woodward; Vice President, N. S. Williams; Secretary, R. W. Townsend; Treasurer, H. D. Atwood; Executive Committee, W. D. Tripp, C. E. Richmond, A. B. Hodges. The Executive Committee of the club concludes its annual report with the following bit of verse descriptive of rabbit shooting:

> When from the ancient peg whereon it hangs
> The old fusee some truant boy takes down,
> And slopes at once to scape parental frown,
> And seeks the nearest wood. Though loudly bangs
> The door he left ajar—a startling sound
> To those who dream within—he nothing heeds,
> But whistling gaily on his way proceeds,
> While slowly after limps the aged hound.
> But when he finds a scent that leads him on
> To heaps of brush, and pokes therein his nose,
> And out the rabbit scuds, the sight renews
> The strength of youth decrepitude is gone:
> He loudly roars, and swiftly then pursues,
> Until the gun the quarry's flight doth close.

CHENEVUS, April 3.—I was out upon three pieces of woodcock ground with my two dogs and put up more birds than at any one spring day in many years. The only theory I can give for such an occurrence is on a count of so much snow that the birds have to keep more together in the small places that are open for feelings.

I took an April fool trip by trying to catch a trout or a basket of them, with the snow banks three or more feet deep along the creek and the atmosphere so cold I could hardly hold my fall. Why does not the committee include skunks in their bill with hawks and foxes, etc.? They are as destructive to bird's nesting as any animal in this country.—D. C.

MOTTVILLE, N. Y —Foxes are unusually plenty here this spring, some fifteen having been killed in the past three months. I believe partridges would be plenty here if skunks and hawks could be exterminated. There were very few partridges killed here last fall. The cold weather began so early and was so severe that there was little pleasure in hunting them. Have seen them in goodly numbers while fox-hunting, and other hunters report seeing them daily now. I believe there is a general feeling of respect for the game laws in this vicinity, and consequently but few birds are killed out of season. Some pirates were robbing our lake (Skaneateles) of trout last fall. They did not reside in this vicinity. F. A. S.

APOLLO, Penn., April 4.—If we do live in the backwoods we have our setters and fox hounds of the finest strains and plenty of game. Pheasants, quail, woodcock, squirrels and rabbits were all plenty last fall, and the gunners were always seen coming home after a day's sport with a good lot of game. The winter has been very severe on the game. Farmers have told me of seeing rabbits frozen dead in their nests. Quail have fared better than the rabbits. I think there will be plenty. Readers of your paper will find a lively little village on Harry White's canal boat stream, and also Mr. Joseph Lewis and the subscriber with their fine stock of pointers and setters to pilot them.—G. STITT.

MASSACHUSETTS FISH AND GAME ASSOCIATION.—The annual meeting of the Fish and Game Protective Association was held at its rooms last week. The report of the Treasurer showed that $788.40 had been received during the past year, and $569.88 had been expended.

THE LONDON SOCIETY—London, Ont., April 5.—I inclose you two clippings from our local paper to show that London District Fish, Game and Insectivorous Birds Protective Society is still in existence and means business. In another ten days I hope to have our annual meeting, and trust that the secretary's report will be able to show that we have succeeded in our undertaking.—J. S. NIVEN.

CANADA.—St. Clair Fla's, April 1.—Mr. N. was at Big Point the other day. It is all frozen up except three open places. The holes are full of geese and ducks. He killed twenty-two redheads and two geese in two hours. The geese were hard hit and went to the St. Clair Lake, where the ice is still two feet thick. He followed them, but they flew again, and he thought the best plan was to leave them until morning, but when he went next day he found two eagles had secured them. There is good sleighing this morning.—W.

HAWK AND OWL ASSOCIATION.—The sportsmen of Washington county, Pa., have been so successful in their efforts to diminish the supply of hawks and owls in the county that they have organized a permanent society known as the Hawk and Owl Association, the object of which is to offer suitable rewards for the destruction of vermin. This is a most excellent movement and promises much practical good. The president of the society is Mr. Thomas McKeen, of Claysville; the treasurer, Mr. J. S. Margerum.

VAIL—Iowa, March 30.—I find from observation and inquiry that about sixty per cent. of the quail in this section have weathered the blast. Ruffed grouse are as thick as spatter and as fat as butter. They have had a regular picnic this winter as there is fully one half of the corn crop standing in the field yet, which has also helped to save our quail. Three beavers have been shot within a short distance of town this spring They were driven out of their quarters by the spring freshet.—E. B. B.

DUCK SHOOTING IN NEW YORK.—If any of your readers inquire for a good place for duck shooting near the city tell them to address Captain E. N. Danes, Sayville, Long Island. The captain is a jolly good fellow with lots of decoys and no end of willingness to oblige. His charges are the most reasonable of any that I have experienced in a considerable experience in shooting on the Long Island and New Jersey coasts.—R. T. M

MANCHESTER SHOOTING CLUB.—The Manchester Shooting Club, of Manchester, N. H., is in a flourishing condition, and is growing apace. The officers are: President, Benj. F. Clarke; Vice-President, George F. Elliot; Treasurer, Lewis K. Mead; Secretary, Arthur E. Clarke; Executive Committee, Moses Wadleigh, George E. Morrill, Horace Tobey.

THE TORONTO GUN CLUB IS one of the most active sportsmen's associations of Canada. We are in receipt of its constitution and by-laws, which show the club to be in possession of admirable rules. We bespeak for the Toronto Club a long lease of harmonious prosperity.

OHIO, Cleveland, April 2.—I was out last Monday and found a woodchuck's nest with four eggs, all spoiled. Now the snow is three feet deep over the eggs, the deepest snow of the season. No snipe could live here yet. J. C.

INFORMATION WANTED.—F. M P. wants to know the nearest locality to Chicago, Ill., where good squirrel shooting can be had.

We should be glad to learn where beaver tails for eating can be obtained in any quantity, either fresh or pickled. Will some of our trapper correspondents let us hear from them on this point.

NEW YORK.—Hornellsville, April 4.—Many grouse have been frozen or starved. The snow in the woods near this city is still four feet deep.—J. OTIS FELLOWS.

WILD PIGEONS.—We have received several inquiries regarding the whereabouts of wild pigeons, and we shall esteem it a favor if our correspondents will advise us on the subject.

PHOENIXVILLE, Pa., has a new game association which is to restock that vicinity with quail.

A good cartridge-belt is a desideratum in the sportsman's outfit. Such a belt is advertised elsewhere by the Winchester Repeating Arms Company. The Mills belt possesses some important advantages over all others, and intending purchasers of a belt should inquire into its merits.

$25 in Doctor's visits will do you less good than one bottle of Hop Bitters.

Sea and River Fishing.

There is the Fussy Angler, a great bore; of course you will shun him. The "Snob" Angler who speaks confidently on a slight capital of skill or experience. The Greedy, Pushing Angler, who rushes ahead and half fishes the water, leaving those who follow in doubt as to whether he has fished a pool or rift carefully, or slurred it over in his haste to reach some well-known place down the stream before his companions. The company of these, the quiet, careful angler will avoid.—THAD NORRIS.

BOOK OF THE BASS.—Dr. Henshall's book on the fresh water bass is about ready for the press as per advertisement in another column. This book has been long talked of and will no doubt meet with a large sale. Since the first announcement that such a book was in preparation we have received numerous inquiries concerning it, showing that much interest was taken in it by our readers.

THE GREEN RIVER TROUT PRESERVES.

At this season of the year New York trout fishermen naturally turn their steps toward Long Island, indeed the streams of Pennsylvania and other inland resorts are not inviting when there is more ice than clear water.

The *Graphic* gave the other day a list of names of gentlemen who are expected to open the trout season at Blooming Grove Park on the 15th inst., but that is too early for Pennsylvania. May 15th is about right there.

By invitation of E. R. Wilbur, Esq., a parti carree, Messrs. Austin, Giles, Avery and Wilbur, the latter a part owner of the Green River stream, noted for its salt water trout, reached the grounds on the evening of the fourth of April.

On the way down by the 4 P. M., train, (one hour and thirty-five minutes to Sayville,) they passed and inspected from the car windows, the Lorillard Place, South Side Club House grounds, and ponds, W. K. Vanderbilt's elegant country seat, a palatial mansion with ornamental grounds, Stellenwerf's trout ponds, etc., expecting to see crowds of members out in force whipping the streams and ponds, but only one solitary piscator was seen, hip deep in a stumpy pond, presumably taking liver-fed caricatures of the *Salmo fontinalis*.

At Sayville we were met by the spanking team of our host and whirled through the town entering the grounds by an ornamental gateway, the fence extending on both sides along the highway.

We pass a comfortable farm house which serves for the lodge, then past meadows and fields through an avenue of oaks, between whose trunks we catch glimpses of the blue South Bay, glistening with white caps under a stiff northwester, and draw up in front of a comfortable mans on with broad piazzas on all sides, and handsome stables in the rear, also graperies, ornamental shrubbery, cedar hedges and fruit trees, in fact a charming summer retreat for the overworked man of business,

Captain Brown who is in charge of the premises extends a hospitable hand and we are soon enjoying the grateful glow of a coal fire in the library before dinner is served.

During the evening, spent as becomes sportsmen, in fishing and hunting reminiscences, frequent observations are taken of the weather, with poor prospects for a good day on the morrow. The crescent moon shines with a steely light and a cold, keen, bitter wind manufactured to order by Vennor, in the far north-west, sweeps over the flat landscape with ominous howls and moanings.

The morning is but a continuation of last nights "blizzard," the temperature lower, and as we venture forth with rods, reels and creels, and approach the stream, we find the ditches in the meadow frozen hard, but the stream is open and we commence casting. With numb fingers "all thumbs" in marine parlance, it requires all one's patience to cast in the teeth of the wind. I am standing on a tussock in a bog, it shakes and I leap for another, alas I missit by an inch, and instead of landing on terra firma my right leg plumps to the knee in ooze and water, my boot is full of both. A bad beginning, I think, as on one leg, with the other raised horizontally, the water runs out of my rubber boot.

But "misery loves company" and for my consolation just then a gust carries Giles' black Derby like a wounded crow skimming over the pond a hundred yards away, where it slowly sinks. Soon Wilbur is seen pulling off from shore in a ducking skiff which he with difficulty guides with a long pole. He says he can get the hat, but he can't reach us against the wind; just then a puff comes, the boat gyrates, horror! she is over, no she rights with W. sitting safely on the bottom of the boat clutching a dripping hat.

Meanwhile one hatless and the other wet, we wend our way toward the house, both having had enough, we think, of fisherman's luck and trouting in April.

But what is this? We see Austin making tracks toward the house across the meadow where he has been industriously whipping the stream. He soon reappears with a new tip, he broke his on a "big one." Hope rises, we follow him back to the stream in the meadow.

"Try there," he says, "on this side in that deep hole under the bank where the current wears into the clay bank. Ah! I have him—a beauty of three-quarter pound—no white liver-fed idler, but a genuine wild sea trout just in from the Great South Bay, which is only a few hundred yards distant.

Soon Austin hooks another, and with the skill of an adept he guides the lively fellow along the bank, up and down, across and back again, the rod thrills under the strain, and I stand forgetful of my tackle to watch the result. At last he is landed and flopping among the reeds and grass just in time, though another spurt would have separated the bit of muscle on the upper jaw already torn by the hook. It is a beauty (speckled, of course), of about twelve ounces, and he takes his place with others in the creel.

The Green River we are fishing, rushes out over a sandy beach into the bay where lie many cat boats at anchor. Austin proposes that we cross the stream at the beach on a convenient timber, and fish up stream again which will bring the wind in our favor. As I linger behind the others Wilbur appears, having strolled out from the house, and with the experience of a veteran fisherman he points out a particular spot to cast, just below an old boat which lies diagonally across the stream. Hardly does the line straighten on the water when a big black fellow darts from under the boat never to return. After a hard tussle he is gasping on the shore and, after a smart blow on the head is transferred to the creel. This trout was caught within a stone's throw of salt water, and had probably run in from the bay quite recently. Another cast was rewarded by another fine fish from under the same boat.

Our success in fishing up stream did not warrant longer delay. It was also too cold for fishing with comfort. I took a one-pounder from a deep hole under a clay bank, and Austin had a strike, but failed to hook the fish, and we soon adjourned to the house *nem con* where, sheltered from the wind on the grass, we laid ten fine fish for the inspection of Capt. Brown.

The other gentlemen returned from a stroll among the oaks on the bay shore, and we drank a toast to the success of the Green River preserve.

I should not forget that our host in the true fishcultural spirit brought down twenty German carp of small size which he put into a pond, one of several new ponds which his men are excavating on the meadow.

After dinner with a menu somewhat fishcultural, including huitres salees de Blue Point and Haut Sauterne, we rolled comfortably to the station and took the 4 P M. train for the city, allowing a few favored friends a peep into our creels.

The delicacy of those salmon, pink salt water trout, when boiled, is not the least agreeable memory of this trip. J. A.

SALMON FISHING ON THE PENOBSCOT RIVER.

RECEIVING information that salmon were being taken on the East Branch of the Penobscot River, near Hunt's Farm, we organized a party, consisting of the writer, George B., and Howard L. Brown, Dr. E. Lewis Sturtivant, of Framingham, R L. Davis, Boston, and S. B. Gates, of Winn, Me., and were taken in charge by Alex. McCavin, of Mattewamkeag. Leaving Winn the 28th of June—some of us up river in canoes, the others *via* road connecting at Medway, twelve miles above, at junction of East and West Branch, from which place we started at 4 P. M. in seven canoes—we made our first camp on Fisk Farm, four miles above Medway. If any one follows our plan we would advise them to make camp at Second House, as it is much better located. Next morning, getting an early start, we soon arrived at Rocky Rips, where we caught a few small trout and our first salmon, about eight inches long, at the entrance of Meadow Brook, noted for good fishing early in the season. Passing over Rocky Rips without carry next we came to Grindstone Falls at noon, which we were obliged to carry three-quarters of a mile, over a very good path on the left side of river. (Below the main fall I raised a salmon on our return, opposite a large spring.) Our second camp was made near the head of the falls.

Next morning, breaking up camp at 7 o'clock and passing over smooth water two miles, our attention was called to Mud Brook, entering the river on our right, where trout are found and taken in May and June. Nearing Bear Rip we found another trout stream on the left side, from which Mr. George Brown took three dozen very quickly. Overtaking the party at Whetstone Falls in time for lunch at noon, here we relieved the canoe of baggage, enabling the guides to push over the falls, we making the carry on the right side, distance one-half mile. Again loading up we made the next two miles to Hunt's farm over smooth water. The farm is

located on the east side of the river, thirty-five miles by road from Winn, and about same distance by river. The clearing is in good grass land and is beautifully located. The western view is very fine, one of the best we had on the river—Hunt's mountain and extensions in the background. There is quite a pool near the house, formed by the waters coming together after being separated by an island, the heaviest water making a sharp turn, forming the pool, in which we were informed the salmon were continually leaping during the months of July and August Half a mile above is a splendid pool, at the junction of the Wassatiquirk stream, which enters from the west, rising in the vicinity of Mount Katahdin, fifteen miles distant, to which there is a passable road following the valley of this stream. This is the salmon stream of the vicinity, and salmon will be taken from it next season by the visiting fishermen, also good trouting at any proper season.

The pool at this junction was netted every evening this season, from the arrival of the salmon up to July 15, and it was reported that over 600 fish were taken from it, weighing from nine to twenty-eight pound each. Thirteen was the largest number netted any one night from this pool while we were in camp.

Mr. Davis, while carelessly drawing the fly along one evening, had a salmon rise to it, but missed, after which we whipped the pool an hour, without success; same evening the net took out seven, weighing 142 pounds. A few rods up the Wassatiquirk there is another nice pool and a good cast. Dr. Sturtivant found three salmon in it one morning and succeeded in raising them twice. The same evening, giving them another trial, they came for the fly, but missed. (I will say here that Dr. Sturtivant never yet had the pleasure of handling a salmon with rod and reel, but proposes to realize the feeling in the near future.)

Going up the river from this point we found smooth water three miles to Sabovis stream, said to be a salmon stream, but we did not examine it. One of our party reported seeing three salmon at the Junction, but did not give them any attention. Seven miles above the Hunt place we found a pond in the river and a nice pool for fish at the lower end. Above the pond is three or four miles of rapid water. After pushing over it we arrived at Cold Spring Brook, where we found exciting sport with trout, taking all we wanted in a very short time. There is a good camping place here; good, cool spring water near. We noticed only one salmon in the pool on our return. One mile above this we made camp at foot of Bowline Falls; found Hulling Machine Falls, which joins Bowline, about half a mile, with strong water between. At foot of Hulling Machine Falls found good trout-fishing and a good salmon pool at head of Bowline Falls.

Howard Brown and myself, with our guides, visited Grand Falls, which we were informed was the largest of any on this branch. We found it quite imposing—think about fifty feet fall—and a nice fishing point at proper stage of water. On our return from Grand Falls we broke up camp, arriving at Hunt's farm the same evening. Our party then decided to return to Winn next day and, starting at 7 A. M., we arrived at the Katahdin House at 5 P. M.

I can see but one reason why we did not succeed in taking salmon, which is this, that we met a rise in the water the second day out at Grindstone Falls, caused by opening of the gate of dam at Molunkus Lake, giving us the benefit of some thirty miles' surface water, for which we must wait until it run off and gets down to the natural stage.

Any party wishing to visit the East Branch and try for salmon can receive reliable information when the water is at proper level for fishing by writing to S. B. Gates, Winn, Me., who will procure guides and necessary camping articles also conveyance to the Hunt farm. To go by road leave Winn on arrival of morning train from Bangor, arrive at Hunt's place early in the evening, over a good road to Sherman, thence six miles not so good, but passable for light carriages or you can go over the same route by the daily stage to Hunt's, buy your ticket from Boston to Mattewamkeag, and check baggage to Winn, where you will find good accommodations at the Katahdin House.

We visited Gordon Falls on the Mattewamkeag River, three miles above the village, and found salmon leaping below the falls. The commissioners propose putting in a fishway the present season at this fall which will make another salmon stream for fishing. Since writing the above we received information that H. L. Leonard, of Bangor, took the first salmon this season with the fly near the Hunt place which would establish the fact of salmon taking the fly on East Branch; also, Mr. Gates informs me he has secured the possession of the Hunt clearing, and will put the buildings in repair comfortable for fishermen. C. H. B.

PENOBSCOT SALMON.—A statement that has been going the rounds of the newspapers in regard to taking salmon with a fly in Penobscot River requires some correction lest parties be misled thereby. It purports to be a quotation from the annual report of the Maine Fish Commissioners for 1880, but its meaning was misapplied. Reference was therein made to taking Penobscot salmon with a fly, it is true, but those salmon had first been caught in weirs and then placed in a pond near Bucksport, where they were confined for purposes of fish culture, and it was from this pond that the fish mentioned were taken with a fly and not from the river. Some six hundred or more salmon were in this small pond where they had been kept many weeks without food other than such insects as nature supplied.

The statement in regard to the number of salmon caught in 1879 and in 1880 in the Penobscot referred solely to fish caught by means of nets and by professional fishermen. So far as is known but a single salmon was taken with a fly in the Penobscot River last year, although several parties of rod fishermen visited the east branch and other portions of the river for the express purpose of fishing for salmon; but their time, money and patience were spent in vain, and they returned without a fish, although they had many bites—from flies and mosquitoes. There was a single exception among the many failures. Mr. H. L. Leonard, with a persistency worthy of greater success, made repeated trips to the upper waters of the Penobscot for the purpose of catching a salmon and did succeed in catching one fish. This fact was considered an event so unusual as to merit publication, and that solitary salmon was the only one recorded as taken with a fly. Nor does this river afford good trout fishing as compared to smaller streams, although some of its lesser tributaries abound with small trout; the river itself does not, owing, probably, to the warmth of the water, until one reaches the very uppermost sources.

He who seeks the Penobscot for good fishing—for salmon or for trout—is likely to reap as little reward as did the writer upon two trips made for that purpose. An occasional fish may be taken by an expenditure of time and means such as would afford some dozens elsewhere.—SAMADA.

NEW FISH LAW IN NEW JERSEY.—The following law, entitled An Act for the protection of fish, was recently passed by the Legislature of New Jersey:

1. Be it enacted by the Senate and General Assembly of the State of New Jersey, That it shall not be lawful to cast or draw any seine or net of a mesh of smaller size than four and one-half inches in the Delaware River above the foot of Trenton Falls, between the first day of April and the fifteenth day of June in each year; and it shall not be lawful to cast or draw any seine or net in said river above the foot of Trenton Falls between the fifteenth day of June and the first day of November in any year, excepting small mesh nets used for the purpose of catching bait, and known as minnow nets

2. And be it enacted, That it shall not be lawful to take at any time in any of the waters under the jurisdiction of this State, any black bass or Oswego bass, with any contrivance or device, excepting with hook and line, in the manner commonly known as angling or with scroll, spoon or artificial bait, in the manner usually known as trolling; nor shall it be lawful to place any set lines in the waters of this State inhabited by black bass, Oswego bass, landlocked salmon, salmon trout or brook trout.

3. And be it enacted, That it shall not be lawful for any person to take from any of the waters under the jurisdiction of this State any black bass, or Oswego bass, before the first day of July, nor after the first day of November in any year.

4. And be it enacted, That it shall not be lawful to place any fyke nets in any of the waters under the jurisdiction of this State before the fifteenth day of June, nor after the tenth day of August; and it shall not be lawful at any time to place fyke nets at the confluence of any wing-dams in any of the streams in this State.

5. And be it enacted, That it shall not be lawful for any person to place in any of the streams of this State, which are runways of migratory fish, shingles or other devices, to frighten the said fish, or deter them from ascending the said streams on their way to their spawning grounds

6. And be it enacted, That when any of the lakes, ponds or streams in this State have been stocked with game or food fishes by the Commissioners of Fisheries of this State at the public expense it shall be unlawful to take fish from any of the said waters for the term of three years from the date of such stocking.

7. And be it enacted, That the penalty for the violation of any of the provisions of this act shall be twenty-five dollars for each offence; and it shall be the duty of the fish wardens of the several counties of this State to cause the removal and destruction of any of the appliances herein forbidden, and the arrest and prosecution of any offenders against the provisions of this act.

8. And be it enacted, That nothing in this act shall be construed to prevent the Commissioners of fisheries of this State to take or to have taken under their direction fish from any of the waters of this State, at any time, for purposes connected with the performance of their duties.

9. And be it enacted, That all acts or parts of acts inconsistent with the provisions of this act are hereby abrogated and repealed; and this act shall take effect immediately.

BLACK BASS OUT OF WATER.—I have been reading up the stories of carp living out of water for twelve hours or more, and believe that the black bass will exist just as well when twelve hours out of the water. Yes, and I would be prepared to back him to do the same at the end of twenty-four hours, provided the bagging is kept wet. Now for my fish story. Last October I went to Linden, ten miles above here, to fish for black bass. The first caught was a two-pounder, hooked and landed by a nephew of mine, a boy fourteen years of age, and being his first fish he was rather proud of it. The boy and I fished all day, from 8½ A. M. till 6 P. M., the two-pounder being all this time the first fish on the string. We quit fishing at dark, jerked the string of fish over the side into the boat, rowed two miles to Linden, carried the string of fish to the hotel, left them on the porch over one hour, when they were tossed into the wagon and we drove home. The porter takes the string of fish—about ninety nice ones—shows them all around to the ladies and gentlemen and places them on a slab in a cool storeroom. About half-past nine some ladies, anxious to see the string, went to the store, and while they were examining and admiring, I slipped the boy's first catch off, and while I was explaining to them how neatly the boy made the first land, Mr. Bass flopped out of my hand on to the floor, and I picked him up and took to a fountain, where he lived till I had to dry up the outside water works. Seeing the whole affair I can vouch for it, and should you ever tell the story and an unbeliever say "Jonah!" and if he is a good fellow and the friend of all good fellows, just consign him to me next September and I will take pleasure in giving ocular demonstration.

Williamsport, Pa. MOD.

SALMON FISHING IN IRELAND.—The Shannon, Castleconnell, March 18.—The fishing season opened here on February 1, and up to the present has not been bad, in fact better than it has been for a few years past, considering that we never look forward to fishing with much chance of success before 20th of this month (March) after a succession of floods and rising water during February. The river is now settling down to good fishing order.

Mr. Henry Hodges' fishermen on the Doonass fishery Feb. 11, one salmon 13 lbs.; 16th one salmon, 20 lbs.; 22d, one salmon 32 lbs.; March 4, one salmon, 14 lbs.; Mr Henry Hodges, March 11 one salmon 17 lbs; Mr. I Muller's fishermen on the Newgarden Fishery, Feb. 12, one salmon, 16 lbs; 28th, one salmon, 12 lbs.; Mr J. Muller, March 16, one salmon. 13 lbs; 17th, one salmon, 17 lbs. The fishermen on the Prospect and Landscape Fishery, Feb. 28, one salmon, 11 lbs.; March 12, one salmon, 16 lbs.; Mr. I. E. H. Orr, Royal Artillery, on Mr. E. T. Ingham's preserves, March 15, one salmon, 21 lbs.; Captain Vansittart's fishermen on the Hermitage Fishery, Feb. 12, one salmon, 14 lbs; 16th one salmon, 16 lbs. Captain Vansittart, March 17, two salmon, 25 and 19 lbs. Mr. Richard Bourke Jr., on same fishery, Feb. 28, two salmon, 22 and 14 lbs. Colonel John Vandeleur on the Irinas Fishery, Feb. 26, one salmon, 33 lbs.

JOHN ENRIGHT & SON

A NEEDED LAW IN ARIZONA.—An Act to prevent the destruction of fish.

Be it enacted by the Legislative Assembly of the Territory of Arizona:

Section 1. From and after the passage of this act it shall be unlawful for any person to take, kill or destroy any fish in any river, creek, lake, pond, spring or stream of water in the territory by the means or use of giant powder or cartridges, or any explosive substance.

Sec. 2. Any person violating the provisions of this act shall be deemed guilty of a misdemeanor, and upon conviction thereof shall be punished by a fine of not more than $300, or by imprisonment in the County Jail not exceeding three months, or by both such fine and imprisonment.

Sec. 3. One-half of all fines collected under and by virtue of this act shall be paid to the informant or informants who shall have caused the arrest and conviction of the person or persons offending, the right of such claimant thereto appearing to the satisfaction of the Court, and the other half shall be paid into the County Treasury as the fines collected for misdemeanors.

Sec. 4. All acts or parts of acts in conflict with the provisions of this act are hereby repealed.

Sec. 5. This act shall take effect and be in force from and after its passage

Approved February 3, 1881.

(Signed) J. C. FREMONT,
Governor Territory of Arizona.

THE BLUE MOUNTAIN HOUSE—Moira, N. Y.—I have just had an opportunity to examine Stoddard's new map and guide book for the Adirondack region. The map is a very good one, and shows up the northwest portion of the wilderness or St. Regis Rivers district better than any map I have seen before, although he has given some of the ponds wrong names, or different ones from the ones they are known by here. His book makes no mention of the Blue Mountain House, but he mentions a house which he calls the Forest House, by C. A. Merrill. I never heard of a house by that name. I have known Mr. Merrill several years and that he lived in a small house near the Blue Mountain House, and also that he occasionally went with parties of sportsmen as guide and sometimes had one or two residents from other portions of the county. The Blue Mountain House, on the contrary, is a large two story building; Mr. Phelps, the proprietor, keeps a span of horses and a spring-seat wagon to carry his guests to the station, if they should wish it. He has several good boats on the level and others at ponds in the vicinity, two or three good hounds, and the best partridge dog I know of, also tents and camping outfit, etc. The table is as good as at any house where the charges are moderate.

I am in no way interested in the Blue Mountain House or its proprietor. I always camp out and take along my own provisions, tent, boat, etc., when I go to the woods. I only write this to explain why I have not mentioned a house for the accommodation of sportsmen in my letters to the FOREST AND STREAM, and also to numerous sportsmen in describing that locality. ALBERT CORNISH.

CANNED MEATS.—In your issue of March 31, under the heading "What Supplies Shall We Take With Us," you ask for the names of reliable dealers in canned goods. I was in the employ of Wm. Underwood & Co., of Boston, for five years and think their goods will be found reliable. The statement concerning the sheep and cattle is rather tough, but I can't say it surprises me much. I suppose there are few trades in which fraud can be more successfully practiced than in the canned goods trade. Nine times in ten the label sells the goods. Canning dried corn and peas which have first been soaked, and then selling them as "fresh" corn and peas is one of the most common frauds.

I mention the above concern simply because I have had some experience with them There are good and reliable concerns in most of the large cities, and canned goods can be bought which are all they are represented to be. In making a selection I would say use common sense and do not buy goods which are selling at prices below the cost of honest manufacture A few cents a can saved will ill repay one for the loss of a meal, especially when out of reach of stores. As a rule cheap goods are dear at any price. SIALIA.

RELIABLE CANNED GOODS.—New York, April 4, 1881.—*Editor Forest and Stream:* The canned meats, fruits and vegetables of Richardson & Robbins, the fruits and table delicacies of Gordon & Dilworth, and the Monticello brand of chow-chow, gerkins, etc., can always be depended on as being of the best quality.—T.

TENNESSEE—Nashville, April 4.—With the exception of snipe, our shooting season is over, until August, when doves become plentiful, the shooting of which is much liked by sportsmen about here. Snipe have been unusually scarce, owing, doubtless, to the bad weather. Messrs. Breyer and Legler were the most successful in their bags of the many who went out, yet they never got more than ten or twelve to each gun.

The "German Carp" imported to this State about two years ago, form the subject of conversation among our fishermen on account of their wonderful growth, and the fact of their spawning at the early age of one year. That there can be no doubt of the fact, a female, one year old, was taken from the pond at the asylum grounds, which contained a roe as large as a man's hand. The superintendent, Dr. Callender, is the authority for the above and the statement that there are thousands of carp fry in the same pond. John Burkholz, a native of Bavaria, Germany, living here, told me that in a carp pond on his father's farm the year old females spawned: from this the three-year old theory would ply only to very cold countries.—J. D. H.

WE HAVE RECEIVED a copy of the new illustrated catalogue for the season of 1881, published by Messrs. Conroy Bissett & Malleson, 65 Fulton street, N. Y. It contains, besides the price list, a great deal of valuable information to the angler and camper-out and is very fully illustrated. The directions for selecting tackle are so explicit that the beginner cannot make any mistake in ordering his goods, and the well-known reputation of this house, established since 1830, is sufficient guarantee that everthing sold will be of the best. This catalogue, arranged by Mr. W. Holberton, has been published at great expense, and is furnished at the nominal price of 15 cents, which amount will be returned to customer ordering tackle.

BASS FISHING IN MICHIGAN.—I fully agree with U. S. S. in regard to placing a minnow on the hook for bass. We fish here in Michigan almost always with the live minnow hooked as U. S. S. describes or hooked only through the under lip. The fishing for bass has been tried but little here, but there are many anglers myself among the number, who wish to test it thoroughly the coming season. Our bass are very gamy, and I see no reason why we cannot have fine sport with the fly.—A. P. S.

A POISONED TROUT STREAM.—Our correspondent, "J. M. B.," writing from Sullivan County, N. Y., says that an oil

pipe of six inches in diameter crosses the head waters of two of the principal trout streams in the town of Eldred in that county, and the pipe leaks and no doubt will poison the fish far below. The best trout fishing is five miles below the pipe at present, but it bids fair to be entirely destroyed.

THE FLY CASTING TOURNAMENT.—Wm. Mills & Son, fishing tackle dealers, 7 Warren street, N. Y. city, offer a Leonard "Catskill rod," which promises to be one of the lightest trout rods ever made. It will be gold mounted and of split bamboo. The same firm offers also one of their rubber click reels filled with their best enameled water proof silk line.

TROUT FISHERMAN.

Can learn of a rare opportunity for purchasing a small farm in a charmingly healthy and respectable locality within an hour of New York city, by rail, on which are several powerful, overflowing and never-failing or diminishing springs of delightful clear, cool water suitable for making a large pond, at very small expense, for propagating and angling of trout and other fish of like nature, by addressing "Angler," Box 28, Newark, N. J., Post Office. Excellent orchard, grazing and fine farm house on premises.

Fish Culture.

THE AMERICAN FISHCULTURAL ASSOCIATION.

THE tenth annual meeting convened pursuant to call at the Hall of the Fulton Market Fish Monger's Association on Wednesday, March 30, at 11 A. M., President Roosevelt in the chair. The minutes were read and approved. A letter of regret was read from Mr. Samuel Webber, Commissioner of New Hampshire. Mr. Blackford then read the following letter from Mr. Geo. Shepard Page, Vice-President of the Association, dated at London, England, March 14:

"As you are aware, there is to be a fishing exhibition at Norwich, England, Easter week, and Mr. Huxley will read a paper there on the herring family. In all his magnificent collection of fishes he has no shad. I have urged him to introduce them into the English, Scotch and Irish rivers. Indeed, knowing that none existed there, was the principal object of my visit to Mr. Huxley. It seems that Mr. Huxley had thought something of this kind would be well to do, but was not familiar with their habits or the food of the shad. Of course, on my part, I was only too happy to present details in regard to our shad. I may, perhaps, have rehearsed a great deal of that information we all get at our meetings. Anyhow, I told him that you would undoubtedly be glad to send over immediately by steamer a half dozen specimens on ice, a part of which he could preserve in alcohol at South Kensington, and the balance to be exhibited at the Norwich Fish Show. Mr. Huxley will, of course, give you credit for the same, both at the exhibition and at the museum. Mr. Huxley is also very desirous of knowing by what means he can secure millions of shad eggs the ensuing season, and I shall use my best exertions to aid in that matter, providing I can secure your valuable assistance. Just think that perhaps by our efforts we might succeed in giving some of these 35,000,000 English people as food, such a fish as the shad, and that there is a possibility that in eight or ten years these fish would be so abundant as to be had at a low price. Mr. Huxley will endeavor to convince landlords and those owning rivers that the modest shad will not eat up the aristocratic salmon. I want to add that I spent yesterday evening with Professor Huxley and met there a great many people, and they were informed of the proposed plan for the introduction of shad into English waters, and that fresh shad and eggs were to be sent to Norwich in the future. Mr. Chamberlain, M. P., for Birmingham, was very much interested, since the fish business may come under his supervision he has promised to do all in his power to advance it. Professor Huxley would like you to send a few fresh herrings with the shad, so that he may compare them with the English fish."

Mr. ROOSEVELT—I believe that Mr. Mather has eaten the shad of Germany and, perhaps, he will tell us how they compare with ours?

Mr. MATHER—The fish which is called shad in Europe is inferior to ours in flavor. In 1874, at the request of Prof. Baird I attempted to take young shad to Germany, but the attempt was a failure. At that time the question arose as to the comparative value of the two shads, some of the Germans holding that their maifish was as good as the American. This, of course, could not be decided by argument, and so it rested until last summer when at the Berlin Fishery Exhibition it occurred to Mr. von Behr, the well-known President of the German Fishery Association, to have some of their fish brought down for the American Commission to bring to the test of the knife and fork. Unfortunately, Prof. Goode and Mr. True were absent that day and I was alone. We had a gridiron improvised from wire, for this household implement is unknown in Germany, and some shad were broiled and some boiled and served with sauce after the German fashion. The broiled fish was pronounced best by all—five Germans and Prof. Ward, of Rochester, N. Y., and myself—but we did not think it equal to American shad by any means.

Mr. ROOSEVELT—Will Prof. Goode tell us the ichthyological differences between the American and the European fish?

Prof. GOODE—There is a difference observable in the scales which in the fish of Europe are thicker and do not lie as closely as in the American. There are other differences in the opercular bone which show them to be a different species.

An amendment to the constitution was then proposed by Mr. Mather to the effect that honorary members may be elected by a two-thirds vote of all members present at a regular meeting. Carried.

Mr. MATHER—I will now propose for honorary membership in this Association Dr. Theodatus Garlick, of Bedford, O., the first man to practice artificial fish culture in America. Carried unanimously.

The following paper was then read by the President:

ON HYBRIDIZING FISHES.

BY SETH GREEN.

Mr. President and Gentlemen of the American Fishcultural Association:—You have again met for the purpose of mutual benefit and an interchange of knowledge, such as has come under our observation during the past year.

The subject of hybridizing is one which has been demanding the attention of fishculturists, more or less, for the past few years, and whether any of the varieties of our fishes can be improved upon by crossing the different breeds is still a question. Of one thing we are certain, and that is, we would never know unless we tried.

We know that many varieties of stock have been greatly improved by putting together different strains, and also that fruits and vegetables have been rendered more palatable by grafting and other methods of infusing the sap of the different varieties into each other. These questions are of comparatively old standing, and it has been definitely decided in many cases which kinds will be improved upon by the process of hybridization. The field for experiment is large, and, as we live in a world of progression, there will doubtless be constant advances in these branches, as well as in other things.

Hybridization with fish for the purpose of bettering them, as food, and also producing fish suited to the nature of our different waters is the problem we are trying to solve. We cannot change the natural characteristics of our different bodies of water, and hence we find it necessary to produce varieties of fish which will thrive and multiply in them or learn from experiment and observation which species will do the most good when deposited in certain waters. With plants and animals it has been learned which varieties can be crossed advantageously, and which are productive of the best results, but with fish this has not been ascertained, but there is no question but what it will in time.

There are very many difficulties attending the hybridization of fish—much more so than in anything else. One of the troubles lies in keeping the experiment constantly under the eye, thus enabling you to watch the different stages of developement accurately, and the habits of water animals cannot be as closely observed as those on the land.

At different periods during my career as a fishculturist I have made several experiments with fish in hybridizing. The most successful one that I have been enabled to watch clear through has been brought out this winter. Three years ago, in the fall of 1877, at the New York State Hatchery, we crossed the female native brook trout with the male Lake Ontario salmon trout. A good percentage of the eggs taken and impregnated hatched. The offspring were healthy and they continued to thrive. The fish are a fine, trim-built fish, resembling both parents; they will weigh at the present time from three-fourths to one pound each. Last November they commenced to spawn for the first time. They commenced the first and continued until the 12th of November, during which time we succeeded in taking 19,400 spawn, the males and females both being fertile. The eggs hatched in about ninety days, the season being prolonged by the unusual cold winter.

The yolk sac has now disappeared and the young fry are feeding and doing well. The question now arises, Will they be capable of reproducing their own kind? My opinion is they will, but time will tell. I shall endeavor to put a few thousand into some of our lakes and streams and thus determine to what waters they are best adapted.

My next most successful experiment was with the cross between the California salmon and brook trout. They are now four years old and, like the salmon trout and brook trout hybrids, resemble both parents. The cross was made with female brook trout and male California salmon. Nearly all the fish have a deformed appearance; a few of them are perfect fish. Last season they exhibited signs of spawning. There were either no males among them, or, if there were, they were not fertile. On attempting to take the spawn from them the vent was found to be too small to pass the eggs. The aperture was enlarged and spawn taken and impregnated with brook trout milt. None of them hatched. The eggs were nearly the size of salmon eggs.

The parent fish have done well and some of them will weigh nearly, if not quite, two pounds. I do not think this cross will ever amount to anything. The salmon used were those kept in confinement and not as large or in as good condition as in their natural state.

I am of the opinion that if the perfect salmon and brook trout could be brought together a perfect cross might be made, or at least the experiment would be worth trying.

I have made several other experiments in hybridizing, such as crossing the hybrids with brook trout and also crossing them with salmon trout. I have also crossed the brook trout with the California mountain trout, all of which have been attended with more or less success.

I have this season been trying a series of experiments in impregnating the eggs of brook trout, the results of which will undoubtedly be interesting to the society. My first experiment was as follows: By using a small glass syringe I injected the milt of the male brook trout into the vent of the ripe female brook trout and left it there thirty minutes before taking the eggs. The result of this experiment was an impregnation of 75 per cent. In my second experiment I took the spawn from brook trout directly in a vial, and corked tightly, taking care that no water was allowed to get in. I then placed the vial under water and left it forty minutes, after which brook trout milt was put on them and remained in vial thirty minutes, the result of which was an impregnation of 75 per cent.

Third Experiment.—I injected milt of brook trout into ripe female, and allowed it to remain fourteen hours before taking. 15 per cent. of them proved to be good.

Fourth Experiment.—I injected milt of brook trout into ripe female, and allowed it to remain in fish twenty-four hours before taking. The experiment none of the eggs were fertilized.

Fifth Experiment.—I injected milt of brook trout into ripe female, and left it in fish one minute before taking. 40 per cent. was impregnated.

Sixth Experiment.—Took brook trout spawn in vial corked tightly, and placed under water for nine hours, after which milt was put on them. 15 per cent. of the eggs were impregnated.

Seventh Experiment.—Spawn was taken from female brook trout three hours after she had died, and milt from live male brook trout put on them. In this experiment 15 per cent. were found to be good.

As all fishculturists know the spawn of brook trout taken in the usual way adheres to the pan for from twenty minutes to half an hour directly after taking, we tried the experiment of putting them directly on the hatching trays within one minute after they were taken, and kept the pan in motion so they could not stick. The result of this experiment shows that the impregnation takes place almost instantaneously, as fully 95 per cent. were impregnated.

During last summer I spent considerable time on several of our inland lakes investigating them, and teaching the local inhabitants how to catch the fish with hook and line with which their waters have been stocked by the New York State Fish Commission. My efforts were attended with great success, I made several large catches, and taught many others how to do so. The effect will be to stop illegal modes of taking fish to a great extent in our inland waters.

When the people learn that they have a fish barrel at their door, and can take a fish dinner in a short time when they feel so disposed they will see to it that the laws are enforced.

I learned during my investigations that the alewives breed in our inland lakes. This I consider a very valuable discovery. As fish food their value is estimable, and all our lakes can be stocked with them. They are much wanted, also, in the fresh water hatching, for the reason that they spawn in the spring and the eggs hatch in a few days. Whereas, the herring cast their spawn in the fall and are all winter in hatching, and consequently a much larger percentage of them is destroyed. The alewife hatches at a low estimate one hundred and fifty young fry for every one of the herring.

It would be an impossibility to overstock any waters containing the alewives for food, and the fish found in the waters containing them are in the best possible condition. I hope to be able to stock several of our lakes with the alewife during the coming summer.

This winter has been unusually severe and the ice has formed to a great thickness, and snow has fallen upon it to considerable depth. In all small bodies of water, unless air holes are cut, there is always great mortality among the fish, caused by stagnation and lack of oxygen.

Many of our larger inland lakes that do not usually freeze entirely over have this season been covered in some instances with ice two feet in thickness. While this would not materially affect the fish in ordinary winters where this is of short duration, I am of the opinion that where it has extended over a period of several months a great many fish will be destroyed by suffocation.

Waters can easily be depleted in this way to a great extent and no one ever be the wiser, for, contrary to the general opinion that all fish float when dead, my experience is that not one in ten ever comes to the top of the water.

Mr. BLACKFORD—I would call attention to one remark made by Mr. Green on the death of fish below the ice. If this is the case generally we should take measures to prevent it, and perhaps it would be well to invite discussion of this subject.

Mr. ANNIN—I saw a pond on the Genesee Flats, this winter, which were frozen over, and contained perch, catfish, etc. The ice was three feet thick, but near the head was a small spring, and it was packed full of small fish, all alive.

Mr. MATHER—The case mentioned by Mr. Annin is different. In the winter of 1855 I was trapping about the Grant River, Wisconsin, and near it along the Mississippi. There were along the latter river numerous sloughs where in the overflows the fish were left. One of these I knew to be full of fish in the fall, and in the winter cut through the ice to spear them. They were all dead and the stench was fearful.

Mr. ROOSEVELT—Mr. Annin tends to confirm Mr. Green. The fish were distressed, and crowded to the spring holes for relief. If there had been no springs to make an opening the fish would have died.

Prof. GOODE—I do not care to argue this question, but having given some attention to the hibernation of fishes in cases where they assume a torpid condition and vitality seems suspended, it may be well to state that in Africa there are fishes which live in a state of estivation or a suspension of life in summer. They live in the mud when the ponds dry up, and wait for the rainy season to release them. We also know that in high Northern latitudes the fish go into a state of hibernation as the temperature falls to a certain point. Mr. Mather has published some experiments with mud-minnows. I should think that in some cases the instinct of hibernation might be hereditary, and often death might ensue while the fishes were torpid.

Dr. HUDSON—The question arises if a pond of large size freezes entirely over. Most large bodies of water have air holes.

Mr. MATHER—The one to which I referred on the Mississippi bottoms had no air hole. It was about three acres in extent, and perhaps five feet deep with two feet of that solid ice from shore to shore.

TO BE CONTINUED.

REPORT OF THE CONNECTICUT FISH COMMISSION.

THE fifteenth report of the Fish Commissioners of the State of Connecticut tells of the triumphs in restoring the salmon and shad to the Connecticut River and the introduction of the landlocked salmon, which is now doing well. During the last year brook trout have been reared and distributed and carp supplied by Prof. Baird were introduced. Some tables and results of Prof. Atwater's investigations in the chemical analysis of the flesh of fish are given, which we omit, as they will appear in full soon in his paper read at the fishcultural meeting.

The number of Penobscot salmon introduced into the State waters was less than in previous years owing to an accident at Dead Brook, near Bucksport, Me., where the fish had been penned by Mr. Charles G. Atkins, and from which they were swept by a freshet in August. Sixty thousand eggs were received and after hatching there were ten thousand planted in each of the following streams: West Brook, Thrall's South Brook, Thrall's North Brook and White Brook; Trout Brook received 12,000 and Birch Brook 6,000—58,000 in all. Since the law was passed to protect the salmon in the Connecticut which had been planted there, the report says: "It is a suggestive fact that all salmon seen by the fishermen since were found dead in the net! Of course, when a salmon was thus caught it would be useless to 'immediately restore it to the waters from which it was taken.' In truth, the capture of salmon goes on as if there were no laws; nearly all the 'dead' fish being sent to New York where they bring from a dollar to a dollar and fifty cents per pound—more than in any other salmon market. Only a few have been reported as caught the past season. It is a gratifying fact, however, to know that these few fish weighed from sixteen to thirty pounds apiece and were in excellent condition."

The Commissioners had asked for $500 additional to be applied to the propagation of salmon, but the Committee struck it out, alleging that it would be useless to propagate them if the fishermen were to take all the mature fish on their first return from the sea. Therefore no money has been spent in this direction the past year to the regret of the Commissioners who desire to make their success permanent. This state of things will be regretted by all, for the fact that the salmon had been restored to that river after an absence of more than thirty years was one of the grand triumphs of fishculture. The statement is made that the fish could not pass the Holyoke dam "to the headwaters of the river for spawning, as the fishway built there by Massachusetts is a failure." After speaking of the fact that for the first time since the inauguration of the salmon work in the New England States Connecticut has no part or lot in it it feelingly says: "Since the above was written Prof. Baird has generously awarded to the State 250,000 of the Penobscot salmon eggs belonging to the United States Commission, thereby adding another to the many favors heretofore received at his hands."

Ninety-one thousand fry of the landlocked salmon were hatched and distributed to nineteen waters within the State in lots of 5,000 each, except Colt's reservoir at Hartford, which only received 1,000. They say: "The operations for procuring the landlocked salmon have been continued at Grand Lake Stream, in Maine, as usual the past year, under the direction of Charles G. Atkins, Esq., for the joint account and benefit of the United States Commission and the States of Massachusetts and Connecticut. Mr. Atkin's scientific attainments, large experience and peculiar aptitude for this work have placed him in the foremost rank of successful fishculturists."

Of brook trout, there were 10,000 deposited in twenty-one streams. Messrs. James Rankin and B. Walker attempted to rear shad in salt water until the eggs ripened, intending to try and hatch them in the salt water, but sharks broke through the netting and released the male shad just before the eggs were ripe in the females. A chapter on the carp completes the report.

REPORT OF THE NEVADA COMMISSION.—The second biennial report of the Fish Commissioner of Nevada for the years 1879-80 is before us, dated December 31, 1880. On the adjournment of the last Legislature there were in the State hatchery over 200,000 McCloud river salmon fry, which were mostly deposited in the Truckee River, at Reno, with a few for the Carson River, the commissioner believing that the Truckee is as well adapted to this salmon as either the Columbia or the McCloud. One weighing over three pounds was taken in Pyramid Lake, evidently one of the plants of the California commission in Prosser Creek, a tributary of the Truckee.

The trout from the McCloud River, 2,500, received from Prof. Baird, have done well in one of the tributaries of the Carson. The catfish placed in Washoe Lake, and Humboldt, Carson and Truckee Rivers have multiplied rapidly. Washoe Lake is so fully stocked, and the fish so large and vigorous, that further planting there is useless. Over a hundred carp have been taken by our fishermen, some less than fourteen inches long and weighing from one pound to one and a half pounds. They have also done well in the Carson, Truckee and Humboldt rivers. The commissioner returns over half of his appropriation of $4,000, as he thinks it best to "go slow." He has no one to divide the responsibility with him and thinks it best to feel his way. With his surplus appropriation he will be able to stock many waters and introduce the carp.

A FISH COMMISSION FOR ARIZONA.—Arizona, March 30.—The Arizona Fish Commission is a creation of our own Legislature and is composed of Hon. John J. Gosper, Secretary of the Territory; Mr. Richard Hale, late Clerk of the Legislative Assembly editor of the *Nugget*, Tombstone, and Dr. J. H. Taggart, of Yuma. They were appointed by Gov. Fremont 16th of March, this year, to serve two years: no pay, but $500 was appropriated to pay expenses.—E. W. RICE.

NEW PUBLICATIONS.

POEMS OF MANY YEARS AND MANY PLACES is the appropriate title of a handsomely printed little volume, into which are gathered the poems of William Gibson. Published by Lee & Shepard, Boston. Price, $1.50.

LENOX DARE.—Virginia F. Townsend has written some of the most wholesome and pure stories in the list of American novels. In thousands of homes her books are to be found; through them she has become widely and pleasantly known to the public. The new book, "Lenox Dare," which has just come to us from the publishers, Messrs. Lee & Shepard, amply meets our expectation. It is one of those books telling the story of a life which has its many counterparts, and is therefore sure to awaken a responsive interest in thousands of readers. Price, $1.50.

The Kennel.

FIXTURES.

April 26, 27, 28 and 29, at New York City.—Westminster Kennel Club Fifth Annual Bench Show, American Institute Building, Third avenue and Sixty-third street. Entries close April 11. Charles Lincoln, Superintendent, No. 138 Fulton street, or P. O. Box 1,700, New York City.

September 1, at Pittsburgh, Pa. Close of entries Pennsylvania Field Trials. First Annual Derby. I. R. Stayton, Secretary, Pittsburgh, Pa.

October 1 at New York City. Close of entries Eastern Field Trials. Trials commence on Thanksgiving Day. Jacob Pentz, Secretary, P. O. Box 759, New York City.

A PURE LAVERACK SETTER IN THIS COUNTRY NOT GENERALLY KNOWN.

It is not generally known to breeders that at the time Fairy II. (now owned by Mr. Higgins of Delaware City) was imported, Mr. Tasker, from whom the writer purchased her, had ordered a blue setter pup from Mr. Laverack, and fully expecting both animals in time for the Centennial Beach Show, made his entries accordingly—in the bitch class, Fairy II. already named, and in the dog class a blue-ticked English puppy, not as yet named. Fairy II. arrived first, and just on the eve of the show the puppy reached him, but instead of a blue-ticked, the dog proved to be liver and white and named by Mr. Laverack Pride of the Border II. Mr. Tasker exhibited him at the Centennial Beach Show and I think at that time he was but eight or nine months old. Shortly after this the writer purchased Fairy II. and Mr. Tasker went to Texas to enter into the cattle business, taking Pride II. with him. He returned not many months afterward, disappointed in his enterprize. I met Mr. Tasker a few days since and, being interested in the whereabouts of such a valuable animal unknown to breeders to the country, learned that "the dog had turned out A1 and was now in the hands of Col. Hughes, president of a leading bank at Dallas, Texas.

Mr. Laverack wrote to the writer that "the young setter I have sent to your townsman, Mr. Tasker, will make a grand field dog if handled properly. I can breed no better." If I am not mistaken Pride II. was a Cora puppy.

I think it can be safely said that this dog is entirely unknown to the sportsmen of the East. Mr. Lincoln, Dr. Twaddell and Mr. John E. Long and a few who know of his importation may remember him. At the time of the Centennial show the dog, as I have said, was but a youngster, and, having just arrived, like my own Pedigree and Magnet, made a very sorry appearance. Exhibitors at the Baltimore show the following January had reason to be much surprised at the improvement of my brace. Pride II., before he was taken to Texas, was one of the grandest-made dogs I ever saw; his color liver and white was—against him, however.

HOMO.

NATIONAL AMERICAN KENNEL CLUB.

Subjoined is the full list of entries for the second annual Derby, for puppies born on or after April 1, 1880; entries closed April 1, 1881:

1 Capt. Pat. Henry enters Buckol, lemon and white setter dog, whelped July 1, 1880, by Pride of the South out of Cammie.
2 Capt. Pat. Henry enters Admir, black and white setter bitch, whelped July 1, 1880, by Pride of the South out of Cammie.
3 P. H. Bryson enters London, blue Belton setter dog, whelped July 22, 1880, by Gladstone out of Clip.
4 P. H. Bryson enters Memphe, blue Belton setter dog, whelped July 28, 1880, by Gladstone out of Juno.
5 D. Bryson enters Bessie T., black, white and tan setter bitch, whelped April 7, 1880, by Gladstone out of Floy.
6 J. H. Dew enters Gilda, blue Belton setter bitch, whelped April 7, 1880, by Gladstone out of Floy.
7 D. C. Sanborn enters Gertrude, white, black and tan setter bitch, whelped June 4, 1880, by Gladstone out of Nellie.
8 David McK. Lloyd enters Mack Laverack, lemon Belton setter dog, whelped April 2, 1880, by Thunder out of Peeress.
9 Jos. J. Snellenburg enters Lu Laverack, lemon Belton setter bitch, whelped April 2, 1880, by Thunder out of Peeress.
10 Jos. J. Snellenburg enters Pet Laverack, black and white setter bitch, whelped April 2, 1880, by Thunder out of Peeress.
11 Edward E. Hardy enters Clair, black and white setter dog, whelped May 15, 1880, by Dash III. out of Diana.
12 Edward E. Hardy enters Clairine, black and white setter bitch, whelped May 15, 1880, by Dash III. out of Diana.
13 Edward E. Hardy enters Pollux, black and white setter dog, whelped May 15, 1880, by Dash III. out of Diana.
14 Edward E. Hardy enters Saunterer, lemon and white setter dog, whelped April 20, 1880, by Scout out of Frost.
15 A. W. Blakemore enters Bonnie Scotland, white, black and tan setter dog, whelped May, 1880, by Lincoln out of Kansas Beauty.
16 L. H. Smith enters Sue Morton, black and tan setter bitch, whelped July 22, 1880, by Gladstone out of Clip.
17 L. H. Smith enters Lass of Kinsdale, blue Belton setter bitch, whelped July 22, 1880, by Gladstone out of Clip.
18 L. H. Smith enters Bristol, blue Belton setter dog, whelped Oct. 14, 1880, by Paris out of Coomassie.
19 L. H. Smith enters Dover, blue Belton setter dog, whelped July 22, 1880, by Gladstone out of Clip.
20 Clarence K. Drane enters Dashing Novice, white, black and tan setter bitch by Dash II out of Novel, whelped July, 1880.
21 Dr. N. Rowe enters Countess Peg, blue Belton setter bitch, whelped Sept. 25, 1880, by Daniel out of Peg.
22 E. F. Stoddard enters Doctor Bob, red Irish setter dog, whelped May 7, 1880, by Bob out of Friend.
23 E. F. Stoddard enters Lady Friend, red Irish setter bitch, whelped May 7, 1880, by Bob out of Friend.
24 Col. A. G. Sloo enters Gladys blue Belton setter bitch, whelped June 3, 1880, by Gladstone out of Nellie.
25 W. E. Hughes enters Cliffe, blue Belton setter bitch, whelped June, 1880, by Gladstone out of Nellie.
26 St. Louis Kennel Club enters Accident, liver and white pointer bitch by Faust out of Lassie, whelped Oct. 17, 1880.
27 St. Louis Kennel Club enters Mistake, liver and ticked pointer bitch by Bow out of June, whelped May 20, 1880.
28 A. J. Ealy enters Reform, white and black setter dog, whelped May 8, 1880, by Lincoln out of Kansas Beauty.
29 A. J. Ealy enters Sallie, blue Belton setter bitch, whelped April 7, 1880, by Gladstone out of Flog.
30 Wm. Seagur enters Smart, black and white setter dog, whelped April 12, 1880, by Hartley's Rake out of Pera.
31 J. W. Orth enters Fly, ——— setter bitch, whelped April 12, 1880, by Rake out of Pera.
32 J. D. Ladd enters Willie, black and white setter dog, whelped June 4, 1880, by Gladstone out of Nellie.
33 Sportman's Kennel enters Snow Flake, white and lemon setter dog, whelped May 16, 1880, by Prarie Ranger out of Highland Lassie.
34 Sportman's Kennel enters Judge, blue Belton setter dog, whelped May 20, 1880, by Shafto out of Jolly May.
35 Overman's Queen City Kennel enters Norwood, red Irish setter dog, whelped May 24, 1880, by Elcho out of Rose.
36 W. A. Givens enters Minerva 2nd, blue Belton setter bitch, whelped April 4, 1880, by Rock, Jr., out of Minerva.
37 J. R. Hendricks enters Lora Laverack, blue Belton setter bitch, whelped by Young Laverack out of Petrel II.
38 Harvard Kennel Club enters Bess, black and white setter bitch, whelped May 24, 1880, by Dash III out of Countess II.
39 Harvard Kennel Club enters Roll, liver and white setter dog, whelped Aug. 21, 1880, by Dash III out of Countess Ada.
40 Harvard Kennel Club enters Ruby, black and white setter bitch, whelped Aug. 21, 1880, by Dash III out of Countess Ada.
41 Harvard Kennel Club enters Rap, black and white setter dog, whelped Aug. 21, 1880, by Dash III out of Countess Ada.
42 Harvard Kennel Club enters Rose, black, white and ticked setter dog, whelped Aug. 21, 1880, by Dash III out of Countess Ada.
43 W. B. Gates enters Tom Paine, white, black and ticked setter dog, whelped June 4, 1880, by Gladstone out of Sanborn's Nellie.
44 W. B. Gates enters Twin Maude, black, white and tan setter bitch, whelped July 22, 1880, by Gladstone out of Clip.
45 Arthur Merriman enters Oliver Twist, black, white and tan setter dog, whelped June 4, 1880, by Gladstone out of Nellie.
46 Ed. J. Carr enters Shadow, black, white and tan setter bitch, whelped Sept. 11, 1880, by Lincoln out of Daisy Dean.
47 Geo. C. Milner enters Prince Lolty, lemon Belton setter dog, whelped May, 1880, by Lolty out of Dol.
48 George Norbury Appold enters Rockwell, red Irish setter dog, whelped April, 1880, by Palmerston II out of Eva.

THE "BENCH-LEGGED" BEAGLE QUESTION.

Editor Forest and Stream:

In your issue of 31st ult. appeared an article under the above caption and signed "Beagles." I request that inasmuch as I have written over my own signature, and am therefore recognized, and as the author of the articles questioning my statements assumes a cognomen which, upon the face of it, seems to claim to speak, or write *ex cathedra* he should certainly appear before the public in the same category with myself—in other words, over his own name.

When any one assumes to speak as I have done in reference to matters of which I profess to have knowledge, and the statement is called in question, he as well as the public have a right to know who the disputant is. Nor should a gentleman hesitate who occupies the latter position to let the party challenged, as well as the public at large, know whether he is entitled to responsibility in the premises.

In brief, whenever the gentleman who assumes by his signature "Beagles" to know so much gives his name I hold myself ready to answer his every interrogatory and make good all that I have heretofore asserted. Hark out from your cover, "Beagles." Real name and then real issues.

DR. MADDUX.

Baltimore, Md., April 4.

WOODCHUCK DOG CHAT.

I NOTICED a letter in FOREST AND STREAM of March 24 that some one wants a "woodchuck dog." What kind of a dog is that? I have seen Newfoundlands, setters, pointers, spaniels, terriers, bulldogs, beagles, fox-hounds and mastiffs, besides pretty nearly every kind of a dog that can run on three legs, but I am going to tell you about a little dog that can kill woodchucks about as fast as terriers will hunt a rabbit. He is a queer little fellow—all ears and body. When I am on my fishing trips up in Michigan he is generally the first to meet me when the steamer pulls up at the village dock; his "Yap, yap" greets me before I can meet the warm grasp of friends. When I have changed my city clothes for a dead-grass fishing suit and get outdoors again he is waiting for a hunt. "Well, Fide, where's the woodchuck?" sets him off. I cannot give his pedigree, because he hasn't any. He has no pride of ancestry, for he is a cur, without claim to any particular breed; in fact he is probably a combination of half a dozen breeds. Yet, for all that he is a faithful little watch-dog and will hunt woodchucks until he is ready to drop. Here's a pen-picture of him:

A long body; short, dapper little legs; a long snout; bright, sparkling eyes; awful long ears. These are the marked features in the dog. As he lies they are constantly erect, like a jack rabbit's, and move backward and forward. While he is awake he is listening for something, but he isn't a "yaller dawg;" in color he is a dark brown and as sleek as a mole.

I left the cause for the brush, and was intent on fronting, when "Yap, yap, yap" came the ringing bark of Fide. He was calling for me. I know he had a woodchuck somewhere. I have called him, "Where are you?" Following the sound of his voice through the thick woods I came to a wood-pile, where Fide was bouncing around as fast as his little legs would carry him. The chuck was secure in the pile. Cutting a long stick I began to push and poke. Finally I heard a rush, a squeal, a scrambling and snarling, then a yelp, but before I could run around the pile, climbing logs to do so, Fide had caught him by the back of his neck and sent him flying into the air, and it came down a kicking chuck. Fide lay panting beside him, bleeding at the nose with a nip the chuck had given him, but intently watching to see if he was playing "possum." Just how it was done I cannot say, for it was a running chuck, a scrambling dog, both of them rumbling over and through the underbrush until his chance came for the death grip, then he gave it quick as a wink. He can do this at any time and will hunt a mile for woodchucks.

I am inclined to think Fide is a species of the smooth-haired terrier, with something like the dachshund in him. He can trail rabbits, hunt squirrels, trail woodchucks and gophers. He is grit to the backbone and will hang on when once he bites. So much of a pet is he that his mistress has refused a handsome cocker spaniel that we offered to send them.

I think if the friend of "Lepus" could get a rough-haired red Fide he would soon make the woodchucks scarce. They can watch a hole as long as any dog we ever saw when game is there. We have seen them hunting otter. Phew! Fide's howling there is when one of them gets bit; but they are back again in the thick of the fight the moment the otter makes a rush for the water.

We have never considered any dog as special for hunting woodchucks, because at the farm we visit and at the trout creek both dogs will kill them until it is a difficult matter to find any to hunt.

Our observation has induced us to think that any plucky dog can be trained to kill woodchuck, because a dog never forgets the first bite of a rat or the first nip of a woodchuck, and from that time becomes the sworn enemy of both these animals. NORMAN.

Chicago, Ill.

Editor Forest and Stream: RANGELEY, Me.

While the subject of woodchuck dogs is being discussed I wish to chronicle the achievements of an imported English setter. Finding a burrow that was occupied Sanché would take a position where he could observe it, his head only exposed. Thus for hours would he wait, if necessary, for chuckie to come forth, waiting until his game had placed a proper distance between himself and the burrow; then, with a rush toward the burrow, he would intercept and kill his quarry, never miscalculating his distance. In this connection I cannot forbear relating other achievements showing remarkable intelligence. Taking an empty jug from any part of the farm to the house to be re-filled with water; seeking the mistress and making known his errand; going to any part of the lots for a farming tool or forgotten garment were a few of the many that might be mentioned. As a bird dog he had few equals—no superiors. So, too, as a watch-dog Sancho excelled. He would allow no stranger on the premises after dark, and if disturbed about the stock at the stables he promptly notified his master. For the children he was a gentle companion and staunch protector. A quicker, more peaceable dog never existed. Still, he would brook no insult or abuse from man or his own species. One instance of the latter in point: There was at the neighboring village the veritable "big yellow dog," a terrible tyrant, whose chief delight it was to pounce upon all passing dogs. One day, while Sancho was trotting beneath his master's wagon, the bully jumped in for a fight, and he got it: for, although much larger and always before a victor, yet in less than a minute he fled ingloriously from the field. WARFIELD.

ERRATA.—In the short article entitled "Those Nervous Dogs" in our last issue, our correspondent "Homo" was made by the types to say (7th line) "expressly on bird dogs," whereas he had written "excessively in bred dogs;" and (3d line from end) the types had it "nervous instability," whereas the copy read "nervous irritability."

NOTES FROM ABROAD.

Mr. C. S. Fauntleroy lost by death, on the 15th inst., his grand old setter bitch, Snake, at the ripe age of fourteen years. Snake had a great preference for; she was well made, a true setter, although not so fashionable as some, yet she won many first prizes, including Crystal Palace, 1871, and also scored a first at the Southampton Field Trials of that year.

Snake's progeny have turned out well, both here and in America, she being dam and grand-dam of such good ones as Die, winner of Field Trial Derby, 1877, and Darkie, winner of Challenge Cup, 1879; and of her immediate daughters, Mr. Fauntleroy has still the well-known Prue, by Reid's Sam, and two by Blue Prince—SIRIUS, *in the Stock Keeper.*

ACCIDENT TO FOXHOUNDS.—Lord Fitzhardinge's well-known pack of foxhounds have had a narrow escape from being cut to pieces. While hunting in the vicinity of the Midland Railway at Cossington, near Dursley, the fox crossed the line, and as the two leading hounds were following an express train came up and killed one of the dogs, a very valuable one, on the spot, and injured the other. Had the train been a little later the whole pack would have been on the line.

SHOCKING DEATH FROM HYDROPHOBIA.—A fearful death occurred at Penwortham, near Preston, on Tuesday, from Hydrophobia. A gamekeeper, a fine, stalwart man, named Peter Green, in the employ of Mr. L. Hawsthorne, was last Whitsuntide bitten at Tyldesley by a stray dog. He sucked the wound in his right thumb and had it cauterized. On Sunday last he felt a peculiar pain in his hand. Having on several occasions been in charge of persons suffering from hydrophobia he suspected the symptoms and sent for Dr. Bell, of Preston. This gentleman found hydrophobia quickly developing. The man rapidly became worse, and on Tuesday was so violent that he had to be bound to the bed by ropes and held by several persons. All medical skill was unavailing, and he died in the afternoon.—*Stock Keeper.*

I am informed that the Cologne Field Trials will take place on the 11th and 12th of April, the draw being on the evening of the 10th.

H. S. H. Prince Albert Solms, of Braunfels, has entered Champion Ranger, whom he has lately purchased of Mr. Macdons, and, in event of the grand old dog carrying off the stake, has generously offered an extra third prize, which will be of equal value to the second.—SENEX, *in the Live Stock Journal.*
